INTRODUCTION

IN this, the third year of war, we again offer to our readers a survey and record of the year planned and carried through on the same scheme as proved so successful for the year books issued in 1941 and 1940.

In pre-war years the BRITANNICA YEAR BOOK was issued in two separate but similar editions, one for American circulation and one for circulation in Great Britain and the British Empire. The need for economy in materials and in man power compelled the publishers to retain one edition only and war conditions dictated that that should be the American edition. Only in the United States has it been possible to produce a major work of this character.

As before, the volume is prefaced by an introductory supplement of some thirty thousand words, dealing in detail with war time topics of specific interest to British readers.

To non-American readers the 1940 and 1941 year books, which included many hundreds of thousands of words from British contributors, proved to have a special interest and value ; in the present circumstances of alliance and close co-operation the publishers confidently expect that an even more valuable service will be performed by this, the 1942 BRITANNICA BOOK OF THE YEAR.

M. D. LAW.

LONDON, *March* 1942.

LIST OF CONTRIBUTORS AND CONTENTS

DIARY OF EVENTS THROUGHOUT THE BRITISH EMPIRE

EXCLUDING THE COURSE OF HOSTILITIES

From January 1, 1941—December 31, 1941

1941

Jan. 1: **Australia.**—It was announced that 496 survivors of British, French and Norwegian ships, including some women and children, who had been landed by German commerce raiders on the island of Emirau in the Bismarck archipelago on Dec. 21, had been rescued by naval units and brought into an Australian port.

Jan. 3: **India.**—Under the Defence of India rules Maulana Abdul Kalam Azad, president of the Congress party, was arrested.

Jan. 5: **United Kingdom.**—Baling out from an aircraft which dived into the Thames estuary, Miss Amy Johnson, the airwoman, was drowned.

Jan. 7: **United Kingdom.** The archbishop of York's conference opened at Malvern to discuss the Church's opportunity for inspiration with regard to a new order of society after the war.

Jan. 8: **Kenya.**—Lord Baden-Powell, the chief scout, died in his 84th year.

Jan. 9: **United Kingdom.**—In reply to President Roosevelt's personal request, the British government agreed to allow from America limited supplies of vitamin concentrates, condensed milk and babies' clothing into unoccupied France.

The ministry of food announced that the weekly meat ration, which on Jan. 6 was reduced to 1*s.*, and from that date included pork and most offals, would be fixed weekly within the range of 1*s.* to 1*s.* 6*d.*

Jan. 15: **Canada.**—Disagreement over consideration of the Rowell-Sirois report led to a breakdown of the dominion and provincial governments conference at Ottawa on financial and constitutional reforms.

Jan. 16: **United Kingdom.**—It was announced that monetary aid from the colonial empire by the end of 1940 totalled over £18,250,000.

Jan. 17: **United Kingdom.**—Promotion of music and art in war-time was guaranteed by a further grant of £12,500 from the Pilgrim Trust to the Council for the Encouragement of Music and the Arts, and a similar allocation from the treasury.

Jan. 20: **United Kingdom.**—Orders were issued giving details of the government's scheme for compulsory fire-prevention.

Jan. 21: **United Kingdom.**—Mr. Bevin in the House of Commons outlined his plan for industrial registration by age groups.

The Daily Worker and *Week* were suspended under Defence Regulations.

India.—Announcement was made of a resolution by Sikh leaders to form a Defence of India League to secure the maximum effort by the Sikhs in defence of India and to ensure British victory.

Jan. 25: **Hong Kong.**—The King replied to the resolution of devotion and loyalty passed by the legislative council on the 100th anniversary of the colony's foundation.

Jan. 26: **Australia.**—Serious losses in life and property were reported from the worst floods in the history of South Australia.

Jan. 27: **South Africa.**—Additional estimates for war expenditure totalling £15,000,000 were proposed in parliament.

Jan. 29: **United Kingdom.**—The King signed a proclamation extending the application of the National Service Act to six new age groups—men of 18, 19, 37, 38, 39 and 40.

Feb. 1: **United Kingdom.**—The new Air Training Corps was constituted.

South Africa.—Many people, mostly soldiers on leave, were injured in Johannesburg in serious political rioting, arising from street clashes between soldiers and members of the Ossewabrandwag.

Feb. 4: **United Kingdom.**—Stories were disclosed of the abnormally severe weather experienced in early and mid-January.

South Africa. A national security code for the Union and South-west Africa was promulgated with immediate application.

Feb. 6: **United Kingdom.**—New schedules for world broadcasting, totalling 54 programme hours daily, were announced by the director-general of the B.B.C.

Calling for a vote of credit of £1,000,000,000 for 1941-42, the chancellor of the exchequer said that the daily cost of the war had risen to over £10,500,000.

Feb. 13: **United Kingdom.**—Sir Kinahan Cornwallis was appointed ambassador in Baghdad.

Canada.—It was announced that during the year the government were to construct a chain of airports from Alberta to the Yukon as a defence measure.

Feb. 18: **Canada.**—The largest budget in dominion history called for an appropriation of £290,000,000 for war purposes.

Northern Rhodesia.—Findings were published of the commission of inquiry into the April 1940 disturbances in the Copperbelt.

Feb. 20: **Malta.**—Regulations were issued for compulsory service of males between the ages of 18 and 41 in combatant capacities. Those between the ages of 16 and 56 became liable for other duties.

United Kingdom. After a tour of inspection of the A.I.F. in the middle east, Mr. Menzies, prime minister of Australia, arrived in England.

Feb. 23: **United Kingdom.**—Mr. Amery, secretary of state for India, broadcast on India's part in the war and emphasized that the declared goal of British policy for India was her free and equal partnership in the British commonwealth.

Feb. 24: **Newfoundland.**—Sir Frederick Banting, discoverer of the insulin treatment for diabetes, who had been missing since Feb. 21, was found dead in aeroplane wreckage at Trinity Bay.

March 1: **New Zealand.**—The free medical service provided for in the Social Security Act came into operation.

March 3: **United Kingdom.**—To assist the national food and shipping problem, reductions in service rations were announced.

News was released of the great snowstorm in the north in February, believed to be the most severe since 1888.

March 5: **Eire.**—Mr. Frank Aiken, minister for the co-ordination of defence measures, left for the U.S. on an arms-and supply-buying mission.

March 10: **United Kingdom.**—An order was made restricting meals in hotels and catering establishments to one of five main dishes—fish, meat, poultry, eggs or cheese.

March 12: **United Kingdom.**—*Die Zeitung*, a German language newspaper, made its first appearance in London.

South Africa. The new budget introduced many tax increases and provided for a total defence expenditure of £72,000,000, the balance to be obtained by loan.

Jamaica.—Suggested constitutional changes in Jamaica were announced in the British House of Commons.

March 15: **New Zealand.**—It was announced by the New Zealand high commissioner in London that 20 estates comprising 29,000 acres had already been bought by the New Zealand government for settlement of dominion soldiers after the war.

March 16: **United Kingdom.**—Mr. Ernest Bevin announced new arrangements to increase man- and woman-power for work of national importance, involving the registration of men between 41 and 45, and of women of 20 and 21.

March 17: **United Kingdom.**—Jam, marmalade, syrup and treacle were rationed, the allowance being 8 oz. of any one of these per person monthly.

Eire.—In a St. Patrick's day broadcast to the U.S.A., Mr. de Valera said that neutrality represented the determined will of the Irish people.

March 18: **India.**—The chamber of princes adopted a resolution calling for the establishment of a war advisory council through which the Indian States could co-operate with the provincial governments in prosecution of the war.

March 19: **Canada.**—An agreement was signed with the United States for the immediate development of the Great Lakes and the St. Lawrence river seaway and power project.

March 23: **United Kingdom.**—The King and Queen with the two princesses observed the national day of prayer in a small country church. Throughout the Empire people joined in the day's observances.

March 25: **United Kingdom.**—The minister of food announced that communal

feeding centres, already established in over 100 towns, were being renamed "British Restaurants." In the London area 147 had been set up.

March 26: **United Kingdom.**—The War Damage bill became law, and the National Service bill to make civil defence compulsory passed its second reading by 176 to 4.

March 31: **Burma.**—The new flag was hoisted by the governor, Sir Archibald Cochrane, at a ceremony in Rangoon.

Borneo.—On the occasion of the centenary of the Brooke rule in Sarawak, the Rajah, Sir Charles Vyner Brooke, renounced the absolute legislative power and proposed that the committee of administration be entrusted with the drafting of a liberal constitution.

April 1: **United Kingdom.**—Supplies of animal feeding-stuffs were reduced to ⅛ of pre-war rations.

April 2: **Eire.**—Tea was rationed, the allowance being 1 oz. per person weekly.

April 4: **Australia.**—The projected establishment of a permanent joint committee with New Zealand to discuss common defence and economic problems was announced.

April 6: **The War.**—The Germans attacked Yugoslavia and Greece.

April 7: **United Kingdom.**—In the new budget income tax was raised to 10*s.* in the pound.

April 9: **United Kingdom.**—Total war casualties to date were given as 29,856 civilians killed, and 40,897 wounded, and 37,607 members of the armed forces killed and missing and 25,895 wounded.

April 14: **United Kingdom.**—The war savings campaign reached the £700,000,000 mark.

April 16: **United Kingdom.**—The last remaining Crystal Palace tower was demolished, providing 800 tons of scrap iron.

April 17: **Kenya.**—The governor announced a forthcoming excess profits tax of not less than 60 per cent. Similar measures were being taken in Tanganyika, Uganda and Zanzibar.

United Kingdom.—The business assets insurance scheme under the War Damage Act came into operation.

Palestine.—The Emir Abdul Ilah, regent of Iraq, arrived in Jerusalem, whither he had fled after the Iraqi revolt.

April 19: **United Kingdom.**—The first registration of women under the Employment Order 1941, comprising the 1920 class, took place.

April 21: **India.**—Fifty people were reported killed and more than 300 injured in three-day riots at Ahmedabad between Sikhs and Moslems.

April 22: **United Kingdom.**—The British Empire medal was instituted as a military and civil award.

April 24: **South Africa.**—It was announced that, owing to the short wheat crop, a standard wholemeal loaf would replace white bread throughout the Union on May 1.

April 30: **Canada.**—New taxes and substantial increases in existing taxation were imposed in the new budget, to provide an additional revenue of $300,000,000 annually.

Eire.—The Dail voted £8,383,556 for the army for 1941–42.

May 1: **United Kingdom.**—Lord Beaverbrook was appointed minister of state, and Col. Moore-Brabazon minister of aircraft production. A peerage was conferred on Mr. F. J. Leathers, who was appointed minister of shipping and transport.

May 4: **United Kingdom.**—Double summer time came into operation, clocks being put forward two hours in advance of Greenwich mean time.

May 5: **Northern Rhodesia.**—The government offered £296,000 to Britain for the war effort, £50,000 to be for fighter aircraft.

United Kingdom.—Cheese was rationed.

May 6: **South Africa.**—Parliament adjourned after a session in which a number of social measures passed included a workmen's compensation act, a factories' act and an act to enable South African soldiers outside the Union to vote in the South African elections.

May 7: **United Kingdom.**—A vote of confidence in the government was carried by 447 votes to 3. Mr. Churchill replied in parliament to critics of his policy.

Eire.—In the new budget income tax was raised to 7*s.* 6*d.* in the pound.

Canada.—Mr. Menzies, prime minister of Australia, addressed the Commons from the floor of the house.

May 8: **United Kingdom.**—A new charter for seamen provided, among other measures, for a merchant navy reserve pool.

May 10: **United Kingdom.**—Rudolf Hess, Hitler's deputy, landed by parachute near Glasgow and later was held as a prisoner of state.

May 14: **Nyasaland.**—A gift of £39,150 to Britain marked the 50th anniversary of the protectorate.

May 19: **United Kingdom.**—War credits to date amounted to £4,800,000,000, and the total increase in taxation since the autumn of 1939 was £788,000,000.

May 20: **United Kingdom.**—The Fire Services (Emergency Provisions) bill, authorizing the government to establish a national fire brigade service in war-time, passed all its stages.

May 24: **South Africa.**—The King conferred field-marshal's rank on Gen. Smuts on his 71st birthday.

May 28: **India.**—Communal disturbances in Bombay resulted in the deaths of 29 people and a total of 178 injured.

June 3: **United Kingdom.**—Clothing, including footwear, was rationed. Each person was allowed 66 clothing coupons for 12 months.

June 6: **Australia.**—The minister for air announced that a Royal Australian air cadet corps was to be constituted on the lines of that in the United Kingdom.

June 11: **New Zealand.**—Married men from 18 to 45 were ordered by proclamation to enrol for military service. Men of 21 to 40 would be balloted for overseas service.

June 12: **India.**—Details were published of the destruction caused by cyclone in Bengal on May 25, when more than 4,000 people were killed.

June 13: **United Kingdom.**—Civilian casualties for April were 6,065 killed, 6,926 injured; for May, 5,394 killed, 5,181 injured and 75 missing.

India.—Under a reorganization scheme involving units of the Indian Territorial force, it was stated that five new regiments were being added to the Indian army.

June 14: **United Kingdom.**—Changes in the food rationing system included an increase in the domestic cheese ration and reduction of the butter ration from June 30, and doubling of the preserves ration from August.

June 17: **Australia.**—New measures for expanding the war effort included the appointment of a minister of supply and a minister to co-ordinate civil defence, further petrol rationing, immediate prohibition of strikes and lock-outs, and enlistment of women for war industries.

June 18: **Canada.**—More than 2,400 Canadians were stated to be studying for service as radio-location operators in Britain.

United Kingdom.—Owen Tudor, ridden by W. Nevett, won the New Derby at Newmarket.

June 20: **United Kingdom.**—Mr. Fraser, prime minister of New Zealand, arrived by air.

June 22: **The War.**—Russia, invaded by Germany, was promised full aid by Mr. Churchill.

June 26: **United Kingdom.**—The Commons passed the Goods and Services (Price Control) bill.

June 29: **United Kingdom.**—Lord Beaverbrook was appointed minister of supply, Sir Andrew Duncan, president of the board of trade, and Mr. Oliver Lyttelton to special duties abroad.

July 1: **United Kingdom.**—The secretary for petroleum announced a reduction of one-sixth in the basic ration of petrol for private cars in the August, September and October period.

Australia.—Senator James Cunningham, deputy leader of the Labour opposition, was elected president of the senate.

July 2: **United Kingdom.**—It was disclosed that the first three weeks of June had provided the most extraordinary June weather on record. Only 11 days after the coldest June day for five years London experienced the hottest June day on record.

July 3: **Newfoundland.**—For the first time for many years the budget showed a surplus of income over expenditure. From the surplus it was decided to present $500,000 to Britain for a fighter aircraft squadron, to be manned by Newfoundlanders.

July 5: **Canada.**—To provide Britain with Canadian dollars, the government advanced £325,000,000 to the foreign exchange control board.

July 8: **United Kingdom.**—The final figure for the whole of the war weapons weeks in the national savings campaign was announced as £395,000,000.

Australia.—The air minister stated that expenditure on the Royal Australian air force in the current financial year would exceed £A.1,000,000 a week.

July 11: **Australia.**—Net war expenditure in the year ended June 30 was £A.169,857,000, which was £A.5,500,000 less than the estimate. Revenue for the year was £A.2,121,000 above the estimate. The income tax yield was more than double that of the previous year.

July 17: **New Zealand.**—The second war budget estimated the country's war expenditure at £69,700,000.

July 20; **United Kingdom.**—Government changes included the appointment of Mr. Duff Cooper, chancellor of the Duchy of Lancaster, to a special mission in the far east; of Mr. R. A. Butler as president of the board of education; of Mr. Brendan Bracken to be minister of information.

July 21: **India.**—Exchange of representatives between India and America having been agreed upon, Sir Girja

Shankar Bajpai was appointed the Indian representative, to be styled agent-general.

July 22: **Straits Settlements.**—Rumours of impending British action in Indo-China were denied in an official broadcast in English and French from Singapore.

India.—The secretary of state for India announced that the governor-general's executive council would be enlarged and a national defence council established.

July 27: **Canada.**—The minister for trade and commerce announced the conclusion of an agreement under which two-thirds of British Columbia's canned salmon for 1941, expected to amount to more than 1,000,000 cases, would be sent to Britain.

United Kingdom.—An important stage in the growth of Liverpool cathedral was reached when the old and new sections were used for the first time together. Removal of the temporary dividing wall revealed a vista of much grandeur.

India.—The second session of the conference of non-party leaders was opened at Poona by Sir Tej Bahadur Sapru, who reviewed events since the Bombay conference.

July 30: **India.**—Membership of National Congress showed a rapid decline under Mr. Gandhi's policy of non-violent pacifism in relation to the war. Before the outbreak of war members numbered some 4,500,000. In 1939–40 there were 3,000,000 and in 1941 the total was little over 1,500,000.

Aug. 7: **Eire.**—It was announced that sugar would be rationed on the basis of 1 lb. a week per person.

Aug. 10: **United Kingdom.**—Double summer time ended and clocks were put back one hour.

Aug. 11: **United Kingdom.**—Reclaimed land in East Sussex, some of which had been unproductive for centuries, would yield, it was stated, crops worth £85,000 in 1941.

Australia.—The conference of premiers decided to spend £A.1,000,000 on A.R.P. in vulnerable areas, half to be paid by the commonwealth, and £A.85,000 on supplementary measures, including anti-gas equipment.

United Kingdom.—Friendly Germans, Austrians and Italians in the country began to register for war work.

It was stated that savings stamps to the value of about £20,000,000 had been bought since the inception of the war savings campaign.

Aug. 13: **South Africa.**—At the Transvaal congress of the Herenigde party, summoned to consider the adoption of the federal council's declaration of policy, Dr. Malan, the leader, condemned Mr. Pirow's campaign for a "new order" based on National Socialism.

Aug. 14: **United Kingdom.**—Mr. Attlee announced in a broadcast that Mr. Churchill and President Roosevelt had met at sea and agreed on the eight-point "Atlantic charter" of peace aims.

Aug. 15: **United Kingdom.**—With a message to Sir Claud Auchinleck, the Queen opened the new airgraph letter service to forces in the middle east.

Aug. 20: **United Kingdom.**—Mr. Mackenzie King, Canadian premier, arrived in the country.

Aug. 22: **Jamaica.**—After a three days' debate the legislature rejected the proposals for a new constitution, and an amendment favouring full representative government was adopted by the legislative council.

Aug. 25: **Australia.**—Mr. Menzies's proposal for a national government was rejected by the Labour party, who demanded the resignation of his government.

India.—The premiers of the Punjab and of Assam resigned from the national defence council under pressure from the Moslem League.

Aug. 28: **United Kingdom.**—The minister of war transport announced a new financial agreement under which the government would make an annual payment of £43,000,000 to the four controlled railway companies and the London Passenger Transport Board.

Aug. 28: **Canada.**—Under a contract to become operative in October the government agreed to provide Britain with 600,000,000 lb. of bacon in a year.

Aug. 29: **Australia.**—Commissioned to form a new cabinet, following the resignation of Mr. Menzies on Aug. 28, Mr. Fadden announced that there would be for the present no changes in the ministry. Mr. Menzies would retain the portfolio of defence co-ordination.

Sept. 4: **Kenya.**—The compulsory registration of British European women between 18 and 60 for war work was announced.

Sept. 6: **United Kingdom.**—Details were announced of arrangements for the compulsory registration of men between 18 and 60 for fire guard duties.

Sept. 7: **United Kingdom.**—The first Sunday following the second anniversary of the war was observed as a national day of prayer.

Sept. 8: **Canada.**—Production of motor cars for sale in 1942 was reduced by an order in council to 44 per cent of the 1940 figure.

Sept. 10: **India.**—Mr. Fazlul Huq, premier of Bengal, resigned from the defence council and from the working committee and council of the Moslem League in protest against Mr. Jinnah's attitude to participation in the viceroy's defence council.

New Zealand.—Mr. Nash, acting premier, announced in parliament that the King had approved of the designation of the New Zealand naval forces as the "Royal New Zealand Navy."

Sept. 12: **United Kingdom.**—A political warfare committee, responsible to the foreign secretary and the ministers of information and economic warfare, was set up.

Sept. 14: **Canada.**—Roman Catholics and Protestants alike observed a reconsecration week throughout the country.

United Kingdom.—Details of the reorganization of the fire fighting services as a national fire service, brought secretly into operation on Aug. 18, were disclosed. The scheme involved the reconstitution of 1,400 fire brigades as 33 fire forces conducted on an entirely new system.

Sept. 15: **India.**—The voluntary conversion of the Territorial force into regular units became effective, and it was stated that more than 75 per cent of the Territorials had volunteered for full military service.

Sept. 17: **United Kingdom.**—The National Trust for Scotland announced that the famous falls of Glomach in Ross-shire were to be handed over to their custody.

Sept. 18: **United Kingdom.**—The result of 21 months' salvage collection by those local authorities which made returns to the salvage department of the ministry of supply was stated to be a total of 1,550,000 tons of waste material, which was resold to industry for £3,700,000.

Sept. 24: **Sarawak.**—On the centenary of the state, the new constitution was approved.

Sept. 25: **Australia.**—Mr. Fadden agreed to the appointment of a royal commission of inquiry into the allegations against the government regarding the use of "secret funds" for counter-propaganda against subversive elements.

New tax measures to meet a proposed expenditure of £A.217,000,000 for war purposes were outlined by the prime minister in the new budget.

Oct. 3: **United Kingdom.**—Col. J. J. Llewellin, joint parliamentary secretary to the ministry of war transport, stated that in the second year of war 10,073 people had been killed on the roads, against a pre-war average of 6,500 deaths a year.

Australia.—A vote of censure on the government on the budget was carried by 36 votes to 33. On Mr. Fadden's resignation Mr. Curtin undertook to form a new government.

The royal commission investigating the alleged use of public money for activities of the Australian Democratic front opened its inquiries.

Oct. 6: **United Kingdom.**—The total raised in small savings since the inauguration of the national savings campaign in November 1939 passed the £1,000,000,000 mark.

Australia.—Mr. Curtin announced his new Labour administration in which he himself took over the portfolio of defence co-ordination.

India.—The first meeting of the new national defence council was opened by the viceroy.

Northern Rhodesia and Kenya.—Reconstruction of the Great North Road between Northern Rhodesia and Kenya to an all-weather standard at a cost of £355,000 was decided upon by the war office.

Oct. 7: **United Kingdom.**—The secretary for war announced in parliament that last minute demands by the German government had caused the cancellation of plans for the exchange with Germany of sick and wounded prisoners of war.

Australia.—A bill authorizing a loan of £A.50,000,000 was passed in parliament.

Mr. Fadden was elected opposition leader by the United Australia and Country parties.

Oct. 13: **Straits Settlements.**—At the budget meeting of the legislative council a revenue of 59,700,000 Straits dollars was estimated for 1942, against an expenditure of $58,200,000.

Oct. 14: **Canada.**—The national income was stated to have reached a higher level than ever known in dominion history. At $3,446,000,000 in the first eight months of 1941 it showed an increase of 10·5 per cent over the same period in 1940.

India.—Census returns for 1941 showed that the total population was 388,800,000.

Oct. 15: **New Zealand.**—It was decided to postpone the general election to avoid disruption of national unity in the war effort, and a bill extending the life of

parliament to Nov. 1, 1942, was passed without a division.

Oct. 16: **United Kingdom.**—The appeal to the House of Lords by Antonio Mancini against his conviction for murder was dismissed. Mancini had appealed on a point of law against the refusal by the Court of Criminal Appeal to quash the conviction of the Central Criminal Court.

Australia.—The establishment of a Japanese air line to Timor was stigmatized in the press as a provocative act.

Oct. 17: **Australia.**—The government undertook to send £1,000,000 worth of railway stock to Iran.

India.—In spite of war-time difficulties the British India office announced that arrangements had been made to transport Moslem pilgrims from India to perform the Haj in Arabia.

Oct. 18: **Canada.**—Mr. Mackenzie King announced the government's decision to give the Wartime Prices Trade Board authority for price control of all commodities except goods for export, and of rent and services. To control wages and regulate industrial relations a national labour relations board would be set up.

Oct. 21: **United Kingdom.**—An increase in the government grant for free school meals was announced.

Oct. 23: **South Africa.**—General Hertzog's advocacy of National Socialism ended a political association of more than 40 years with Mr. Havenga, leader of the Afrikaner party, who insisted on maintaining the democratic basis of the party.

Oct. 28: **India.**—A boycott of the new session of the central legislature was begun by the Moslem League party.

Oct. 29: **United Kingdom.**—Sir Earle Page, Australia's special representative, arrived in London.

Australia.—A budget superseding that of Sept. 25 during Mr. Fadden's administration was introduced by the treasurer and showed total expenditure as £324,965,000 (compared with £319,306,000 estimated in the previous budget), of which £221,485,000 represented war appropriation. Income tax on incomes over £2,500 was raised to 16*s.* 8*d.* in the pound.

Nov. 1: **United Kingdom.**—The historic estate of Wallington in the Middle Marches of Northumberland, comprising over 13,000 acres of farms and moorlands, was given to the National Trust by Sir Charles Trevelyan.

Nov. 2: **Hong Kong.**—The government protested to the Japanese government against a violation of the border on Oct. 29 when Japanese soldiers fired on Chinese inside Hong Kong territory.

Nov. 3: **United Kingdom.**—U Saw, premier of Burma, who arrived in England on Oct. 10 on a mission from his country, expressed dissatisfaction with the results of his visit.

Australia.—Sir Earle Page, the government's special representative to Britain, stated in London that Australia was fully capable of defending itself and taking part in the wider strategy that would be involved by war in the Pacific.

Nov. 6: **United Kingdom.**—Sir Walter Monckton was appointed head of the propaganda and information services in the middle east under the minister of state (Mr. Oliver Lyttelton).

Canada.—The minister of munitions announced an expansion of the shipbuilding programme, and new facilities for ship repairing were estimated to cost $4,500,000.

Nov. 11: **The Empire.**—Following observances of Remembrance Sunday on Nov. 9, when in England Flanders poppies covered the Empire field of remembrance outside Westminster Abbey, Armistice day was commemorated throughout the Empire. In Australia the anniversary was marked by the opening of the national war memorial by Lord Gowrie.

United Kingdom.—Eight people were shot, three fatally, in a remarkable shooting affair in west London for which a man was later arrested.

Nov. 12: **Canada.**—Senator Arthur Meighen accepted the leadership of the Conservative party.

Nov. 13: **United Kingdom.**—First details were released of the Avro-Manchester twin-engine bomber, disclosing a defensive armament of eight machine guns.

India.—Mr. Gandhi stated that so far as he knew the Congress party would neither appreciate nor respond to any gesture the government might make in releasing the Satyagraha prisoners. Invitations would be extended to those discharged to offer themselves again for civil disobedience if physically fit.

Nov. 17: **United Kingdom.**—Temporary increases were made in the domestic fat and sugar ration.

Nov. 18: **United Kingdom.**—A token stoppage of work by Clydeside shipyard workers in opposition to their trade union executive was organized to draw attention to demands for a 10*s.* a week wages advance.

Sir John Dill was created a field-marshal and appointed governor-designate of Bombay.

Nov. 21: **India.**—Mr. Thomas M. Wilson, first U.S. commissioner to India, presented his credentials to the viceroy.

Nov. 23: **United Kingdom.**—Under the new milk distribution scheme adult consumers were entitled to receive not more than two pints of fresh milk weekly.

Nov. 27: **Australia.**—The findings of Mr. Justice Halse-Rogers, reporting as royal commissioner investigating the use of "secret funds," were published.

Nov. 29: **United Kingdom.**—In the second year of the war savings campaign which ended on Nov. 21 £633,262,731 was contributed in small savings, compared with £484,043,375 in the previous year.

Dec. 1: **United Kingdom.**—Canned meats, fish and beans were rationed under a points system.

Malaya.—A state of emergency was declared throughout the Malay States and the Straits Settlements.

Dec. 3: **India.**—Civil disobedience prisoners released by the government included Maulana Abdul Kalam Azad and Jawaharlal Nehru.

Dec. 4: **United Kingdom.**—A parliamentary motion introduced by Mr. Churchill and embodying proposals for further mobilization of man- and woman-power "to achieve the maximum national effort" was passed in the Commons.

Dec. 5: **Australia.**—Army leave was cancelled and emergency measures in the Pacific were put into effect.

Dec. 7: **The War.**—Britain declared war on Finland, Hungary and Rumania, and similar declarations followed from the Empire.

Dec. 8: **The War.**—Britain declared war on Japan.

Dec. 11: **Australia.**—Emergency measures announced by Mr. Curtin included the call-up of single men of 35 to 45 and married men of 18 to 35.

India.—The arrest was announced of Sarat Chandra Bose, owing to his contacts with the Japanese.

Dec. 13: **New Zealand.**—Under new petrol restrictions no petrol was allowed for pleasure, and all motor deliveries and passenger services were reduced.

Dec. 16: **United Kingdom.**—The chancellor of the exchequer stated that recent expenditure had risen to nearly £83,000,000 a week. Total expenditure on the war had reached £8,300,000,000.

Australia.—New taxation, supplementing the October budget aimed at raising £16,000,000. It included a war-time levy on all incomes and an increase in company tax.

Dec. 18: **United Kingdom.**—The Duchess of Gloucester gave birth to a son, her first child.

Dec. 19: **United Kingdom.**—The King signed a proclamation making women from 20 to 30 liable to call-up under the National Service Act which became law on Dec. 18.

Straits Settlements.—Mr. Duff Cooper, already in Singapore, was appointed resident minister at Singapore for far eastern affairs.

Dec. 21: **United Kingdom.**—Peerages were conferred on four members of the Labour party.

Dec. 23: **United Kingdom.**—It was disclosed that Mr. Churchill was in the U.S. to discuss with the President full Allied co-ordination.

Dec. 25: **United Kingdom.**—The King's Christmas day message to his people was broadcast throughout the world.

Dec. 27: **The War.**—A state of war with Bulgaria as from Dec. 13 was announced in Britain.

Dec. 28: **Malaya.**—Registration began of all civilians in Singapore, and a Chinese council was formed to mobilize the resources of the Chinese communities.

Dec. 30: **Canada.**—Mr. Churchill addressed both houses of parliament.

India.—Mr. Gandhi resigned his leadership of the Congress party.

Malaya.—Martial law was proclaimed for the settlement of Singapore.

Dec. 31: **United Kingdom.**—Rembrandt's portrait of Margaretha Trip, from the collection of Lord Crawford and Balcarres, was bought for the nation at a cost of £20,000.

SUPPLEMENT

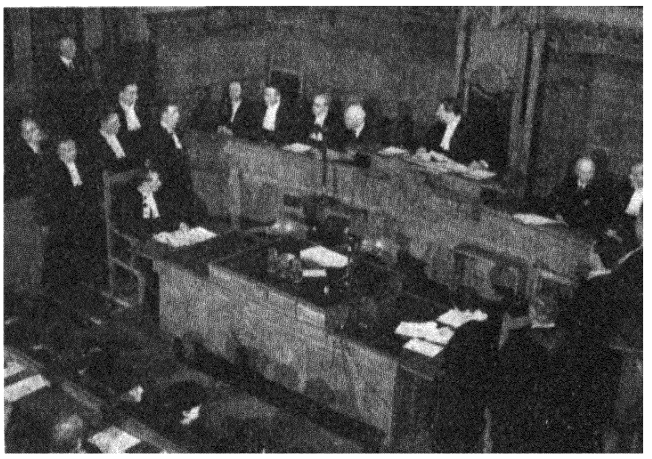
EMERGENCY LEGISLATION. The chief characteristics of emergency legislation during 1941 were, first, a steadily increasing demand by the state for personal services of members of the community and, secondly, greater stringency of provisions against economic waste and unfair distribution of commodities. Mobilization of citizens and national resources for the successful prosecution of the war is the key-note of both these aims. The first of them was evidenced not only by the extension of the ages of conscription for military service for both youths and adults but also in making compulsory the performance of certain civil duties connected with the war (e.g., fire-watching) and in requiring women between certain ages to register for national service. Proofs of the second aim appear both in Acts of Parliament and in a multitude of statutory rules and orders issued by government departments acting under statutory authority. A mere glance at the topics with which these orders deal shows the extent to which individual freedom of action has been subordinated to the needs of the war. Various restrictions were placed on dealings in specified commodities, e.g., confectionery, apples, lard, coal, petrol, bulbs, seeds, rabbits, and departmental legislation affected such diverse subjects as dock-labour, the load-line of ships and the permission to public vehicles to take a certain number of standing passengers. This article is necessarily limited to a brief notice of the more important statutes passed in 1941.

The *National Service Act* (4 & 5 Geo. VI, c. 16) extended conscription to the Civil Defence Services because it was found that, in some areas, the personnel of bodies like the Auxiliary Fire Service and the First Aid Associations would be insufficient to cope with enemy action. The Act by no means abandons the voluntary system here, but reinforces it by giving men, who are liable to be called up for military service, the opportunity of choosing service in civil defence, subject to vacancies being available and to the prior claims of the armed forces of the Crown. A person accepted in this way for civil defence becomes a servant of the Crown.

The intensification of enemy air attacks during 1940 and the earlier months of 1941 showed that, admirable as were the courage and skill of members of the fire-fighting service, there were serious defects in the organization of the system under which they worked. There was too much localization of it and the senior fire officers had not enough executive authority. The *Fire Services (Emergency Provisions) Act* (4 & 5 Geo. VI, c. 22) reformed this by enabling the Secretary of State to make regulations for the co-ordination of all or any of the fire services provided by local authorities, or for the unification in whole or in part of any of those services, and for any other matters which appear to him to be necessary or expedient for improving existing arrangements for fighting fires.

Probably no statute was of more general interest than the *War Damage Act* (4 & 5 Geo. VI, c. 12) which became law on March 26, 1941. Broadly, its purpose is to provide state-aided compensation for damage to certain kinds of property directly resulting from enemy action, from counter-measures against enemy action, or from precautionary measures against it. Naturally, injury due to air raids is the commonest form of such damage, but it is not the only instance. The Act applies to England, Wales, Scotland and Northern Ireland. Part I of it deals with damage to land and this includes buildings and other immovables. The proprietor of the land must pay a contribution which is in effect a new tax on land. There are special provisions relating to land that is mortgaged or leased. The period of risk covered by Part I was from September 3, 1939, to August 21, 1941, but a later Act extended it to August 31, 1942 (4 & 5 Geo. VI, c. 37). Part II of the Act relates to insurance of goods against war damage. The Board of Trade are to insure goods in the ownership or possession of persons carrying on business. Under the War Risks Insurance Act, 1939, they insure sellers or suppliers of goods in respect of their stocks. Part II of the Act of 1941 enables the board also to issue insurance policies on private goods, such as household furniture and other personal property owned or possessed by the insurer, or by members of his household ordinarily resident with him, or by his domestic servants. The Act is necessarily experimental. Some amendments of it have already been made by 4 & 5 Geo. VI, c. 37, and, like most emergency legislation, much of its working must depend on its adaptation to circumstances by statutory rules and orders made in pursuance of it. Nevertheless, both it and the Personal Injuries (Civilian) Scheme, 1940, which was noted in this article last year and which provides compensation for injuries sustained by civilians in consequence of the war, constitute a wise and courageous acceptance of responsibility by the state for alleviating the disasters that are incident to the civil population in modern warfare. Other and later statutes relating to the same topic are the *Repair of War Damage Act* (4 & 5 Geo. VI, c. 34) and the *Landlord and Tenant (War Damage) (Amendment) Act* (4 & 5 Geo. VI, c. 41). The former amended earlier legislation as to the powers of local authorities to repair buildings rendered unfit for housing purposes by war damage and as to state loans to these authorities for giving effect to their powers. The latter amended the principal Act passed in 1939, which dealt with the problems arising between the landlord and tenant of premises injured by war damage, and in particular enabled the tenant to disclaim the lease. The chief point in the amending Act is that it excepts from disclaimer short tenancies, which are defined in effect as those determinable on three months' notice; but it also frees the tenant from liability to pay rent if the premises are unoccupied and, if they are occupied, it allows him to apply to the court for adjustment of the rent payable, if he and the landlord cannot agree on the amount by which it shall be reduced.

Among the statutes concerning constitutional law, the following must be noticed. Since the time of Queen Anne it has been law that acceptance of an office or place of profit under the Crown shall disqualify the holder for a seat in the House of Commons. There were many exceptions to this rule (e.g. commissions in the armed forces of the Crown) and several more had been added since the outbreak of war. But its exigencies demanded freer and prompter action in increasing the exceptions and this was created by the *House of Commons Disqualification (Temporary Provisions) Act* (4 & 5 Geo. VI, c. 8). It enabled the First Lord of the Treasury (i.e., the Prime Minister) to certify that the appointment of any member of parliament to any office under the Crown is required in the public interest for purposes connected with the prosecution of the war. Such certificate must be laid before the House of Commons and the disqualification of office then does not apply to the member's tenure of his seat. The Act was not passed without a good deal of criticism in the House itself, on the



British Council]

FOREIGN LAW COURTS IN LONDON. THE NETHERLANDS MARITIME HIGH COURT IN SESSION AT THE MIDDLESEX GUILDHALL

ground that it seriously invaded the principle of the independence of the legislature from the executive, and a committee of the House appointed to consider the whole question issued its report at the end of 1941. Two other statutes originated in problems raised by the migration of members of allied governments to England in consequence of the war. Diplomatic privileges were conferred on them by the *Diplomatic Privileges (Extension) Act* (4 & 5 Geo. VI, c. 7). Much more remarkable is the *Allied Powers (Maritime Courts) Act* (4 & 5 Geo. VI, c. 21), which made a new departure by enabling His Majesty by Order in Council to permit any allied power to set up maritime courts with criminal jurisdiction in the United Kingdom. The jurisdiction is limited to offences committed by persons (other than British subjects) on board a merchant ship of the power concerned, or by the master or any member of the crew against the merchant shipping law of the power, or by any person, who is a national and a seaman of the power, against its mercantile marine conscription law. Provisions are made for the co-operation of the British executive authorities in bringing such persons to trial by the maritime courts and in compelling the attendance of witnesses. Norwegian, Dutch and Polish courts have already been set up under this Act. Another constitutional innovation was the *Isle of Man (Detention) Act* (4 & 5 Geo. VI, c. 16) which enables the government to detain in the Isle of Man non-enemy aliens and persons in confinement under the Defence Regulations. The Act was necessary, because technically the Isle of Man is not part of the United Kingdom and, apart from the statute, it would be unlawful to transport there British subjects or non-enemy aliens.

The Prices of Goods Act, 1939, provided safeguards against the " vicious spiral " of inflated prices and depreciation in the value of money by fixing basic prices for such goods as the Board of Trade should from time to time specify. The Act was not altogether effective and was amended by the *Goods and Services (Price Control) Act*, 1941 (4 & 5 Geo. VI, c. 31), which was designed to put a stop to " black markets " in commodities in common demand. Any person commits a criminal offence if he holds up the sale of stocks of goods which are subject to price-control. Holding up includes not only refusal to sell the goods but also false statements to a prospective buyer that the trader has not the goods. It extends also to offers to sell the goods subject to a condition that the buyer shall purchase other goods (whether price-controlled or not); indeed, no condition is permissible except that the buyer shall pay the price forthwith or that he shall take delivery within a reasonable time. The Act also empowers the Board of Trade to fix maximum charges for services to goods; " service " here signifies hiring goods or subjecting them to any process. Further, the board is enabled to regulate the sale of any class of second-hand goods in which it has reason to think that profiteering is taking place.

A considerable number of people have been plunged in financial difficulties by the war. Earlier emergency statutes had given them some relief, but the *Liabilities (War-time Adjustment) Act* (4 & 5 Geo. VI, c. 24) goes so far beyond prior legislation that it has been styled the " debtor's charter." " Debtor " under the Act includes, as well as individuals, partnership firms and private companies, but not other corporations. The Act does what none of the earlier statutes attempted to do; it enables a debtor to get, not simply temporary relief, but a settlement of his affairs with the prospect of continuing or renewing his business in better times; and he can achieve this without the disgrace of bankruptcy, although much of the procedure resembles bankruptcy procedure. The settlement is effected by a newly created body of officials called " liabilities adjustment officers."

The *Finance Act* (4 & 5 Geo. VI, c. 30) continued the principle of its predecessors with respect to taxation during the war, which is to restrain the expenditure of money on things the supply of which is not equal to demand. The most conspicuous feature of the Act was its increase of income tax from 8*s.* 6*d.* to 10*s.* in pound (*see* INCOME TAX; WAR FINANCE).

AUTHORITIES.—Primary sources are the Statutes and Statutory Rules and Orders published by the government; but these are not easily accessible as a whole to most readers. The best collection is *Butterworths Emergency Legislation Service Annotated*. It deals separately with (1) Statutes; (2) Regulations and Service, and both are kept up to date by the issue of supplements. (P. H. W.)

Dominions and India. Legislation has been passed in the dominions complementary to that enacted at Westminster since the declaration of war.

Canada.—The first act of the Canadian parliament in 1940 was an amendment of the National Defence Act of the war of 1914–18 which was repealed towards the end of the session by another Act (c. 21) authorizing the appointment of a minister of national defence with such additional ministers for the army, navy and air force as might be found necessary. A more comprehensive measure (c. 13) conferred upon the governor in council special emergency powers to permit the mobilization of all the effective resources of the nation, both human and material, for the purpose of the defence and security of the dominion. By orders and regulations made under the Act he may do anything " deemed necessary or expedient for securing the public safety, the defence of Canada, the maintenance of public order, or the efficient prosecution of the war." In order to carry out the provisions of this Act, the department for national war services was created (c. 22) with a separate minister entrusted with the duty to conduct a national registration of personal services and a survey of material contributions for the prosecution of the war and the welfare of the nation. In order to secure a united effort he was authorized to establish such provincial or local councils as might be necessary while enlisting and using to the full existing organizations able to assist in

carrying out the purposes of the Act. While looking to the provinces for co-operation in this respect the dominion at the same time took reciprocal action to mitigate the effects of war conditions in the provinces. Accordingly an Act (c. 23) was passed to provide for some contribution by the dominion, where circumstances warrant, to supplement the measures taken by the provinces towards providing assistance to those in need, establishing unemployed persons in employment, and training and fitting suitable persons for productive occupations, thereby lessening provincial and municipal burdens in so far as they might be due to extraordinary conditions of unemployment previously existing, and at the same time developing the economic capacity of the nation to carry on the war.

While willing to aid in furthering the national effort, the government made it clear that they had no intention of using this or any other legislation to relieve municipalities of their own obligations incurred to bondholders or of the sound administration of their own finances.

The growth of the Royal Canadian Air Force required new legislation (c. 15) to define the constitution and government. It carries the legislation of the United Kingdom relating to the air force into the dominion, subject to the usual provision that it is not inconsistent with anything contained in the Canadian Act.

Another piece of legislation of the Great War requiring extension was the War Measures Act (R.S.C., c. 27). Provisions relating to compensation for the valuing of certain property for war purposes are now contained in c. 28 of 1940 dealing with requisition of vessels or aircraft and space in ships.

The Act of 1939 creating a department of munition and supply was amended in the following year (c. 31) so as to extend the powers of the minister, including the creation of a body corporate by charter to undertake the actual supply of the munitions of war and the direction of any firms providing them.

The necessity for protection against the enemy within the gates found expression in the passing of the Treachery Act (c. 43) which expedited the procedure so as to avoid delay in dealing with accused persons and laid down measures for the transfer of offenders under the direction of the attorney general from the civil to the military authorities.

The division of powers between the dominion and provincial legislatures required legislation to be passed by the latter, as, for example, Acts in Alberta (1940, c. 4) and Saskatchewan (1940, c. 109) giving powers similar to those contained in the English Courts Emergency Powers Act, by which men on active service could be relieved from obligations, including exemption of their house property from assessment and taxation. The Saskatchewan Act provides an example of the extensions which have been found necessary to legislation of this kind. In the original Act relief was limited to estates assessed at an amount not exceeding $2,500. By an Act of 1941 (c. 87) relief up to that amount was extended to estates of any value.

The warmth of the hospitality of the dominions towards the scheme for sending children from Great Britain to their care found expression in legislation. Ontario, for example, assented on April 9, 1941, to the *British Child Guests Act* (c. 9) which made the superintendent of neglected and dependent children the guardian of any infant entering the province after Sept. 1, 1939, from Great Britain and Northern Ireland. He was given power to consent to a surgical operation, medical care and hospital treatment in any case where the consent of a parent or legal guardian is required and could direct that if necessary any child might be taken from the home where it resides and be placed in a foster home approved by a children's aid society. The Act does not apply to any child living with or subject to the control of either or both parents residing in Canada.

Parliamentary time has been much occupied with the measures necessary to deal with the financial requirements of the war. Details are beyond the scope of this survey, but broadly speaking it may be said that the main principles adopted in the United Kingdom were followed in the dominions.

Australia was particularly occupied with a number of financial measures during the session of 1940 which had a particularly large output of legislation. Similarly the states had to devote time to financial legislation though it was not wholly concerned with internal affairs. A *Tasmania Act* (No. 37 of 1940–41), for example, enables statutory bodies to contribute up to one per cent or £100, whichever is the greater, to any fund raised within the British dominions for the relief of victims of enemy air raids or any other patriotic purpose which the governor may approve.

In 1941 the first Commonwealth Act extended the long series of measures dating back to 1918, which deal with the provision of homes for men of the services. No. 2 required the employer to deduct the defence tax from the wages of the workman, and this by No. 3 was fixed at two and a half per cent. The Defence Acts were strengthened by No. 4 and the position of civil servants on active service protected by No. 5.

For the more efficient conduct of the war an Act (No. 24) increased the number of ministers of state in order to provide special ministerial responsibility for aircraft production, civil defence, including air-raid precautions, and the problem of the organization of civil resources. During the war of 1914 to 1918 the amount appropriated for the salaries of ministers of state was increased from £13,600 to £15,300, and this figure has now been raised from £18,000 to £21,250.

Indirectly as a result of war-time conditions, it was necessary to increase the endowment for children to five shillings for each child, payable to the mother for the "maintenance, training and advancement of the child." Another measure (No. 26) of a similar character constituted a commonwealth council for national fitness "to encourage the development of national fitness in each state under the direction of a national fitness council appointed by the government of the state . . . to promote physical education in schools, universities, and other institutions."

New Zealand was also engaged during 1940 in passing legislation to deal with finance, including a measure specially devoted to national savings which elsewhere have been authorized in the Finance Acts. The governor general was given (c. 1) similar powers to those exercised in Great Britain, Canada and Australia as required by the emergency to deal with compensation for property, treatment of aliens, etc. Faithful to its settled policy, New Zealand continued its endeavours to establish social security for the people, and by amendment (1941, No. 14) of the Social Security Act took a further step in the attempts to provide medical benefits. The funds have been supplied (1941, No. 4) to extend family allowances to mothers with one child instead of, as formerly, to those with three or more children. The government established (1941, No. 17)

a war damage commission operating on similar lines to the English arrangements. The *Rehabilitation Act* (1941, No. 25) covered the subject of post-war reconstruction by dealing with the re-establishment of " service men " (which includes men of the mercantile marine) in civil life, and industrial reconstruction, which is primarily concerned with the transfer to peace-time industries of persons who have been engaged in war work.

South Africa.—The legislation of South Africa shows participation in the empire conflict. The general provisions for the protection of the community are contained in the War Measures Act (1940, No. 13) dealing with the maintenance of public order and the prosecution of the war, and principally consist of the validation of proclamations already in operation. In the middle of 1940 an Act (No. 29) was passed to provide for the payment of benefits to men who had sustained injury and the dependents of those killed in action, for payments in certain circumstances to members of the Essential Services Protection Corps and others on their retirement and to the dependents on death, and for a moratorium for the protection of persons on military service. Special provision was made for clerks articled to attorneys that the period of active service might exempt them from part or the whole of their period of articles. The conditions under which absent military voters are entitled to record their votes were embodied in an Act of 1941 (No. 37). Provisions for pensions for men on active service dating back to the Boer War were extended by No. 45 of 1941. State insurance against war damage was authorized by c. 21.

South Africa also paid attention to the social security of its people, and passed a comprehensive measure for the control of factories and workshops (1941, No. 22) giving annual holidays with pay and increasing the maternity benefit for women in industry. A consolidation and extension of the law relating to workmen's compensation (No. 30) was another measure of the session. It established a state insurance fund similar to those in operation in Canada and Queensland where conditions are more comparable to those of South Africa.

India.—After providing for the registration of British subjects (No. 1) at the beginning of 1940, the Indian legislature proceeded to impose restrictions on foreigners (No. 2) by making provision for their entry, their internment, and their departure. Extension of service in the Royal Indian Navy for the duration of the war was authorized by Act No. 3 and provisions relating to national service by European British subjects whether in the armed forces or in a civil capacity were contained in No. 18, amended in 1941 (No. 6) by providing for the determination of the question whether a person is liable to be called up for national service. Minor amendments (Nos. 19 and 28) were made in 1940 in previous defence measures. Companies were authorized by No. 37 to make donations to public funds formed, and to make investments in government loans floated for the purpose of assisting the prosecution of the war.

The constitution of an air-raid precaution service was authorized by No. 4 of 1941, and rendered any persons failing to obey lawful orders liable to a fine not exceeding fifty rupees. Compensation for injuries during the present hostilities was authorized by the War Injuries Ordinance (No. vii), and included the purchase or grant of cost of artificial limbs or appliances.

AUTHORITIES.—Primary sources are the Acts and Ordinances passed by the various legislatures and issued by the government printers. Particulars above are also taken from a summary supplied by the law draftsman, J. Christie, for the annual survey of legislation of the empire published by the Society of Comparative Legislation. Useful information about legislative measures in their passage through parliament is obtainable in the *Journal of the Parliaments of the Empire* published by the Empire Parliamentary Association. (C. E. A. B.)

FOOD SUPPLY AND NUTRITION PROBLEMS.

The claim has been frequently made in official quarters that Great Britain was the best fed nation among the belligerents in Europe and was the only nation which had been able to increase its rations in the third year of the war. While this may be true it is undoubted that the diet of the nation did not reach a standard which dietitians demand. It is likely that there was still a grave deficiency in calcium, iron and possibly of vitamins of class B. The consumption of vitamin C had probably declined.

Rationing during 1941 was in much the position that it was in 1940. Bread was unrationed but its price was controlled. The government-rationed foods were meat, butter, margarine, cooking fats, cheese, sugar, jam, tea and eggs. Milk was rationed more by supply and price than by government action. Fruits, which were almost entirely home grown, were rationed by scarcity and their price was controlled. Vegetables were fairly plentiful though their price was often above that of peace time. Canned meats were controlled by a points rationing scheme. While the government, quite rightly, attempted to safeguard the diet of pregnant and nursing mothers and their children up to the age of five, no precautions had been taken to feed adolescents or young working women adequately. The diet of the child on leaving school and entering trade often depreciated because at school there was an opportunity—unfortunately lessening owing to shortage of obtaining cheap milk. Out in the world the adolescent needs more and better food than he gets while at school and the probability is that he was getting less and worse. Significantly among women between the ages of 20 and 30 the tuberculosis rate had increased and, generally speaking, the decline of tuberculosis—a feature of health statistics for many years—had been arrested. These facts are doubtless in part due to inadequate nutrition.

Judging by health statistics the feeding of the nation must have been satisfactory, if not optimal, and the ministries of food, health and agriculture could congratulate themselves on that achievement. It is clear from reports from the ministry of health that there existed a widespread fear of epidemic diseases comparable to the waves of influenza which swept the globe in 1918 and 1919, but these, up to the first months of 1942, had fortunately been absent. One explanation may well be that the large part of the population which had entered the army and war work was fed better than ever before; that mothers and young children of the working classes had had cheap or free milk and that unemployment had decreased from a figure of over a million to one measured by one or two hundred thousand. Those who were rationed by poverty in the past and not by government were finding themselves able to purchase food up to their rations.

Bread. The situation as regards bread was much where it was in 1940. The average dietitian pressed on the government the advantage of a wheatmeal bread fortified by calcium. Many would have liked to see such a bread made compulsory. There were other reasons, not dietetic, for the change over. Shipping space would have been

saved, for example, and although such a change might have resulted in a decrease of milk, pork and eggs (for the offal of wheat goes to feed cows, pigs and hens) there would have been a gain on balance of iron and vitamins of class B in diet.

In this situation the government havered. It promised a white loaf fortified with synthetic vitamin B_1, but although it was said that this should be introduced in May 1941, only a few districts—e.g., South Wales—had been provided with such fortified bread by the end of 1941. A promise was given that early in 1942 areas in the north-west would be included. Whether obstacles to the plan lay in the milling and baking industries or the manufacture of synthetic vitamin B_1, or elsewhere, is not known.

As regards a wheatmeal loaf the government itself widely advertised an 85 per cent extraction flour and bread made from it. But despite the advertisement only 7 per cent of the bread consumption was represented by this wheatmeal bread, which resulted in a negligible gain in shipping space and but little gain in dietetics. The reason given was that the people do not take readily to brown bread. The ministry of food never hoped for a conversion of more than 25 per cent of the white bread eaters to brown bread. (The army was expected to consume half and half.) The game seems hardly worth the candle. There could be little doubt that the temper of the country was such that if it could have been shown that a consumption of nothing but 85 per cent extracted wheat was a military necessity such a loaf would willingly have been accepted. That it is dietetically desirable had made no impression, due to the lack of education of the people in dietetics.

There is one dietetic disadvantage in a change from white to wheatmeal bread; that is the fact, now definitely demonstrated, though the work was still unpublished in early 1942, that such a change would lower the calcium uptake from our diet. That uptake is often dangerously low and would be made lower still. The phytates in wheatmeal flour militate against calcium absorption. They sterilize not only the small amount of calcium of the wheatmeal but in addition some of that of the rest of the diet. To counteract this action the committees of nutrition of the Lister Institute and the Medical Research Institute recommended the addition of 14 oz. of calcium carbonate to a sack of wheatmeal flour, and to safeguard the calcium uptake of the eaters of white bread an addition of 7 oz. to the sack of white flour. No steps appeared to have been taken to implement these sound suggestions. What difficulty stood in the way was not known. It could not be due to the public and it was suggested that it was due to the opposition of the milling industry. Even in the production of unfortified wheatmeal, looseness in the drafting of a statutory order was such that a mixture of white flour and bran met the ministry of food's demand for an 85 per cent extraction flour. Supplementary but not compulsory instructions which would have resulted in an 85 per cent extraction were obeyed by smaller firms but disregarded by some of the larger firms. The future will almost certainly lie with a bread enriched by addition of vitamins of the B class, iron and calcium.

Onions. Some other experiments of the ministry of food may be mentioned. In 1940 the onion crop was good but owing to the loss of imports from foreign countries was equivalent to only a small percentage of the national consumption. Consequently the price of onions threatened to soar. The ministry of food stepped in and fixed

Keystone

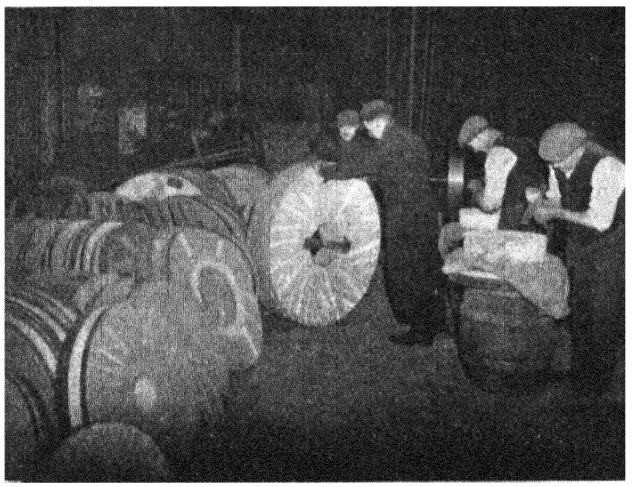
WHEATFIELDS ON THE SUSSEX DOWNS. THIS LAND WAS FORMERLY DERELICT AND HAD REVERTED TO GORSE, BRAMBLES AND ROUGH GRASS

a price and promptly onions disappeared off the market. The price of spring onions was not controlled. In the spring of 1941 onions in their second youth were offered as spring onions and the ministry stepped in again with a definition of a spring onion. Another consequence of the price-control of onions was the rise in the price of leeks, which touched 10*d.* each in the open market.

The ministries of food and agriculture proposed not to be caught again and made arrangements for a great increase in the acreage laid down to grow onions, and people were asked to register for the purchase of onions. Many when they discovered that they would get only 2 lb. *in the year*, refused to register, with the result that it appeared as if each registered person might get 12 lb.—an amount not to be despised. But the English climate stepped in. The onion crop was poor and the bulbs formed were often of the bottle-neck variety which do not keep. The hopes of the registered person fell to 2 lb. again and it became doubtful whether he would get one.

Vitamin C Supplies. When oranges disappeared, owing to shipping shortage, the infant welfare clinics had no obvious source of vitamin C for the babies. Swede juice, made by mincing, gently cooking and squeezing the pulp through muslin, would have done, but the clinics preferred black currant purée. In 1941 the government commandeered the black currant crop and fruit canneries in the black currant season made black currant pulp on government instructions and sent it to a central assembly place, where it was pooled, standardized and made into juice or into purée according to the age of the baby for whom it was intended. Again the vagaries of the English climate intervened. The vitamin C figure of the 1941 crop of black currants was the lowest known and created the greatest difficulty in producing an article with a reasonable content.

Rose hips, the richest common source of vitamin C, were also collected and syrup made from them was to be placed on sale early in 1942. It is interesting to note that the



The Times]

A WEST OF ENGLAND FACTORY WHERE MILLSTONES, SUCH AS ARE USED FOR THE GRINDING OF WHEATMEAL, ARE MADE. MILLSTONES ARE EXPORTED TO MANY PARTS OF THE EMPIRE

further north the greater was the amount of vitamin C in the hips. Presumably it is due to some varietal reason—it can hardly be a dispensation of providence—and this needs investigation. The Russians have long known and used rose hips in countering scurvy and have made, through their means and others, the colonization of the Arctic Circle a possibility.

Conclusions. On the whole the rationing system had worked well. The attempts of the ministry to safeguard the physical welfare of the young and their mothers were laudable and efficacious, and while their incursions into the control and sale of eggs and onions were less fortunate, their handling of the food situation was good and well-meaning if timid, especially, it has been suggested, in its relations with vested interests. If there is one thing which is certain it is that the feeding of a country, either in peace or war, can never be satisfactory till the agricultural policy of the country is subordinate to the demands of the ministry of food and these, in turn, subordinated to those of the ministry of health.

MAN POWER, CONTROL AND USE OF. Control of man power in war-time arises from a number of reasons. First and most important is the scarcity of labour and the need for economizing its use. Under normal conditions the market system effectively solves this problem, attracting labour to those jobs and localities where it is most needed. In war-time such a solution raises further problems. Particularly under a "cost plus" system of contracting, wages tend to rise sharply and labour turnover tends to be great, with consequent loss of time and inefficient planning of production. Moreover, the fact that men are conscripted into the services makes doubtful the equity of such a system. Secondly, therefore, control is a deterrent of inflation. Thirdly, production in war-time often demands a greater mobility of labour between industries, occupations and localities than can be obtained in the short run without control. Munition industries must be vigorously expanded and labour attracted from very dissimilar types of work, factories must be situated with regard to strategic considerations and transport and power facilities, and labour drafted to the new sites; while some localized industries must be expanded and labour brought from other districts. To achieve these changes with the speed requisite to the planning of campaigns and production, control is needed. Finally, this war has presented difficult problems of organization—the expeditious clearing of ships from ports, the clearing of air-raid damage and the like—and the mobilization of labour for tasks of this kind has suggested the need for direct control.

These are the basic reasons, each of which presents many aspects, why control in the economy has had to be extended to the control of the labour (and consequently of the lives) of men and women.

Methods. Various methods of control have been used. The oldest is the reservation from the armed forces of men above certain ages, according to their occupations. Men in occupations of especial importance to the national effort, e.g., engineers of various categories, would be reserved at early ages, whereas men whose labour was judged less necessary and the supply of which could safely be curtailed would be reserved only at a greater age—the younger men of those occupations would be available for military service. This was, of course, a device to maintain in employment certain types of workers considered to be of greater value in the production of warlike stores, exports or essential goods for the home market than they would be in the armed forces. Such men might be allowed to volunteer for the services, e.g., as tradesmen, for whom modern war makes great demands. This flexible system allowed continuous changes in the ages of reservation as more men could be taken into the armed forces and as experience or events showed there was, e.g., labour surplus to requirements in certain groups. It has, however, proved difficult to rectify mistakes in the other direction: men who have joined the services are not easily recalled into civilian life.

A weakness in the method of reservation by occupations was that, though it avoided the British failure of the war of 1914–18 to retain in industry men needed on the "home front," it did not ensure that there should be reserved from the services only those men actually engaged on essential production. And by reserving men who, despite their occupational qualifications, were not so engaged it both wasted man power and encouraged men to do other than vital work. This is not to suggest that the method of reservation by occupation was a mistake; it was probably the most efficient way of making a provisional distinction between those who could and those who could not be spared from industry to the services. But as the man power position became more stringent it became desirable to look more closely into the actual work being done by reserved men.

Reservation by occupation and age-group was by February 1942 in process of being changed to individual reservation according to the importance of the work being done by the individual. The change was being brought about by the simple expedient of raising by one year every month the age of reservation in the different occupations. Each month, therefore, a number of men become dereserved and the importance of the work they are doing is considered. It is upon an assessment of the importance of the work and of the scarcity of their skill that a decision is made as to whether these men are allowed to continue in their employment (as, of course, most will be allowed to do), whether they are transferred to other and more vital work, or whether they can be released from industry to serve in the forces. Each month, therefore, from January 1942

the work of a section of the men of the community was to be considered in relation to the needs of the country for men for the armed forces, for munitions and instruments of war, for civilian supplies and services, and to the supply of women to take the places of men in industry.

The ministry of labour and national service has power to register for national service men between 18 and 51 years and to direct them to leave their employment and if necessary their locality to do essential work, and the registration of men for national service or the dereservation of men provides opportunities for such direction. However, local labour supply committees report upon shortages and surpluses of different classes of workers, and men have been moved on the basis of such intelligence. The ministry of labour and national service is empowered to direct women to register under the Registration for Employment Order, and women so registering may be directed to take up work of national importance. It was the intention to register women up to the age of 40 years by the spring of 1942. In general, unmarried women between 20 and 30 years may be directed into one of the women's branches of the services, although on registering they are invited to express a preference between the services and industry. These women are pre-eminently the so-called mobile women who will, if necessary, be directed to take up work of national importance away from their homes, though women over 30 without domestic ties may also, in the event, be called upon to leave their homes. It is the announced intention of the ministry of labour and national service to use the services of married women and mothers to the greatest possible extent by finding work for them near their homes, by arranging where possible part-time work and by organizing the care of children.

Extension of Principle of Conscription. In this way, the principle of conscription has been extended from military service for men to include the conscription of women into the armed forces, and finally to cover the direction of men and women to work according to the requirements and the interests of the state. And a further extension of the interests of the state into the activities of citizens is marked by the registration of young persons of both sexes, who will not be required but will be persuaded to undertake in their leisure hours activities which will be of immediate help to the nation, e.g., enrolment in the Home Guard, or which will fit them for better service in the course of time, as for example by joining the Boy Scout or Girl Guide movements.

A better utilization of labour is achieved by the requirement of the ministry of labour and national service for many men and women who have registered for national service or for employment to be engaged for employment only through labour exchanges. In this way, the movement of labour can be guided into the required channels and an influx of labour prevented either into industries which it is national policy to contract or into localities where, for any reason, an increase in the population is not desired.

These are the important methods of control, though there is other action by the state which may be allowed to fall within this term. In the ports, for example, schemes have been worked out and adopted whereby a pool of labour is formed which can be directed to where it is most urgently needed for the loading or unloading of vessels. Agreements have been achieved between the state and trade unions whereby trade union rules and customs are held in abeyance during war-time to allow, e.g., dilution and the employment of women on what previously were men's jobs. Strikes, without notice of intention, have been declared illegal. These are methods of control in that, whether or not by agreement, they alter the normal methods of work or the peace-time contours of the labour market.

GIRLS CALLED UP FOR NATIONAL SERVICE REGISTERING AT THEIR LOCAL EXCHANGE

Problems Associated with Control. There are a number of difficult problems inseparable from the controls adopted which have had, of necessity, an effect on the ways these controls have been used. Most troublesome, perhaps, of all have been those connected with the direction of labour entailing movement of people from their homes or working in places inconveniently situated in relation to their homes.

Moving workers from one locality to another encounters least reluctance when they are enabled to be accompanied by their families. But in war-time this is clearly very difficult. To find housing accommodation for the families of the many workers needed to man new factories has in many districts been made less easy by the residence of people evacuated from danger areas: to build accommodation would place an unbearable strain on man power. Hence recourse is necessary to the splitting of families and the billeting of workers. This in turn raises problems of feeding arrangements, which have been partly solved by the establishment of works canteens and British Restaurants. Clearly to use man power wisely and efficiently something more is needed than policy and decision. It is necessary to help workers to adjust themselves to new lives, and this must make demands upon the goodwill of the public towards transferred workers.

Transport presents another difficulty. Workers are moved to factories situated far from their homes and new factories are built in outlying districts. When railways are already under pressure from increased freight traffic, road services reduced by fuel rationing and impeded by black-out restrictions, the organization of travelling facilities for war workers to a degree that will maintain efficiency presents real problems. Here again co-operation by the general public is very desirable so that unnecessary travel may be avoided.

One should mention, too, the strain put upon family life. The discomforts that arise when all adult members of the family are working or when they are separated are real, but in large part unavoidable—though they can be eased

by provision of meals at the factory, the allowance of time for shopping and the provision of efficient transport. But the difficulties arising from a young family are less easily dismissed and unless met must necessarily reduce the woman power available for work. Up to the spring of 1942 little organized assistance had been extended to the mother, who had had largely to rely, if she could and would, on the good offices of neighbours or relatives, and few nursery schools had been established.

It is difficulties of all these kinds which hamper the use of the very complete powers the state now possesses for mobilizing the man and woman power of the country.

It is true that the use of Britain's labour resources has been made less efficient by the absence of any visible long-term programme matching the use of labour with the programmes of production and of the armed forces. The country was hampered by shortages of particular types of labour required for the development of production. And this could, to some extent, have been avoided had the requirements of labour been considered in detail when the future production of the different departments was decided upon. It could then have been discovered to what extent, if at all, these plans were incompatible with one another by virtue of their rivalry in the labour market, and to what extent assistance could be rendered to achieve these plans by taking steps to have adequate supplies of labour of the different skills and grades available at the dates at which they would be expected to be wanted. For, it must be remembered, it may be more difficult to train workers than to build factories or even to equip them.

The same necessity is evident for the planning of the location of factories. The same care is needed to obtain full information of the demands of different departments and of the labour supply available in a particular area. It is planning of this kind and resolution, at an early stage, to obviate rivalry between different departments and even between different contractors, that is necessary if obstacles to an extension of production are not to occur because of shortages in the labour supply. On the other hand, in so surprising a war, with so many changes in strategic needs arising from so many appearances and disappearances in the ranks of the countries fighting the Axis, efficient and consistent planning of the use of British labour would have been very difficult indeed. (J. S.)

POST-WAR RECONSTRUCTION. A Survey of Thought and Action in 1941. Reconstruction is a single word, but it covers a multitude of things. Looking back, at the end of January 1942, over the last year, one noted many plans suggested by planners, and a number of things done (or at any rate entered on the list of agenda, as things to be done) by statesmen. A brief record of both is attempted in this article.

(*a*) In the realm of recent thought, and among the many plans suggested by planners, there were four lines of approach which seemed to claim particular notice. The first may be called the line of American approach. Here Mr. C. K. Streit, who had already published before the war his book called *Union Now*, which led to the movement of Federal Union, added, in the course of 1941, a new book with the title of *Union Now with Britain*. It is a vigorous and moving plea for an immediate federal union—mainly on the basis of the American constitution, but with some modifications in the direction of the British cabinet system—between the United States, on the one side, and Great Britain and the five Dominions of Australia, Canada, Eire, New Zealand and the Union of South Africa, on the other. Such a federal union, proclaimed and inaugurated even during the course of hostilities, would in Mr. Streit's view help to end the war, to establish a permanent peace, and to ensure the security of the world. Professor Catlin, an Englishman who has held a chair of political science in an American university, added a pendant to Mr. Streit's *Union Now with Britain* in a book entitled *One Anglo-American Nation*. His book, too, is largely directed to the union of the United States with the British Commonwealth, in a common "Anglosaxony." But it has also a European side, and it looks to France and the northern States of Europe as well as to the Anglo-Saxon world; nor has its argument the swift immediacy which is a feature of Mr. Streit's plan. Professor Catlin is wedded to British ideas of gradual and progressive effort; and his scheme is a scheme not for a world at war, but rather for a post-war world.

A second line of approach may be called the line of the British Commonwealth. This was the line followed by Mr. Lionel Curtis in a brief but pregnant pamphlet published in the summer of 1941 under the title of *Decision*. Mr. Curtis—deeply versed in the conduct as well as the study of affairs for over thirty years past, and already concerned in the first beginnings of South African union in the first decade of this century—had already published, as long ago as 1916, a plea for imperial federation in a work called *The Problem of the Commonwealth*. He renews the plea, but he also extends its scope, in his *Decision* of 1941. He still argues in favour of turning the British Commonwealth into a federal State, with a federal parliament and cabinet competent for purposes of foreign policy, defence, and the measures of finance required for foreign policy and defence, but with the parliament and cabinet of each member-State still retaining control of the social composition and the economic structure of its own community, and thus retaining the power to pass its own immigration laws and to impose its own tariffs. He now adds, however, a new extension to the scope of his plan. He puts to himself the question, "What of countries like Belgium, Holland, Denmark and Norway?" He answers, "Let us offer them the chance of joining the union on the same terms that Britain and the Dominions have already established between themselves." He puts to himself the further point, that "we cannot ignore our responsibilities after this war to our allies, Czechoslovakia, Poland, Yugoslavia and Greece"; and he meets the point by suggesting that if the democracies of western Europe unite with those of the British Commonwealth, the union could be opened, on exactly the same footing, to our eastern allies. On Mr. Curtis's scheme, therefore, a federated British Commonwealth becomes a European magnet, and draws into its company, on terms of equality with Great Britain and the British Dominions, European States both in the east and the west. Indeed he goes further still. He suggests that when Germany had acquired a government responsible to Germans at large, the time would be ripe for her inclusion. He even dreams that the miracle which Mr. C. K. Streit has suggested—the union of the United States with the British Commonwealth—would be less unlikely to happen if the people of the United States could be presented with a federated British Commonwealth which they could join without surrendering (as in the scheme of *Decision* no member-State would be required to surrender) their control of their own immigration laws and their own tariffs.

Scheme for a Federated Europe. A third line of approach

may be called the European. Unlike the first two (which both, if in different ways, depend on the basic idea of Anglo-Saxon community, irrespective of continents), this line of approach depends on the basic idea of the community of the continent to which we belong. One of the representatives of this line of approach is Sir George Young, in his book called *Federalism and Freedom*. A European diplomatist, versed in European affairs, Sir George is perhaps in the line of descent from Aristide Briand and his conception of a United States of Europe. He advocates a federation of Europe in which no member-State, *unless it is itself federal*, may have a population of more than 10,000,000. It follows on his plan that all States with a population greater than that amount—France, Great Britain, Germany, Poland and the rest—must decompose themselves first into federations in order to join, along with the other and smaller States, the Union of Free Federated Europe, which would thus be a federation itself consisting, in large part, of federations. The model for this Union of Free Federated Europe is to be found in the constitution of Switzerland. Thus Europe will be set *fare da se* and to achieve its own salvation (with an economic constitution on the Portuguese model added to a political constitution based on the Swiss); and the United States, and perhaps the British Dominions, free from the problem of Europe, will cultivate their own gardens.

This is perhaps an airy scheme; but it brings into relief a fundamental difficulty of British policy which inevitably confronts all makers of plans—the difficulty that Great Britain is trilateral, touching on one side the United States, on another the British Dominions, and on another the continent of Europe. Any feasible plan must be accommodated to this fundamental fact, which is also a fundamental difficulty. A sober regard for this fact and this difficulty is particularly shown in two broadsheets issued by the organization called Political and Economic Planning, in the latter half of 1941. The first (No. 172), which goes by the name of "The Future of Germany," suggests that the post-war settlement of Europe should be along the lines of the British Commonwealth rather than of a written constitution—in other words that, instead of the British Commonwealth being first federated and then used as a magnet to attract western and eastern Europe (as Mr. Curtis suggests), it should remain unfederated, as it stands, and should serve as a *model* for some union of Europe or some system of a number of regional unions in Europe. Not only is the British Commonwealth to serve as a model for Europe, according to the argument of this pamphlet: Britain must also take an initiative and incur responsibility in Europe, "in the long-term interests of the European majority and in the convergent interests of the U.S.A. and the Dominions." The second pamphlet (No. 182), which is called "Britain and Europe," carries these ideas into further detail. Assuming that European unity involves the leadership of some great power, and that Britain is faced by the duty of acting as that power, it seeks to suggest the basic principles of a European commonwealth which Britain might take the lead in establishing. On the political side the argument is once more advanced that the approach should be empirical, and based on the experience of the British Commonwealth as it stands: on the social and economic side a number of suggestions are offered (particularly in the matter of the training of a service for European reconstruction) which deserve the most careful study. The general pattern which emerges is that of a new Europe aided and for the time being led by Britain, with a European conference at its centre on the model of the imperial conference, and with that conference regularly attended by all foreign ministers, served by a strong permanent secretariat, and regularly meeting in London for the discussion of European affairs. This is but a jejune sketch of the gist of these two pamphlets, which every reader is advised to read and ponder for himself. They show a sobriety and responsibility of judgment which should win them the closest attention.

(*b*) **Active Developments.** In the realm of action, and of things done or placed on the list of agenda by statesmen, there is less to note on the subject of reconstruction, but the record, even though brief, is pregnant with importance for the future. In the first half of the year 1940 it was the development of British relations with France (tending, as it then seemed, to a closer and closer union) which appeared to be of cardinal importance. The climax of this development—which also proved, for the moment, to be its end—was the offer of Anglo-French union made by the British Prime Minister on June 16, 1940. What negotiations had preceded the scheme, and how far it had been sought on the French side as well as offered on the British, we do not yet know. What we do know is that the scheme now hangs, as it were, in a vacant interstellar space, rejected by France in her hour of ruin, and left silently on the record by Britain. What we may guess, and what many of us cannot but deeply believe, is that in any scheme for the reconstruction of Europe a new and reconstructed France must be drawn into close alliance and active co-operation. A new Europe will need the light and leading which we may hope that a new France, true again to her old traditions, will wish and be able to give.

Meanwhile, in the course of 1941, the development of statesmanship turned in other directions. It turned, in the first place, in the direction of the United States, and towards closer and closer co-operation between Britain and the United States. The result was seen in the Atlantic Charter, as it came to be called, of August 1941. Perhaps the greatest and most cardinal fact of this charter was not its substance, but its signatories; not the noun "Charter," but the adjective "Atlantic." In a word, the fact of a joint declaration by the President of the United States and the British Prime Minister was the supreme fact. The actual substance of the charter was inevitably of a very general character; but some of the provisions (though even they must obviously be clarified and specified further) were more concrete. Among these were the provision for enjoyment by all States of access on equal terms to the trade and raw materials of the world needed for their economic prosperity, and the provision for economic collaboration between all nations for securing improved labour standards, economic advancement and social security. The charter generally, since its issue in the August of 1941, has received a new measure of adhesion and a new wealth of signatures both from the Allied governments in Great Britain and from the twenty-six governments who endorsed it at Washington on Jan. 1, 1942.

"Europe in Britain." Another direction in which statesmanship turned was that of the formation of something in the nature of a common council of the governments of the British Empire and the Allied governments now resident on British soil. Interallied War Conferences began to be held at St. James's Palace on June 12, 1941; a second followed on Sept. 24, at which the Atlantic Charter was accepted; and in these meetings may already be seen something of a system of consultation and co-

Keystone]

THE ALLIED AND IMPERIAL CONFERENCE AT ST. JAMES'S PALACE, LONDON, IN JUNE 1941. ON THE KING'S LEFT IS GENERAL SIKORSKI AND ON HIS RIGHT THE DUTCH PRIME MINISTER. MR. CHURCHILL IS AT THE LEFT OF THE PICTURE

operation between the British Commonwealth on the one side and the States of western and eastern Europe on the other. Whether or no the British Commonwealth becomes a model, or even a magnet, for Europe, and whether or no it assumes a responsibility for leadership in Europe, it is already engaged in a close connexion with Europe. This is a natural result of the residence on British soil of a number of European governments (the Norwegian, the Dutch, and the Belgian: the Polish, the Czechoslovak, the Yugoslav, and the Greek), and of the fact that no small part of Europe is now, in a sense, domiciled, so far as its governments are concerned, in Britain. This present situation of " Europe in Britain " is the natural germ for a future policy of " Britain in Europe," on the lines sketched in the planning broadsheets already mentioned. The Interallied War Conferences are already a European organ, which may assume a permanent character, in a new and amplified form, as new developments provide the stimulus. In this connexion the proceedings of the second conference, of Sept. 24, were especially important. Not only did the members of the conference (including the representatives of the Soviet Union) express their adherence to the common principles of the Atlantic Charter, and their intention to co-operate in giving them effect. They also adopted a resolution in favour of building up a common supply of food and raw materials for the post-war needs of European countries after their liberation, and for the establishment of a joint bureau for this purpose, reporting to a committee of Allied representatives. Here is a germ, which may well grow, of European co-operation in the work of reconstruction.

A third and last direction in which statesmanship turned was that of the preparation of what may be called regional federations, or unions, between contiguous European States. Having fallen because they were divided, States have resolved to stand united. As long ago as November 1940 Poland and Czechoslovakia drew together for this purpose, and in January of the present year (1942) the governments of both countries agreed on a number of essential points with regard to their future confederation —a confederation which they desire should embrace other States with which their interests are vitally linked. The governments of Greece and Yugoslavia were also drawn together, and initiated, almost simultaneously, a movement towards Balkan union, which was warmly welcomed by the Polish and Czechoslovak governments as a collaborator in assisting the security and developing the prosperity of the region between the Baltic and the Aegean seas. The regional reconstruction of Europe is thus already begun.

This survey has been confined to post-war reconstruction in the broader sense in which it affects Europe at large. Some few words may be added in conclusion on reconstruction as it affects Great Britain and so far as it was being planned by the government in 1941. (Nothing can be said in regard to the numerous voluntary societies and groups which were also engaged in planning.) From January 1941, the minister without portfolio, Mr. Greenwood, as chairman of a group of ministers, and pending the formation of a separate ministry for this purpose towards the end of the war, was responsible for considering the practical problems of transition from war to peace and for outlining a policy, for the immediate post-war years, likely to command national support. Lord Reith, the minister of works and buildings, acting within the framework of Mr. Greenwood's general study, and assisted by a small group of ministers, was responsible for considering the general problems of town and country planning, immediately in the areas damaged by the war, but ultimately on a general scheme. He appointed committees (such as the Uthwatt committee for the examination of the problem of sites in bombed areas, and the Scott committee for the consideration of building and constructional development in rural areas): he instituted a consultative panel of advisers on physical planning; and he had before him the report of the Barlow commission (issued in January 1940) on the distribution of the industrial population. (E. B.)

PRICES, INCOMES AND STANDARDS OF LIVING. From the outbreak of the war to the end of 1941, wholesale prices in Great Britain rose by about 60 per cent, retail prices by about 30 per cent and wage rates by about 20 per cent. Behind these statements of facts, there are hidden vast government schemes of restriction and control of materials of all kinds, rationing, control and price-fixing of goods sold retail, and wage-fixing and wage advances and increases in the hours of labour, and increases in output and the national income.

Wholesale Prices. The increase in wholesale prices was not at the same rate during the 2 years and 4 months since the outbreak of the war, nor was it distributed equally throughout the various items, price records of which are included in the construction of price indices. The summary table at the top of the following page, gives some detail which will illustrate the history of prices from 1939 to 1941.

With the change over from a peace economy to a war economy, and the complete dislocation of foreign trade and shipping, costs of importing goods naturally increased —in addition, there were inevitable increases in rates of insurance on ships and cargoes—consequently there was a greater increase in wholesale prices of food and tobacco compared with those of materials at the immediate outbreak of the war. On the average, in the first four months of the war, Sept.–Dec. 1939, the wholesale price index rose by 16·3 per cent, the increase in the food and tobacco group being 22·1 per cent and that in the materials group being 13·4 per cent. Where imports bulk largely in British economy, e.g., cereals and cotton, the percentage increases were greatest, 35·9 per cent and 32·0 per cent respectively. On the other hand, the increase for coal was only 5·7 per cent.

On the average, for the year 1940, prices rose, compared

with Aug. 1939, by 39·3 per cent. The largest increases were for cereals (64·3 per cent), cotton (54·0 per cent) and wool (53·4 per cent), and the smallest was that for coal (19·3 per cent).

BOARD OF TRADE WHOLESALE PRICE INDEX (1930 = 100)

Group	Index Numbers					Percentage Increase from Aug. 1939			
	Aug. 1939	Sept.–Dec. 1939	Year 1940	Year 1941	Dec. 1941	Sept.–Dec. 1939	Year 1940	Year 1941	Dec. 1941
Cereals	84·0	114·1	138·0	150·4	168·0	35·9	64·3	79·0	100·0
Meat, Fish and Eggs	84·3	98·9	114·6	118·1	116·0	17·3	35·9	40·1	38·8
Other Food and Tobacco	100·1	116·8	143·3	166·5	167·5	16·7	43·1	66·1	67·2
All Food and Tobacco	90·4	110·4	132·7	146·1	150·5	22·1	47·3	61·7	66·6
Coal	117·4	124·1	140·1	159·5	162·8	5·7	19·3	35·8	38·6
Iron and Steel	128·6	135·1	159·2	181·1	181·7	5·1	23·8	40·8	41·3
Non-Ferrous Metals	100·7	107·0	123·2	123·9	124·1	6·3	22·4	23·0	23·2
Cotton	81·4	107·4	125·3	138·2	142·4	32·0	54·0	69·9	75·0
Wool	102·6	120·3	157·3	170·1	171·9	17·2	53·4	65·8	67·5
Other Textiles	74·1	92·3	108·5	120·2	126·5	24·6	46·5	62·3	70·6
Chemicals and Oils	93·0	99·9	117·1	126·9	129·7	7·4	25·9	36·5	39·5
Miscellaneous	96·1	115·9	142·6	169·1	172·6	19·5	48·4	76·0	79·6
All Industrial Materials, etc.	102·2	115·9	138·4	155·8	158·4	13·4	35·4	52·5	55·0
All items	98·1	114·1	136·6	152·6	155·9	16·3	39·3	55·5	59·0
Basic Materials	94·5	117·7	147·3	166·7	170·5	24·6	56·0	76·5	80·5
Intermediate Products	104·0	118·9	145·0	165·1	167·7	14·3	38·4	58·8	61·3
Manufactured Articles	108·7	116·8	133·7	148·4	150·3	7·4	23·0	36·5	38·3

In the next year the rise in prices generally was slowed down. The average for the year 1941 was 55·5 per cent above Aug. 1939, i.e. only 11·7 per cent above the general level of the year 1940.

The change in the tempo of increasing prices may be indicated by reference to comparisons of Aug. 1939 with Aug. 1940 and Aug. 1941. In the first 12 months of the war the general level of prices rose by 43 per cent (16·3 per cent was the average increase in the first 4 months, Sept.–Dec. 1939), in the next 12 months (Aug. 1940 to Aug. 1941), the general level of prices increased by 9 per cent. In the next four months, from Aug. 1941 to Dec. 1941, the increase was 1·8 per cent. Thus the gradual monthly change declined.

During 1941, many prices were for practical purposes stabilized, the relevant indices hardly changing at all.

The following table shows the individual changes in the year 1941.

BOARD OF TRADE WHOLESALE PRICE INDEX

Relative Changes (*Dec.* 1940 = 100; *Increase* +, *Decrease* −)										
Cereals	Meat, Fish and Eggs	Other Food and Tobacco	Coal	Iron and Steel	Non-Ferrous Metals	Cotton	Wool	Other Textiles	Chemicals and Oils	Miscellaneous
+ 14	− 4	+ 3	+ 7	+ 1	+ 1	+ 11	+ 3	+ 15	+ 6	+ 7

The level of prices of the meat, fish and egg group actually declined during the 12 months. The largest increases continued to be in the cereals and textile groups.

The Times]

COMMUNAL MEALS—IN ONE OF THE BRITISH RESTAURANTS INSTALLED IN PLYMOUTH FOR FEEDING THE WORKERS WHOSE HOMES ARE OUTSIDE THE CITY

With war-time control and stabilization of some prices, and with restrictions on freedom of enterprise, and with lack of competition amongst traders, the meaning and purpose of wholesale price indices change. The Board of Trade figures do enable us to keep in a concise form records of changes which occur during war conditions, but some doubt must exist as to the exact comparability of the series of indices which is now being computed with that computed before the war. There are probably difficulties in obtaining quotations of prices of certain goods which are exactly comparable with those used before the war started.

It is interesting to make a comparison between the changes which took place in the first two years of the present war with those which occurred in the first two years of the war of 1914–18. According to the *Statist* index of wholesale prices, the change was an increase of 61 per cent from Aug. 1939 to Aug. 1941, the indices being 90·4 and 145·1 respectively. According to the *Economist* index of wholesale prices, the increase was 51 per cent, the respective indices being 70·3 and 106·4. From July 1914 to July 1916, the *Statist* index showed an increase of 58 per cent and the *Economist* an increase of 62 per cent. Approximately, the same change took place in the first two years of the present war as occurred between 1914 and 1916, an increase of some 50 to 60 per cent.

Retail Prices. For the first two years of the war of 1914–18, the Ministry of Labour's cost of living index shows a rise of some 45 to 50 per cent, while for the same period the food index rose by 61 per cent. These are obtained by comparing July 1916 with July 1914. For the present period, the same official index indicates a rise in the cost of living from Aug. 1939 to Aug. 1941 of 28 per cent, the food figure being 22 per cent. There is a striking difference between the recent course of these retail indices compared with the experience of 25 years ago, and that of the wholesale indices. In the present war, government management, by rationing, control and subsidies, regulated the increase in the cost of living to barely half of that which took place in the less restricted conditions of the first two years of the last war.

In the first month of the present war the official cost of living index rose 10 points from 155 at Sept. 1, 1939, to 165 at Oct. 1, 1939, an increase of 6½ per cent. During 1940 the index rose from 174 at Jan. 1 to 196 at Jan. 1, 1941, an increase of 12½ per cent. During the year 1941, the index changed very little, from 196 to 200, an increase

of 2 per cent. The slowing down of the increase in wholesale prices previously noted was thus accompanied by a similar slowing down of the increase in the cost of living index. Of the constituent items of the cost of living index the most important is food. With price regulations, the increase in the price of food during the war period was not great, apart from that which took place on the outbreak of the war. During 1940, on the average, food prices rose by 9½ per cent. During 1941, food prices actually declined on the average by about 4 per cent. For the most part, during this period, prices were stable. The chief cause of the decline was the lowering of the price of fish and eggs.

The next most important item in the cost of living index is rent. This index has been practically unchanged since the war. It was 162 in Aug. and Sept. 1939 and rose to 164 in May 1940 and remained at the same figure subsequently. The greatest changes were those for the clothing index. This was 205–210 at the outbreak of the war; it rose to 290 at Aug. 1940, to 380 at Aug. 1941 and to 395–400 at Dec. 1941. This index increased by about 90 per cent. The fuel and light figure was 180 at Aug. 1939, 182½ at Sept. 1939, 212 at Aug. 1940, 228 at Aug. 1941 and 230 at Dec. 1941. There was an increase of about 28 per cent in this item. A similar change was recorded in the miscellaneous part of the cost of living index.

Since the beginning of the war, meat prices increased by about 20 per cent, bread and flour prices hardly changed, sugar and milk prices increased by about 30 per cent, butter prices rose by about 20 per cent, the price of margarine by about 12 per cent and that of cheese by 30 per cent. The price of fish had increased by 100 per cent at the middle of 1941, but at the end of the year the increase was 42 per cent. During the year, the increase in the price of potatoes varied between 30 and 50 per cent.

The original purpose of the cost of living index number, to measure the change in the cost of maintaining a hypothetical family on a certain standard of living, was necessarily defeated with the introduction of rationing, particularly of foodstuffs and clothing. Even before the war some doubt had been expressed regarding the appositeness of a cost of living index based primarily on budgets which had reference originally to the year 1904. The Ministry of Labour had, in fact, undertaken to investigate working-class budgets on a grand scale in 1937–38, and by the beginning of 1942 would probably have introduced a new index based on this more recent experience. With the onset of the war, much of this work was inevitably postponed, but some important results of their inquiries were published in the *Labour Gazette* of Dec. 1940. These related to some 8,900 industrial households, the original choice of households having been a random one.

The official cost of living index only pretended to have regard to basic expenditure, a comparatively small number of foodstuffs being included. Jams, cocoa, coffee, fruit and vegetables (apart from potatoes) were excluded. Only a few items were included under the heading of miscellaneous: soap, ironmongery, newspapers, tobacco, fares, etc. When the relative expenditures on the various items which were included in the original computations of the cost of living index are obtained from the results of the new 1937–38 inquiry, and these new figures are used for weighting purposes in the construction of a cost of living index, the final result is not very much different from the official figure. Naturally, changes occur if more importance is attached to the miscellaneous group, i.e., if entertainment, magazines, furniture, more insurances, and so on are included as a basic part of living, and if the list of foods is extended to include fruit, preserves, etc. In effect, we should be constructing a new index number based on the 1937–38 experience of the standard of living.

We can compare the average expenditure obtained from the 1937–38 inquiry with that of present day rationing. On the average, an industrial household of 3·77 persons spent 4*s.* 8½*d.* on meat, about 17·8*d.* per person. For the greater part of 1941, the meat ration was 1*s.* 2*d.* per person, which, allowing for the rise of about 20 per cent in price since the war, corresponds to 11·7*d.* on the basis of pre-war prices. Thus, effectively, on the average, instead of 17·8*d.* being spent on meat, the amount is 11·7*d.*, a reduction of about 35 per cent. On the average, in 1937–38, the industrial household bought 22·4 oz. of bacon; the present ration for 3·77 persons is 15 oz., a reduction of 33 per cent. Again, in 1937–38, the industrial household purchased 48 oz. of butter, margarine and lard. For the greater part of 1941, a household of 3·77 persons could purchase only 30 oz., a reduction of 37 per cent. Moreover, whereas the proportion in 1937–38 of butter to margarine and lard was 3 to 2, in the present rationing scheme the proportion is 1 to 3. As for sugar, the average industrial household purchased 4·8 lb. in 1937–38, and the ration during the greater part of 1941 for 3·77 persons was 1·9 lb., a reduction of 60 per cent. The ration of fats was increased by 2 oz. per person on Nov. 17, 1941, and that for sugar was increased by 4 oz. on the same date, and in addition there was an extra 8 oz. for four weeks in the summer of 1941.

Apart from bread and flour, there was, for each person, a considerable reduction in the consumption of basic foodstuffs. As a result of this reduction, consumers endeavoured to supplement their purchases by buying alternatives. These gradually were brought under control, and rationing was instituted in order to ensure a fair distribution. Fish prices soared, compared with other prices.

Clothing coupons helped to ensure a reasonable distribution of necessities to all, and at the same time the purchase tax helped to discourage the buying of luxuries. We have previously referred to the great increase in the prices of clothing since the outbreak of the war. It is practically impossible to measure the reduced purchases of clothing due to the coupon scheme and the increase of prices, but there is no doubt of this reduction for the civilian population. Also, there had been a reduction of travelling facilities. Prices of entertainment were higher in 1941 than in 1938–39. The general standard of living, which included all such amenities at the service of the community, had been reduced in certain respects. On the other hand, the public social services, health, education, etc., existed in 1941 at the same level of excellence as before the war.

Standards of Living and Incomes. It is difficult to assess the extent by which standards of living had changed since the war. A vast number of people called up for war service had had their lives completely changed, so that for them a direct comparison is impossible. A part of the civilian population had undertaken part-time service of one kind or another, and had thus substituted one method of spending leisure for another. Travelling was restricted and there was probably more book reading, and certainly more smoking. Freedom of choice of ways of spending money was curtailed, and there was always present the urge to buy war savings certificates. There is one crude qualitative method of estimation—that of health. According to reports of the Ministry of Health, the nation's health had not deteriorated since the outbreak of the war.

In the early part of 1941, a report referred to the large number of cases of cerebro-spinal fever in the previous year, but the death rate from this cause was considerably less than it had been formerly.

Since the outbreak of the war, advances in wage rates had been made to the extent of about £5,000,000 per week. This represents an increase of about 20 per cent in wage rates. From information obtained by the Ministry of Labour (*Labour Gazette*, Dec. 1941), it is estimated that the increase in *earnings* at July 1941 over October 1938 was 42 per cent. This was due to longer hours being worked, increase in rates of wages, extension of the system of payment by results, and changes in the constitution of the labour force as to age, sex and occupation. It is pertinent to note that, whereas in Aug. 1939 there were about 1¼ million unemployed, at the end of 1941 there were only about a quarter of a million unemployed, according to the Ministry of Labour's unemployment statistics. Thus, to compensate for an increase in cost of living of 28 per cent, the official figure (or more, if we pay regard to the fact that to make up for diminished supplies of foods which have not risen greatly in price, workers have to buy other foods, such as fish, potatoes and green vegetables, which have increased more in price), there was an average increase of earnings of 42 per cent.

Official estimates of national income and expenditure published in " An Analysis of the Sources of War Finance and an Estimate of the National Income and Expenditure in 1938 and 1940 " (Cmd. 6261, 1941) enable one to get a picture of changes since the war in the distribution of the national income between private and government expenditure. The following figures are drawn from this report.

	1938	1941 (estimated from fourth quarter of 1940)	Percentages, allowing for an increase of 20 per cent in prices	
			1938	1941
	Amounts in £million			
National Income	4,415	5,804	100	109½
Personal Expenditure	3,400	3,652	77	69
Government Expenditure	840	3,892	19	73½
Investment (+) or Disinvestment (−)	+ 175	− 1,740	4	− 33

In 1938, the total national income was divided up between personal expenditure, government expenditure and investment in the proportions 77 : 19 : 4. It is estimated that the total national effort had increased by 1941 by about 9½ per cent. But personal expenditure had declined from 77 out of 100 to 69 out of 109½; thus although the total output had increased, personal expenditure had declined. On account of the war government expenditure had increased to 73½ out of 109½; this being achieved partly by the increase in real output, partly by the decline in private consumption, and partly by disinvestment or drafts on capital. These figures show briefly the effects of the various schemes of price control, rationing and restriction. In 1938, before the war, the private individual consumed 77 per cent of his output. It is estimated that, during the year 1941, based on figures for the last quarter of 1940, the private individual consumed 69 units out of an increased output of 109½, or 63 per cent of his output. In a sense, the change from 77 to 69 gives a quantitative indication of the decline in the standard of living due to the war. The decline, in fact, is greater than this, because, under ordinary circumstances, an increasing output brings a higher standard of living. (E. C. Rh.)

PUBLIC HEALTH IN WAR-TIME. After more than two years of war it was possible to review in retrospect its effect on the health of the people, with reasonably good evidence for guidance. The usual annual returns of the registrar-general for England and Wales and of the ministry of health were not available, but information could be obtained from the weekly and quarterly returns, the latter of which had been augmented in important respects, and the results of certain special inquiries had been published. An analysis made in the *British Medical Journal* shows that the number of deaths in large towns fell from 303,271 in 1940 to 262,467 in 1941, but the relevance of these figures may have been vitiated by movements of the population. The infant mortality rate in these towns rose from 61 to 71 per 1,000 live births. The United Kingdom came through heavy enemy attacks from the air during the winter of 1940–41 without serious impairment of the general health of the population, although, of course, these attacks were reflected in a substantial increase in the deaths due to violence, especially in large towns. There is no evidence that regular resort at night to air-raid shelters had any deleterious effect by itself, but it probably contributed to the fatigue of workers which may have influenced the increase of tuberculosis. Some occurrences of a kind which are usually associated with war, and some which were unexpected, deserve special mention.

Acute Infectious Disease. The following table, also extracted from the *British Medical Journal*, shows the trend of infectious disease since 1937 as indicated by notifications.

	1941	1940	1939	1938	1937
Scarlet fever	57,982	65,573	78,201	99,413	95,859
Whooping-cough	169,863	53,403	—	—	—
Diphtheria	50,056	46,683	47,910	65,720	61,870
Measles	405,580	407,908	—	—	—
Pneumonia	49,547	47,712	42,275	45,117	55,816
Cerebro-spinal fever	10,986	12,791	1,506	1,293	1,157
Dysentery	6,485	2,843	1,963	4,210	4,066
Enteric fever (paratyphoid and typhoid)	4,687	2,824	1,524	1,347	2,157

Measles and whooping-cough were not generally notifiable before 1940, and the significance of their prevalence cannot be judged from such short-term statistics, because of the large periodical fluctuations which normally occur. In large towns the fatality rate of measles rose from 0·26 per cent to 0·34 per cent, and of whooping-cough from 1·3 per cent to 1·6 per cent, but the notifications which form the basis of these rates are probably too imperfect to justify the attachment of much significance to them. It is possible, however, that the disturbance of normal life by air raids in the latter part of 1940 and the first six months of 1941 may have reduced the chance of recovery of young children contracting these infections.

Mention has previously been made of the low incidence of most of the common infections of childhood after the outbreak of war, in spite of the expected effect of evacuation of children from dangerous areas.[1] New facts have come to light which indicate that this conclusion from general observations requires to be modified. Stocks has made a careful analysis of the areal distribution of scarlet fever and diphtheria and shown that, while the incidence of these diseases in proportion to the child population as altered

[1] *Encycl. Brit. Book of the Year*, 1940, Supplement, 25.

IMMUNIZATION AGAINST DIPHTHERIA IN PROGRESS AT A SCHOOL CLINIC

by evacuation fell in evacuation areas in comparison with neutral areas in the first six months or longer after war broke out, a substantial increase occurred in receiving areas. The mixing of infected immune children with susceptibles in protected areas seems therefore to have had the influence which had been apprehended before evacuation took place. These diseases, however, never reached serious epidemic proportions and the effect passed off fairly soon.

Cerebro-spinal Fever. The high incidence of this disease continued in 1941. Although notifications fell by nearly 2,000 as compared with 1940, the figure far exceeds anything recorded in other previous years. Cerebro-spinal fever seems to be repeating the behaviour it followed in the war of 1914–18, and a high but falling prevalence is to be expected so long as hostilities last. Accurate records of its power to kill are not yet available, but it is evident that the use of the sulphonamide group of drugs has very greatly reduced the case-mortality rate at all ages.

Diphtheria. The increase in the amount of diphtheria after two years of falling incidence is disappointing in the light of the great efforts made by local authorities to immunize children in their areas. It is probably correct to say, however, that very few populous places in Great Britain have yet attained that proportion of immune children (about 50 per cent) which has been found necessary in other countries before any significant effect on the volume of the disease can be expected. Like other infectious diseases diphtheria has its periodical ebb and flow, and it may be that there would have been still more of it but for immunization. Investigations in Liverpool by Prof. H. D. Wright demonstrate that variations occur from year to year in the proportion of cases due to different strains of C. diphtheriae [1] and it may be that a more invasive type is now assuming dominance.

[1] *J. Path. and Bact.*, 1941, 52, 283.

Respiratory Diseases. From the table of notifications it is evident that there has been some increase in pneumonia, but not to the extent usual in years when influenza occurs in epidemic form. In fact the latter disease, which caused such devastation in 1918, was not highly prevalent in 1940 and 1941. There was a great increase in deaths from respiratory causes, however, in 1940 as compared with 1939, which gave rise to a suspicion that the stress of air raids and shelter life might be causing the spread of respiratory infection. Close examination of the figures reveals that the increase was due mainly to bronchitis in elderly people, that it occurred chiefly in the first quarter of the year, before air raids began, and that it coincided with exceptionally bitter weather. A rather heavy mortality both from pneumonia and bronchitis in the first and second quarters of 1941 (not comparable in magnitude with that of the first quarter of 1940) may have been partly due to the influence of war-time conditions.

Alimentary Infections. One of the most disturbing features of war-time has been the upward tendency of enteric fever and dysentery, as shown in the table. The decline of these diseases had been one of the brightest passages in the long history of the public health movement. They were already on the up-grade in 1940, and the increase in 1941 was great. It was not due to air-raid damage of water or sewage installations; although damage of this kind was common, associated epidemics did not occur. Fortunately the increase is little reflected in mortality, since it was due, in the case of enteric fever, to the milder paratyphoid form, and to a large extent to the type of dysentery caused by B. dysenteriae (Sonne) which gave rise to a previous epidemic in the winter of 1937–38. There is no clear explanation of these occurrences, but several of the paratyphoid fever outbreaks were due to the consumption of pastries containing synthetic whipped cream. As paratyphoid is rarely spread by water, a definitely authenticated small outbreak so caused is of considerable interest.[1] Outbreaks of a mild form of diarrhoea affecting both adults and children were also common, but up to early 1942 bacteriologists had failed to trace the causative organism and inclined to the view that it might be some hitherto unrecognized virus.

Trichiniasis (trichinosis). Until recently this disease was regarded as extremely rare in Great Britain, and such routine post mortem examinations for evidence of past infection as have been made confirmed this impression. An account of eight small outbreaks, however, occurring since 1922 in South Wales has recently been given by Nancy Howell.[2] Further, during the winter of 1940–41 epidemics involving approximately the following numbers of cases occurred in England, viz., Wolverhampton 130, Hertfordshire 5, Birmingham 78, Cumberland 50–100. Investigation indicated that occasional cases may have been occurring in Wolverhampton for a number of years, perhaps as the result of the custom of eating raw sausage meat, to which the 1941 unprecedented epidemic was attributed. Efforts to trace the pigs from which the infested flesh responsible for any of these outbreaks was derived were unsuccessful, and extensive examination of pig carcases confirmed the view that the disease is rare in home-bred swine. This makes it unlikely that infection is carried on by garbage-feeding of pigs—the mode of transmission from animal to animal now accepted as common in the U.S.A.—and suggests that the rat may be

[1] *Emerg. Pub. Hlth. Lab. Serv., Mon. Bull.*, Feb., 1942, 1.
[2] *Pub. Hlth.*, 1941, 55, 5.

still regarded as the important vector for pig-infection in the United Kingdom.

Typhus Fever. The Spanish civil war aroused anxiety as to the introduction of typhus into western Europe by troops from Morocco, where the disease was prevalent at that time, but it was not till later that reports indicated its presence in considerable volume in Spain. Since the opening of the campaign in eastern Europe in the spring of 1941 well-authenticated accounts have been obtained of the spread of typhus westward from that area, and cases have certainly occurred in Germany. In view of the danger of its introduction into Britain by persons returning from an infected area the ministry of health issued a memorandum to public health officers [1] advising them as to the precautions which ought to be taken. These include the organization of diagnostic and preventive teams, the provision of hospital accommodation and arrangements for the reduction of louse infestation in the community. The Harvard field hospital unit of the American Red Cross placed a mobile team at the disposal of the ministry and local authorities.

Pediculosis. In connexion with the problem just mentioned it has become apparent from observation of evacuated children that louse infestation is commoner than was thought, and the inquiries of Kenneth Mellanby [2] have expressed its extent in precise terms. For instance, he found that 50 per cent of town girls at ages from two to twelve years had lice or nits in their hair. While typhus is generally thought to be carried only by the body-louse, which is much less common, it is thought possible that the head-louse may also act as a vector. The measures proposed for the eradication of lice may conveniently be mentioned in connexion with the cognate problem of scabies.

Scabies. For a few years before the war school medical records showed that itch was definitely increasing. It has become a serious problem during the war both among soldiers and civilians. Mellanby extended his investigations to this disease and found a sharp rise in war-time, reaching as many as 40 cases per thousand admitted to one hospital for other reasons during the first six months of 1941.[3] The minister of health therefore made the Scabies Order, 1941, which applies also to pediculosis. It enables the medical officer of health to require cleansing and treatment of verminous persons and articles, to inspect contacts and to seek out cases of infestation. In particular, health departments are now able to follow up to their homes school-children found to be verminous and to treat and disinfest the family and premises.

Tuberculosis. The registrar-general's quarterly returns disclose the rise in mortality from tuberculosis anticipated in the 1941 year book. Its decline, which had been continuous for many years and was seriously interrupted only by the war of 1914–18, was arrested in 1939 and reversed in 1940 and the first half of 1941. It seems likely that the history of the previous war will be repeated in this respect. The war-time increase is probably not due to the discharge of sanatorium patients at the outbreak of war, since such action was not taken in 1914–15 when a similar rise occurred, nor to shortage of food. It may be a consequence of overwork, long hours and irregular living, perhaps accentuated by the fatigue experienced by workers during the air raids of 1940–41. There is evidence of a general kind that a similar increase has occurred in other belligerent countries, and the state of affairs is said to be serious in the occupied low countries where it is probably intensified by privation.

Gastro-duodenal Disorder. Numerous articles in the medical press indicate that one of the greatest causes of unfitness among men recruited into the fighting services is disorder of the upper part of the alimentary canal, taking the form of gastric or duodenal ulcer in a large proportion of cases. Whether there is a real increase in such disorders as compared with former times, or merely more complete ascertainment, it is hard to say. It is at least certain that a large proportion of beds in military and emergency service hospitals have been occupied by such cases, and many men have had to be discharged for this reason. It seems unlikely that war-time dietary is responsible. Just as recruitment during the South African war revealed the presence of much physical defect in adolescence and led to the inception of the school medical service, the recent records of recruiting boards and the fighting services may point to new measures of preventive medicine directed at such chronic disability in the young adults of the present day. (R. M. F. P.)

SOCIAL WELFARE, MEASURES FOR PROMOTING. This war, like that of 1914–18, has turned a searchlight on the social life of the people of Great Britain. Like the last war too, it has shaken people and institutions out of all kinds of ruts. But its impact on individuals and families has been far closer. The billeting of industrial workers, teachers, staffs of evacuated business firms, service men and women and evacuated children and mothers has affected innumerable homes in reception and neutral areas. To be bombed out from office, shop or home has been the lot of many in towns. Change of occupation, of place and ways of living has been the experience of literally millions of men and women in industry and the forces.

To meet the social needs arising out of these war conditions new services of many kinds have come into being. Some have been developments of social experiments of pre-war days, some have been created to meet urgent and often unforeseen needs, others have come through the seizing of opportunities for new forms of social progress by far-sighted people.

Services' Welfare. Welfare services for serving men and women have been greatly extended in this war. Educational facilities have also been developed on new lines. The creation of an army welfare department at the war office, supported by county welfare officers and committees, was a new departure. So, too, was the formation of the council for voluntary war work to co-ordinate the work of the societies which had served the need of the forces in the war of 1914–18. Under their auspices over 5,000 canteens were set up, in addition to those run by local churches and independent bodies. These and the 3,800 institutes provided were only some of the ways in which the societies concerned were endeavouring to meet the social, educational, recreational and spiritual needs of the men and women in the new citizen armies.

Factory Welfare. In 1940 the factory department of the home office was transferred to the ministry of labour. This was followed by the setting up by the ministry of a factory welfare advisory board, charged with the promotion of the welfare of industrial workers. Eleven regional welfare officers were appointed—assisted now by close on 100 local welfare officers—concerned with matters affecting the welfare of workers outside the factory, including transport,

A CANTEEN FOR MINERS AT THE PITHEAD, GLASSHOUGHTON COLLIERY

billeting and recreational facilities. A central consultative committee together with specialized sub-committees was formed, composed of voluntary organizations with experience of various types of welfare service.

Housing of Workers.—Very soon the need for the housing of workers became urgent; billeting was not sufficient, nor possible in isolated districts where the new shadow factories were sometimes established. The ministry of supply accordingly built hostels mainly for women and girl workers at the royal ordnance factories. These were specially constructed buildings with accommodation for 100–1,600 workers who sleep in houses surrounding a dining and recreation building with community centre facilities. The ministry built and equipped the hostels, which were staffed and managed respectively by the Y.W.C.A. and Y.M.C.A. jointly, the Workers' Travel Association, the Holiday Fellowship and the Co-operative Holidays Association. In addition the ministry of supply provided houses on small housing estates for married key workers with families. These were managed by trained housing managers, usually directly from the ministry, though in one or two cases local housing associations acted as the ministry's agents.

The National Service Hostels Corporation provided hostels on behalf of the ministry of aircraft production and other factories. Agricultural workers' hostels, including those for members of the Land Army, were arranged for by the ministry of agriculture through local war agricultural committees and voluntary bodies.

Works canteens were another vital need—partly to help the family rations, partly for the benefit of workers where distances made it impossible to obtain the mid-day meal at home, or billet or hostel. Miners' canteens were a specially welcome institution.

Factory Concerts.—In factories during the lunch hour, concerts became a frequent occurrence, varying from the performance of a local concert party to the visit of artists belonging to the Entertainments National Services Association (E.N.S.A.), or a recital of chamber music by the staff of the Council for the Encouragement of Music and the Arts (C.E.M.A.). The former organization staffed by professional actors and actresses and other artists gave 52,000 concerts in factories apart from 156,000 performances to the forces through the help of the Navy, Army and Air Force Institutes (N.A.A.F.I.).

The Council for the Encouragement of Music and the Arts was the result of a venture by the Pilgrim Trust partnered later by the board of education (which afterwards assumed full responsibility) to provide opportunities in town and country, among the forces and in the workshops, for good music, the production of opera and plays, and the study of art. Some 8,000 concerts of all kinds, including concerts in shelters and rest centres, were given in 1940 and 1941, 1,500,000 people saw plays given by the fifteen companies touring the country. Just under 1,000,000 people saw the "Art for the People" exhibition, consisting of original paintings, reproductions and autographic prints. A further popular exhibition was that of "Living in Cities."

War-time Nurseries. With the entry of married women in increasing numbers into industry, the need for day nurseries for children under five became acute in certain areas. At the outbreak of war about 150 nursery schools and day nurseries, together with various residential nurseries in London and large towns, were evacuated to large country houses. Vacancies arising through children moving on to junior schools or for other reasons were filled by children who, through war conditions, had become social casualties. As conditions became graver owing to intensive bombing more such nurseries were opened. By Feb. 1, 1942, the number of residential nurseries had increased from the original 150 to 362, and the number of nursery places from 4,600 to 10,750. Of the 212 new nurseries, 114 had been provided by voluntary societies, substantially assisted by funds derived from the United States and the British commonwealth, and the remainder by local authorities, individual voluntary efforts and those carried on by the British Red Cross Society.

A new scheme for whole-time and part-time nurseries sponsored by the ministry of health and board of education and operated by local welfare authorities with the co-operation of local education authorities and voluntary organizations came into being. It was designed particularly to meet the needs of industrial workers. By the beginning of 1942 276 nurseries were open and over 600 in preparation. There was also a large extension of nursery classes in elementary schools.

An official scheme of minders or daily guardians was promoted by the ministry of labour to help where nurseries were not possible for lack of suitable premises or other causes. The ministry also gave grants in aid for the provision of play centres by the local education authorities for older school children whose parents were working long hours in industry and other forms of national service.

Social Centres. At the beginning of the war and again after the heavy bombing of the autumn of 1941, many mothers went to the reception areas with their young children. Housed very often in billets, they were at a loss how to spend their days without being an intolerable burden on their hostesses and themselves. So there grew up social centres or clubs in halls lent by churches and voluntary bodies or in empty houses. At the close of 1941 there were 443 social centres with occupational facilities and 287 without. While many of the mothers had returned to their homes in evacuation areas at the end of 1941, an official estimate of the mothers remaining in the country amounted to 145,000 apart from 100,000 scheduled as homeless or with special disabilities.

British Restaurants.—A particularly popular feature was the provision in some centres of communal meals such as were organized by the South Wales social service clubs for their London visitors. These were being transformed into "British Restaurants," where satisfying meals were avail-

able for all kinds of people. In towns of varying size these new forms of communal living were finding a place, intended for the public outside the scope of the big factory or communal canteens. British restaurants numbered 1,300 by early 1942. Some were run entirely by local authorities, though often with the help of voluntary workers. Others were run by voluntary bodies such as clubs or settlements.

Post-raid Welfare. The early rest centre leaders in London made experiments which influenced the development of the fine chain of rest centres available under the London county council. The appointment of a special commissioner for the homeless in the same area set on foot a remarkable scheme of re-housing and welfare in which local authorities, government officials, voluntary agencies and a team of experienced social workers co-operated.

Originally started as an aid to civil defence the Women's Voluntary Services by the end of 1941 had enrolled over 1,000,000 volunteers, who played an indispensable part in post-blitz work as auxiliaries of the local authorities. Another W.V.S. development was a vast clothing scheme in close association with government departments and local authorities for helping both homeless and evacuated families in need. In this, the timely aid of the U.S.A. and the Dominions and gifts from all parts of the world were of great value.

Citizens' Advice Bureaux. While war conditions were creating these various measures of social welfare, one service had been foreseen and prepared for since the crisis of 1938. The National Council of Social Service had then called into being a standing conference of voluntary organizations in time of war, whose first task had been the preparation of an information service to meet the numberless inquiries for which the anxious citizen would need an answer. The day war broke out a large number of citizens' advice bureaux were opened, those in London under the direction of the charity organization society, elsewhere through the help of local councils of social service, other voluntary agencies and public-spirited individuals Their main object was to provide for all citizens a centre of advice and information on all kinds of personal and domestic problems. Behind the bureaux grew up an intelligence service known as *Citizens' Advice Notes* which, from the information department of the National Council of Social Service, provided accurate information on legislative enactments and war-time services of every description. These *Citizens' Advice Notes* (later issued in book form with supplements as required) reached a circulation of 6,000. In addition to the workers of the 1,000 or more citizens' advice bureaux in towns over 600 people agreed to act as citizens' advisers in villages and isolated districts.

Old People's Welfare. Amongst the many problems dealt with by the citizens' advice bureaux few were less easy of solution than those of old people. Many of them were made homeless by enemy action, many were left stranded in London and the big cities when their sons and daughters were transferred to other districts for munition work or evacuated to the country. The administration of supplementary pensions to old age pensioners undertaken by the assistance board revealed the many needs of lonely old people. At the suggestion of the board the National Council of Social Service set up a committee to co-ordinate and extend work for the welfare of the aged. Old people's welfare committees were set up in the provinces and a register of homes for the aged was compiled.

Youth Work. With the introduction of the service of youth scheme in 1939 the board of education took a new share in the development of youth activities through the setting up of a national youth committee and the encouragement of local youth committees set up by local authorities. All the 146 higher education authorities in the country by 1941 had formed youth committees, many of them representative of voluntary bodies as well as educational interests. Policy showed two tendencies (1) to strengthen the work of existing youth organizations by grants in aid and (2) by the setting up of new youth centres where activities for the 14–20 age group were specially fostered. While the majority of schemes were set on foot through local youth committees, the board could assist individual clubs and usually did so on the recommendations of one of the established national youth organizations. Clubs of all kinds were accordingly developing—rural clubs, mixed clubs, old scholars' clubs, as well as the usual boys' and girls' clubs and the uniformed organizations. Mixed activities were more and more common both in these and in the new war workers' clubs for young adults, financed by the ministry of labour and organized by such bodies as the Y.W.C.A. and the National Association of Girls' Clubs, and other voluntary organizations.

At the younger end, war conditions and the desire to serve found expression in youth service squads which undertook numberless services from salvage collection to messenger work for the civil defence services. Later, existing pre-service training schemes were expanded through cadet corps. This was followed by a number of training schemes for girls which were co-ordinated through a national voluntary committee.

Other Welfare Services. It would be impossible to enumerate even briefly, in the scope of this article, the war-time developments in provision for the economic welfare of serving men and women and their dependants, for war orphans, for the aftercare and training of the disabled and for the appointment of almoners in all emergency hospitals for after-care work.

Other tendencies of social welfare in 1941 included the growth of regionalization typified by the appointments of regional welfare officers of the ministry of health, the earlier ones of regional officers of the National Council of Social Service and regional administrators of the W.V.S. There was, too, the increasing employment of social workers by government departments and local authorities. There was a growth of co-operation between the state and national and local voluntary bodies. This last showed a diverse pattern. It might include a ministry of supply hostel built and equipped by the ministry and staffed and run by voluntary bodies, a communal feeding scheme organized by voluntary institutions on behalf of the ministry of food, and the whole range of services covered by countless women's organizations and the W.V.S. (M. L. H.)

WAR FINANCE. The most outstanding fact in war finance in the third year of war was the large increase in national expenditures. This may be illustrated from the budgets of the countries concerned, or by expressing the expenditures as percentages of the net national income; when national expenditure is expressed as a percentage of the national income, it must be borne in mind that part of the expenditure is from capital or dissaving. In Great Britain, the percentage of expenditure (national and local) to national income in 1941–42 was about 67 per cent as compared with 59 per cent in 1940–41, and 31 per cent in 1938–39. Of this total expenditure, the share of war or

Keystone]
LONDON'S WAR WEAPONS WEEK IN MAY 1941. A MESSERSCHMITT 109 ON SHOW IN TRAFALGAR SQUARE

defence was 51 per cent, 42 per cent, and 9 per cent, respectively. In Germany, the figures were much higher ; it is not possible to calculate the percentages because expenditure figures were not available, but a statement was issued during the year for propaganda purposes to the effect that public expenditure, including municipal expenditure, in 1938 was 42 per cent, in 1939 53 per cent, and in 1940 70 per cent. In 1941, on this basis, the expenditure would be well over the 1940 figure. Expenditure, it may be noted, was increasing in the Reich at a much faster rate than revenue. In the United States, government expenditure (national, state and local) was 29 per cent in 1938–39, 28 per cent in 1940–41, and 46 per cent in 1941–42, and of this 2 per cent, 7 per cent, and 27 per cent, respectively was defence or war expenditure. These figures are striking because they show that as war proceeds, the national economy of the nations concerned is turned over, at the expense of the people, more and more, to the production of munitions. In peace time, governments are attempting to increase the standard of living of all. In war, the contrary is aimed at. The restriction of consumption is not the unfortunate by-product of war finance ; it is and must be the deliberate object of war finance. The expansion of the resources devoted to war is the same thing as the compression to the minimum of those resources retained for the consumption of the people. This transfer of resources was being achieved mainly by four methods : (1) taxation, (2) borrowing or the utilization of savings, (3) a combination of taxation and borrowing, and (4) inflation. Rationing may also be said to be a method by which consumption is reduced, making available for the use of the government what would otherwise have been devoted to consumption. In Germany, for example, with the exception of potatoes, amusements and books, practically everything was rationed. The result was that with full employment and considerable over-time and no means of spending, savings were swept into government coffers. The limitation of consumption is also possible by directly limiting the amount of goods produced for civilian use.

By inflation is meant an increase in the general price level as a result of an increase in the public's spending power, due to increased government expenditures, while goods available for purchase are not correspondingly increased in amount. While taxation and loans take money out of the pockets of the people before they can spend it, inflation permits them to spend as much as before but ensures they get much less for their money. Prices under inflation, whether money is printed by the government or borrowed from the central bank or other banks, and paid out by the government for wages or materials, rise as a result of the competition between the government and the general public for the purchase of goods and services required for the conduct of the war. The government with its unlimited resources ultimately outbids the consumer. It is obvious how unsatisfactory inflation is compared with taxation, by which every pound which the government spends is withdrawn from the public's income according to an agreed plan and not surreptitiously by the inflation of prices.

The belligerent countries have not all followed the same policy as regards the combination of taxation and borrowing. In Great Britain, the policy has been to tax to the utmost and to meet the remainder from loans. Some of this taxation was deliberately levied to stop consumption of goods in order to set free income for government purposes. Up to the beginning of 1942 this had not been successful ; the consumption of both alcohol and tobacco much exceeded the estimates in the 1941–42 budget, and the rate of release of sugar had also been increased ; the yield of the purchase tax was well above the budgeted figure.

The large extent of borrowings in the third year of the war is distinctive among all the belligerents—in some more than in others. In the last war, Germany financed her effort mainly by loans, in this war she is following the example of Great Britain and the United States by using taxation and borrowing. Secretary of State Reinhardt has announced that the national debt of the Reich had increased to Rm. 90,000 millions by March 1941. This was an increase of, roughly, Rm. 40,000 millions during the financial year 1940–41. In other words, the Reich had at its disposal in 1940–41 the sum of Rm. 76,000 millions from revenue, administrative fees, war contributions of local authorities, payment for occupation costs, and borrowed capital, which at the rate of Rm. 12 to the pound, works out at £6,300 millions. At the beginning of 1942 the Reich was spending much more than this figure. In Great Britain, an intensive drive for large and small savings was producing astounding results. In the second year of the war, ending November 1941, £633,262,731 were in the form of national small savings, as compared with £484,043,000 in the first year. Savings, both large and small, form the loan money which must increase with the intensive effort of the national savings campaign. During the financial year 1940–41, the national debt increased from £8,411,221,301 to £10,872,241,552—an increase of £2,461,020,651.

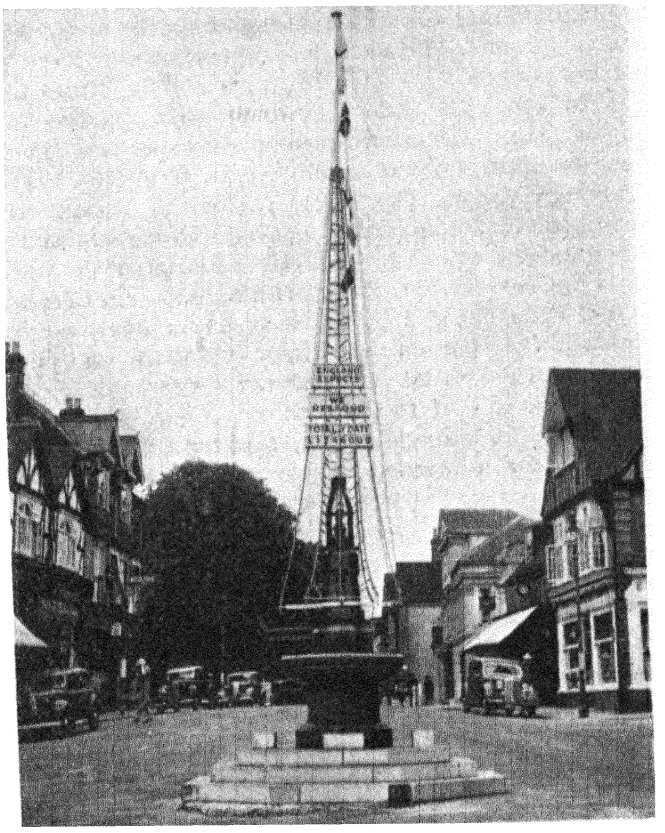
The real object of war economics is to mobilize men and materials with the utmost efficiency and with the least possible delay to win the war. Finance in war time ought not to be the controlling factor. The main functions of money in war economics are positive and negative ; the positive function is to see that the burden is distributed fairly, the negative function is that nothing should be decided on purely financial grounds. This does not mean that the control of expenditure should be neglected, and that audit is superfluous. Far from it. Control and audit see that the money is spent efficiently and in the way intended. When we say that finance in war time should not be the controlling factor, all we mean is that it should not be allowed to impede the solution of the physical problem. And it must be admitted that from this viewpoint the British war time finance system is far from perfect. For financial considerations to hold up the right solution of

military problems is bad, but for financial considerations to dictate a wrong solution is much worse. Finance cannot contribute much to the actual winning of the war, but it can see that the burden is spread with equity and that the war is won with the minimum of disturbance to society.

The choice between paying for the war from taxation or from loans, or from both, is sometimes misunderstood. How often we hear it said that by borrowing instead of taxing, we are placing the burden on posterity! This, however, is not true. It is clear that by borrowing rather than by taxing, the government relieves those actually living and working today from paying taxes only to the extent that it takes from them by way of loans money which belongs to them, thus equally depriving them of current spending power. All that borrowing, in preference to taxation, does is to place on future generations a technical problem, that of taking money from the pocket of the taxpayer and putting it in the pocket of the debt-holder. Both are members of the same society and both are often the same person. This does not impose a real burden on the community as a whole, just as the process of raising a loan does not relieve a community of its real burden, which is a current effort and cannot be put, save with three exceptions, on the past or the future. If a community borrows from abroad, it obtains additional resources in the form of aeroplanes and other munitions of war. It has to make a future deduction from its resources when it pays interest or repays capital. When drawing on investments, it also increases its present resources but at the expense of having less in the future. In the present war, Great Britain was drawing on her investments in the United States to pay for goods imported. In August 1939, her gold and dollar resources were $4,483 millions, but on September 1, 1941, this had fallen to $697 millions. At home, the most important factor in domestic dis-investment was the non-replacement of trading stocks which were falling to rock-bottom levels.

The third exception, namely, the failure to keep in good repair capital in the form of machinery, etc., leaves for the future the making good of the deficiencies arising from not allowing for depreciation. The rule, however, in spite of these exceptions, is that the real burden of the war is on those who are compelled to do without the goods and services which they would have enjoyed had not these been made over to the production of munitions. Sacrifice, in short, is borne by those living at the present time, who must provide the men and materials needed to prosecute the war in 1942.

Great Britain. The fourth war budget was presented to the House of Commons on April 7, 1941, and was the nearest approach since the war to what a war budget should be. It added several million to the number of income tax payers, raised the rate of direct taxation on the highest incomes to 19*s.* 6*d.* in the £, and above everything else aimed at the prevention of inflation. The real menace in war finance, as already shown, is the gap between revenue (including the borrowing of real savings and other assets) at home, and expenditure at home. The chancellor of the exchequer indicated that it would be misleading to take account of expenditure abroad, especially since the Lend-Lease Act had been passed in the United States. In the first 18 months of war, government expenditure was £4,650,000,000, while taxation was £2,000,000,000, overseas resources £1,000,000,000, and the balance of £1,650,000,000 was made up of substantial current receipts of certain extra-



Fox Photos]

THE NATIONAL SAVINGS CAMPAIGN: ONE TOWN'S INDICATOR SHOWING ITS TOTAL, IN THE FORM OF A SHIPMAST FLYING NELSON'S FAMOUS SIGNAL

budgetary funds, mainly the unemployment fund and funds of the government insurance schemes. In addition, the government had the advantage of large sums available for investment since the normal sums to make good depreciation, renewals of buildings and plant and repairs, were greater than was required. Most important of all were the new savings obtained by the national savings movement and other genuine savings seeking investment in government funds. The chancellor framed a budget estimate for expenditure of only £4,207,000,000 for 1941–42, although he indicated that the total war effort represented expenditure far beyond £5,000,000,000. He summarized the financial policy of the government as control of the torrent of excess purchasing power fed by the springs of war time government expenditure. Revenue he estimated at over £1,786,000,000. The corresponding figures for 1940–41 were expenditure £3,884,000,000 and revenue £1,409,000,000. The figures of expenditure in these two years are not strictly comparable, as those for 1941–42 exclude the values of supplies received under the Lend-Lease Act and payments made to the United States, for existing orders at the time of the presentation of the budget.

It is on the revenue side that the budget is of special interest. The whole of the additional money required by taxation was to come from income tax, £150,000,000 in 1941–42 and £250,000,000 in a full year. The chancellor assumed an increase of between £200 and £300 millions in personal savings, and this, added to the new taxation, would bridge the prospective gap of £500 millions. This gap was obtained as follows: purely domestic expenditure (which is vital for the handling of the problem of inflation) he gave as £3,700,000,000. Revenue on the 1940–41 basis was estimated at £1,636,000,000 and the other offsets at £1,522,000,000, a total of £3,158,000,000 or a gap of

£542,000,000. Income tax was increased by 1*s.* 6*d.*, making the standard rate 10*s.* in the £ (6*s.* 6*d.* on the first £165 of taxable income). Personal allowances were reduced for married persons from £170 to £140, and for others from £100 to £80. The exemption limit was reduced from £120 to £110. The earned income allowance was reduced from one-sixth (maximum allowance £250) to one-tenth (maximum £150). The extra tax which anyone paid because of the reduction of personal allowances and of earned income was to be credited to him after the war in the Post Office Savings Bank, with a maximum allowance of £65. The changes in the income tax increased considerably the burden of direct taxation on middle incomes. The amount of income tax, for example, reached the effective rate of 10 per cent on an earned income as low as £140 for a single person, £250 for a married couple and £400 for a married couple with two children. It reached 20 per cent at just over £250, at £400 and at £600 for these cases. There would be more than 3,000,000 income tax payers in 1942 who have never paid income tax before.

The most important single proposal in the budget was the stabilization by subsidy, where necessary, of the prices of all the essential goods entering into the cost of living and also the cost of essential services such as coal, gas and electricity. It was a bold step to assume a liability of which the amount could not be estimated with even approximate accuracy. It was, however, essential if wages were to be stabilized. The aim was to prevent any further rise of the cost of living index number above the then range—25 to 30 per cent above the pre-war level. During 1941–42, food subsidies amounted to about £120 millions. The main groups of subsidized foods were cereals, including flour, bread, oatmeal, milk, tea, eggs and potatoes. The price of food was affected by the subsidies of about £5 millions on the transport of coal and by whatever emerged from the government's agreement with the railway companies. The contribution which the exchequer was making in keeping the cost of living stabilized ensured greater benefits, especially to the poorest section of the workers, than could be obtained by any other measure. It was another proof of the determination of the government to wage battle against inflation.

The budget returns of the nine months of the financial year, i.e., to December 31, 1941, show that in spite of the desire of the chancellor of the exchequer to put the national economy into a strait-jacket he was not altogether successful. Expenditure on consumption goods was still far too general and widespread. The consumption of alcohol and tobacco was high and it is known that the yield of the purchase tax had much exceeded expectation. The budgeted increase for the whole year under customs and excise was £48 millions, but for the nine months an increase of £144 millions had already been realized. During the last six months of 1941 a study of the growth of bank deposits and the circulation of notes shows that money incomes increased sharply. More taxation to curb spending would appear to be called for either in the form of a higher income tax, an excess income tax over, say, the pre-war year or the pre-rearmament year (1937–38) or heavier consumption taxation on goods and services. A greater campaign to obtain savings for war purposes is also necessary. So far inflation had been moderate, not more than 20 per cent after two years of war.[1] Consumption goods were scarce as there was not enough man-power to make more, and there were not enough ships to bring them to the country. As Mr. Keynes stated in December, the total amount which could be bought in the shops and spent on rent, light, fuel, travelling, entertainment and all else was a fixed amount, about £12 millions a day at the prices then ruling. Personal wages and other incomes before income tax was paid were of the order of £16 millions a day. The excess of £4 millions a day must not be spent. Personal savings were £2 millions a day and it covered only half the gap. The remainder of the balance, £2 millions a day, still remained to be drawn off by income tax, and by more intensive saving. Even if this were not done the public could buy no more goods than they were buying then.

The future burden of the national debt is a question that has arisen from time to time since the outbreak of war.[1] On March 31, 1941, the total deadweight debt was £11,513,000,000, the highest in the history of the country. From 1919 until 1938 the total stood at the level of £7,000,000,000. The increase of £2,467,000,000 during the fiscal year 1940–41 was mainly due to a large increase in treasury bills outstanding (£2,212,000,000) and to the issue of loans for the war. On the supposition that prices are kept down during the war and are kept up after the war, and that the average rates of interest do not exceed those of the years 1932–38, the burden will not be great. If the war lasts as long as the last war the net increase in the principal of the national debt is not likely to be more than £10,000 millions. The average rate now being paid is 2 per cent and at this rate the annual cost will be £200 millions a year. This is the gross figure and should be reduced by the amount of tax levied on the interest payments. The net burden is estimated at less than £150 millions. If the post-war price level is that of 1936, then an increase of one-sixth in the rates of taxation, i.e., an income tax of 5*s.* 6*d.* in the £ only will be required. An increase of 20 to 25 per cent above the 1936 price level would solve the problem.

Canada. The year 1941–42 was an *annus mirabilis* for Canada. Canada had raised forces greater in number than those raised by the summer of 1916; in addition, there had been enormous industrial expansion which made the production of munitions beyond comparison with those of 25 years ago. Effective machinery had been set up for preventing unnecessary expenditure abroad, for restricting the supply of luxuries, for collecting direct taxes from at least one-fifth of the whole population. Prices, wages, and rents were controlled in this year of pronounced progress. Domestic prices were not allowed to exceed the maxima charged between September 15 and October 11, 1941. Basic wage rates had been stabilized in relation to the general price level throughout industry, with certain exceptions, by a cost of living bonus subject to periodic revision. These measures put a brake on the possibility of inflation. It may, in the future, be necessary to restrict production and the sale of goods unessential to the war effort unless the government can obtain borrowings in sufficient amount from actual savings. Canadians may, with justification, take pride in what has been accomplished. The expenditures of the Dominion government, including the assistance given to the United Kingdom, but excluding all provincial and municipal expenditures, would in 1941–42 amount to nearly 50 per cent of the national income. Before the war, it was estimated that government—federal, provincial and municipal—spent 25 per cent to 30 per cent.

[1] Cf. "Types of War Inflation"—A. C. Pigon, *Economic Journal*, December 1941.

[1] Cf. "The Future Debt Burden"—*The Economist*, August 16 and 23, 1941.

Government expenditure was estimated at more than $2,800,000,000; of which about $1,450,000,000 was the estimated direct war expenditure; $470,000,000 was provided for non-war expenditure, and $900,000,000 for the estimated cost of munitions for Great Britain. Tax revenue was expected to yield $1,400,000,000, so that approximately 75 per cent of expenditures would be met from current revenue, leaving the sum of $1,250,000,000 to be found by borrowings.

The federal budget provided for a considerable increase in taxation. Since the outbreak of war, the taxes on tobacco, malt, carbonic acid (for soft drinks), cosmetics, sugar, motor cars and similar commodities, have been raised, and a war exchange tax of 10 per cent placed on imports. The personal income tax has been raised three times, so that it is now quite severe on the intermediate incomes ($2,000 to $10,000). A national defence tax of 5 per cent has been imposed on single people with incomes between $660 and $1,200, and of 7 per cent on incomes over $1,200; on married persons with incomes of $1,200 the rate is 5 per cent. The corporate income tax was raised to 18 per cent and an excess profits tax imposed, so that 75 per cent of excess profits over the basic years is taken. The Dominion has also invaded the succession duty field with a moderate levy superimposed on the existing provincial duties. New taxes have been placed on amusements, and a duty of 3 cents per gallon on petrol or gasoline, both of which were previously provincial fields. The burden of the personal income tax is considerably heavier on the middle classes than hitherto. Agricultural income, however, has been practically untouched in the war taxation; although agricultural incomes have not much increased the agriculturists are relatively better off than before 1939. Considerable re-distribution of income is taking place, a re-distribution which will have considerable social effects.

The bulk of the increase in the national income has gone to re-employed persons and to young persons employed for the first time, whose taxable capacity is not high. Employment has reached a record level. Half of the workers employed by the Canadian manufacturing industries are directly engaged in munition work and war contracts exceed $2,500,000,000. In shipyards, for example, 20,000 workers are engaged, as compared with only 1,500 men at the outbreak of war. Aircraft factory floor space has increased seven times, and workers from 2,300 to 32,000. With full employment approaching, it may be necessary for the government to curtail civilian production. Another factor which has enabled Canada to maintain her civilian consumption, apart from unemployed resources, is the supplies from the United States, which has been a deep reservoir. The war, it may be noted, has aggravated the tendency for Canada to pile up debit balances with the United States and a credit balance with Great Britain. The shortage of dollar exchange has been met in three ways: (1) the import of American goods and services has been reduced by taxation, by import duties and embargoes, and by the ban on free travel in the United States; (2) the American component in goods purchased for Great Britain has been supplied to Canada on lend-lease terms, and (3) the United States has also been purchasing from Canada munitions which the latter is able to produce in large quantities.

A considerable part of the borrowings of Canada are the result of supplies to Great Britain for the winning of the war. The United Kingdom has been in need of Canadian dollars as well as American dollars. At first, down to the end of 1940, the British need for dollars was met by sales of British assets in Canada (40 per cent), by Canadian accumulation of sterling (i.e., short term loans to the British government) 20 per cent and the remainder (40 per cent) by the shipment of gold. The second phase was the accumulation of sterling which marked the year 1941. Canada took payment in sterling which accumulated in London and was invested mainly in treasury bills or other floating debt. At the end of January 1942 a third phase began. Sterling had accumulated to $700 millions (£160,000,000). It was agreed that $295 millions, the proceeds of Canadian securities belonging to residents in the United Kingdom, should be mobilized and used not in the reduction of debt but to pay for further purchases. The $700 millions is to be lent—the question of the ultimate repayment and the rate of interest is to be left for decision after the war. Canada is to supply munitions of war, including foodstuffs up to an amount of $1,000 millions free, i.e., Canada makes a gift of $1,000 millions which is expected to last for a year. These are large figures when compared with Canada's total revenue.

The most interesting feature of Canada's war effort, to date, is that most of the increase in expenditures has been provided by an increased output, and to a less extent by drafts on capital, and only to a small extent by the reduction of consumption on the part of the public.

South Africa. In no part of the British Commonwealth was the financial position more satisfactory than in the Union of South Africa. The Union is, as is well-known, the chief source of gold production in the British Commonwealth. It is true that the passage of the Lend-Lease Act somewhat modified the urgency attached to the demand for gold. Nevertheless, the Union's gold production was still a most important source of purchasing power. It is not possible to say what happens to the gold but the most beneficial use of it is for providing for exchange. It is interesting to note that since the war began there has been an increase of 70 per cent in the holdings of the reserve bank. Like the other Dominions, South Africa had found it necessary to check inflation by means of price control and import restrictions, but the problem had been less strenuously tackled than in Canada and Australia. Rationing had been introduced for some goods, such as petrol, but the control of wages had been imposed only in a few industries such as the making of footwear, and the building industry. The cost of living had risen by only 9 or 10 per cent in spite of a rise of nearly 40 per cent in import prices. The inflationary danger was that war expenditure was being financed by surplus gold rather than by genuine savings. It is desirable that surplus funds should be mopped up by government loans and utilized for the repatriation of external debt, which has been taking place on a considerable scale over the last two years. General activity prevailed not only in the monetary sphere but in commerce and industry. The engineering workshops of the mines and railways have been turned into arsenals. The Iron and Steel Corporation, known as "Iscor," and other engineering firms, textile, clothing, boot and furniture factories, not to mention the canning industry, have been harnessed to war production and over 600 factories are engaged on the production of war supplies. Overtime was being regularly worked, and earnings showed a considerable increase. Mines have been the mainstay of the Union's economic position and during the year 1941 a new high record of production was reached, namely, 14,386,361 oz. of gold valued at £120,845,114,

compared with 14,037,741 oz. of gold valued at £117,917,024 in 1940. Owing to the increase in working costs and severe taxation, the industry showed a decline in actual profits.

In the budget for the year ending March 31, 1943, introduced in February 1942, the government proposed to spend £139,855,000, of which £95,500,000 would be from current income. Mr. Hofmeyr budgeted for a deficit for 1942–43 of £210,577. £80,000,000 would be spent on defence in 1942–43, as compared with £72,000,000 in 1941–42. £40,000,000 would be provided from revenue and the other half from borrowing. The normal gold mines tax was to be unchanged, but the gold mines special contributions tax was to be raised to 20 per cent, which would yield an additional amount of £1,540,000.

The excess profits tax would remain at 13*s.* 4*d.* in the £, but a new tax would be instituted to be called the trade profits special levy. This would be levied on the difference between (*a*) the amount of assessed profits on which the excess profits duty was payable by the taxpayer, having regard to the pre-war standard based on profits, and (*b*) the amount on which such duty would be payable by the taxpayer with a like income but with the minimum pre-war standard. This levy was estimated to produce £4,000,000.

The finance minister also announced variations in the normal and supertax on individuals, including a compulsory saving scheme, and a surcharge of 10 per cent on all income tax payments by individuals, which was estimated to yield £1,550,000. As a war-time measure he announced the further institution of a land sales profit tax, which was estimated to produce £450,000.

Australia. The tale of war finance in the financial year which ends on June 30, 1942, can be briefly told. During the early part of the year there was some hesitation to admit the full logic of the economic necessities of war. Gradually, however, as time went on, it was realized that surplus purchasing power must be skimmed off and that the economy of the nation must be put into a strait-jacket. This can best be illustrated by referring to the major financial facts of the year. On June 27, 1941, the Loan Council met at Canberra to discuss the Commonwealth government's proposals. It was clear that the Australian war effort would involve an increase in the war expenditure of the Commonwealth from £A.80,000,000 to £A.250,000,000 in the coming financial year. The federal treasurer, Mr. Fadden, told the Council that the Commonwealth government foresaw a gap of £A.60,000,000, and that it must make very heavy demands on the taxpayer, and that its demands must take precedence over those of the States. He stated that the States were requested to cease levying income tax for the duration of the war, and instead accept a grant from the federal treasury. The difficulty arose because the amounts levied in State income tax are in some cases very high. The taxpayer in Queensland, for example, had to pay to the State treasurer more than twice as much as a taxpayer earning the same income in Victoria. The controversy resulted in a decision against the proposal. All the State premiers except the premier of South Australia opposed the proposal. When the budget for 1941–42 was introduced on September 25, 1941, Mr. Curtin, leader of the Opposition, indicated that there was fundamental divergence of opinion between Mr. Fadden's Coalition government (the United Australian Party and the Country Party) and the Labour Party. The Labour Party objected to the proposed compulsory loan on the grounds that it would dry up the source of war savings certificates. Mr. Curtin made a frontal attack on the whole plan to extend direct taxation to the smaller incomes (down to £A.150) and he denounced as ungenerous the government's treatment of Service men and their dependents. On the resignation of Mr. Fadden's government, Mr. Curtin's budget was introduced in October; its real feature was the scaling down of the amount provided by new taxes, and an increase in the amount to be covered by new borrowings. Only £A.22,000,000 was to be found from new taxes against £A.32,000,000 under the Fadden budget; £A.138,000,000 was to be borrowed in place of £A.122,000,000. The Australian fighting man was given a substantial increase in his pay, and especially in the form of an allowance for his dependents. There were increases in old age and service pensions. Instead of bringing in those with incomes under £A.200, the new budget took more from those whose incomes exceed £A.1,500, at the same time restricting the exemptions and allowances at all levels. The sliding scale so operates that all incomes over £A.2,500 (or £A.2,000 in the case of revenue from property) pay 16*s.* 8*d.* in the £. The new government implemented certain recommendations made by the Royal Commission on the monetary and banking system of the Commonwealth, "to bring the operation of the trade banks under effective control," publishing regulations for the control of banking operations under the National Security Act in November 1941. The new government, like its predecessor, set its face against inflation through banking channels. As a result of the policy of the Commonwealth bank, advances were limited to the essential needs of war production.

In December 1941, after the extension of the war to the Pacific, more stringent methods were adopted. A special war-time tax on individual incomes was passed by the federal parliament on Dec. 17, and came into force immediately. It tapped a new income field embracing hundreds of thousands of wage-earners. The tax was to be on the actual income less the amount assessed on that income for ordinary federal income tax. It commences at 6*d.* in the £ on incomes of £156 per annum, rising by one quarter of a penny in the £ for every £6 until it reaches 1*s.* in the £ on incomes of £300, when it is stabilized at that rate. A rebate of tax of 1*s.* per week for a wife and for each child is allowed. Military pay under £200 per annum is exempt from this tax and dependents' allowances are exempt from both the new tax as well as the federal income tax. A supertax of 1*s.* in the £ was imposed on company profits, making the company tax 4*s.* instead of 3*s.* in the £. These increases were estimated to bring in in a full year £27 millions.

In February 1942, Mr. Curtin announced that the war cabinet had decided to carry out far-reaching measures designed to accelerate the marshalling of the national resources behind the war effort. Like Canada, Australia then decided to adopt the policy of price and wage stabilization. It was a comprehensive plan to keep prices of all goods, services and wages at the existing levels. Profits were to be pegged at a maximum of 4 per cent; interest rates were to be controlled and the sale or investment of capital except under government licence or for obvious war purposes was prohibited. Nothing was said about rationing, which would appear to be a necessary complement to the pegging of prices and wages; in August 1941, for example, the value of retail sales in Melbourne had increased by 45 per cent, and in Sydney by 35 per cent, as compared with the value of sales at the beginning of the war, and these rises were much greater than could be

attributed to any upward movement of prices. The government also decided to require employers to obtain labour through the labour bureaux, and the dismissal of employees in federal industries was prohibited, as was any change of occupation or employer without federal approval. Persons engaged in industry were forbidden to absent themselves from work for reasons other than sickness or recreational leave, and those illegally absent were to be subject to drastic penalties. The government may take power to put any area under military control in an emergency, and this includes acute industrial trouble. Speculation in commodities such as forward dealing in foodstuffs and other essentials was also prohibited.

New Zealand. The second war-time budget of Mr. Nash, the New Zealand finance minister, showed a large increase in war expenditure. The estimated war expenditure was £NZ 69,700,000, which is £NZ 42,500,000 more than was spent in the previous year 1940–41. It was expected that £NZ 31,000,000 of this would be spent overseas and would be met from advances made by the British government, the remainder being raised and spent in New Zealand. Although £NZ 31,000,000 was to be financed as a loan by the United Kingdom, New Zealand proposed to pay the advance to the full extent that sterling funds permit. Of the £NZ 40,000,000 to be spent in New Zealand, taxation was to provide £NZ 19,346,000, loans £NZ 13,000,000 and cash balances and transfers from the civil budget £NZ 7,654,000. In the civil budget revenue was estimated at £NZ 39,296,000, and expenditure, excluding transfers of war funds, at £NZ 37,712,000. On both sides of the civil budget there was a fall of £NZ 1,000,000 below the corresponding figures of the previous year. No new taxes were imposed as the government recognized the limit to the possibilities of increased taxation and the necessity of avoiding killing the goose that lays the golden egg. The only new expenditure proposed was for additional social security benefits for families with low incomes, invalids, and war veterans. This expenditure for social security benefits was estimated at £NZ 14,673,000.

Another interesting feature of the budget was the amendment of the system of taxing the trading banks in the Dominion, so as to make them liable for social and national security and income taxation only on the actual income earned in New Zealand. For more than 40 years New Zealand bankers have pressed for a change in the method of tax assessment, and with a rising rate of taxation and falling earning power, the incidence of banking taxation under this system had become almost crippling. As in Australia, public works programmes were reduced, but provision for essential national development amounted to £NZ 20,615,000 including £NZ 12,950,000 from loans. The government social expenditure prior to the war has had much the same effect as war expenditure. The recent rapid rise, however, in the latter has diminished the rate of advance in the former. National income, it may be added, has increased as a result of the war, the main beneficiaries being the wage earning classes.

India. During the year India made vast strides in the production of war materials, supplying the Middle East as well as the Far East with as many as 40,000 different kinds of munitions. The effect of the war on Indian finance has been very great but it does not show the entire war effort of the Indian empire. Expenditure on defence in the year 1942–43 will be Rs.133 crores,[1] three times more than similar expenditure before the war. The Indian defence estimates covered only the cost of local defence. The amount of expenditure, for example, that the government of India will spend on defence services and supplies that they will recover from the British government under the financial settlement between the two countries will exceed Rs. 400 crores (£300,000,000) in 1942–43. The total budget expenditure is estimated at Rs. 187 crores 7 lakhs. Revenue at existing levels of taxation when the budget was presented on February 28, is estimated at Rs. 140 crores. There is thus a deficit of over Rs. 47 crores. To meet this Rs. 12 crores will be raised by new taxation and Rs. 35 crores by borrowing.

In direct taxation it is proposed to (1) make incomes between Rs. 1,000 and Rs. 2,000 liable to taxation, but the liability may be discharged if the person assessed deposits one and a quarter times the amount of tax in defence savings, which will be repayable with interest at 2½ per cent one year after the war; (2) increase the present surcharge of income on a graduated scale; (3) retain the excess profits tax at the existing rate of 66⅔ per cent but the government will contribute up to one-tenth of the tax paid to a reserve for re-equipment of industry after the war, provided the assessed person doubles the amount. The assessee's deposit will be repayable within twelve months after the end of the war and will earn 2 per cent simple interest. In indirect taxation there will be an emergency surcharge of one-fifth on all customs import duties except petrol, the tax on which is increased from 12 to 15 annas a gallon, raw cotton, on which the duty is doubled, and specified imports from Burma which are excluded. There is no change in the duty on salt but the excise duty on kerosene has been raised to the level of the increased import duty. Minor increases have been made in post and telegraph rates.

The most interesting point in the budget is perhaps the sterling debt repatriation which has taken place, consequent on the piling up of sterling balances in London. The total sterling debt has been reduced by £101,600,000 and the annual interest payments in sterling by more than £4,000,000. In 1942–43 further repatriation of overseas debt will take place. Another feature of considerable interest to the Provinces is the fact that Rs. 8 crores 37 lakhs will be their share of the income tax, and as Sir Jeremy Raisman, the finance member, said: "This is considerably more than the total sum which, at the time of the Niemeyer Award, the Provinces were expected to receive at the end of the ten-year devolution period or than ever appeared to be possible before the outbreak of war."

Germany. In 1941–42 revenue was estimated at Rm. 32,000 millions against Rm. 27,200 millions in 1940–41, an increase of nearly 18 per cent. To this should be added the war contributions of the communes plus the charges levied on the occupied countries which should bring in some Rm. 13,000 millions—a total revenue of Rm. 45,000 millions. If borrowing continued at the same rate, the total available for public expenditure should be of the order of Rm. 90,000 millions. In short, revenue, borrowing and foreign tribute will exceed four-fifths of the gross national income of Greater Germany, a very high proportion. It was, however, necessary to "steer" purchasing power by taxation and by systematic saving more than ever before. The pressure of excess purchasing power in 1941–42 made an increase in taxation necessary despite the fact that the revenue from taxes was already buoyant. The surcharge on cigarettes, cigars and tobacco was raised from 20 per cent to 50 per cent of the retail price while the war duty on brandy was

[1] Rs. 1 crore as Rs. 10,000,000 = £750,000. Rs. 1 lakh = Rs. 100,000 = £7,500.

increased by Rm. 1 per litre and that on champagne by Rm. 1.50. There was no increase on the price of beer. Reinhardt, state secretary of the Reich finance ministry and the chief apologist of Nazi financial policy, told the press that the aim was to reduce consumption and to prevent inflation. The war surcharges on income tax levied after the outbreak of war had produced additional revenue but had differentiated against certain sections of the population. Income tax, the corporation tax and the turnover tax accounts for 70 per cent of the revenue. The yield from the Profit Stop tax proved to be less than 1 per cent of the total. The taxation of wages (which is important in any war tax structure) carries with it in the Reich (1) a minimum subsistence of 54 marks a month; (2) a free exemption of 52 marks a month of a married woman's wage (to encourage married women to go out to work); (3) an exemption for special overtime pay, i.e., not all overtime but only that beyond the maximum working hours fixed by the Trustees of Labour wherever such excess is authorized by the Trustees; and (4) an exemption of all savings including bonuses saved under the "Iron Savings Scheme." The wage earner may deduct a fixed amount up to Rm. 6 a week before paying the wage tax and this is credited to a special savings account, to be withdrawn twelve months after the war. The eight regular deductions (wages tax, war surcharge, civic tax, defence tax on men not conscripted, the three contributions for social insurance and the contributions to the Labour Front and Winter Help) were simplified by the amalgamation of the wages tax and the surcharge and by the suspension of the defence tax. "Iron Savings" were introduced because not until this year was the danger of inflation considered likely owing to the gap between the large amounts of unspent or unspendable money on the one hand and the decreasing supply of consumption goods on the other.

Next as to borrowing. From April 1933 to March 1941 Reich revenue was Rm. 119,200 millions and public debt Rm. 90,000. In 1941–42 there was a large increase in borrowing which indicates a further fall in civilian production and consumption in a national economy now in a strait-jacket. The limit of taxation is said to have been reached since the present level restrains higher production and efficiency. The problem of war finance in the Reich to-day is to place at the disposal of the Reich the additional purchasing power.

The occupied countries pay to the Reich over a fifth of their total national incomes, of which no part or at least a very small part is returned in the form of goods and services. Confiscation of state and private property in various forms amounts to a large sum. The effect of removing great stocks of goods against "promises to pay" is seen in the balance sheets of the central banks. Thus from April 1941 Germany financed her debts in the Netherlands through the Bank of the Netherlands and as a result this German indebtedness was in March 1942 the chief asset of the bank. As a corollary to this inflation of the bank's assets the note issue had greatly risen. German financial necessities were also being financed with the liquid balances left with the Dutch private banks owing to the decrease in stocks and the impossibility of investing these balances in industrial concerns. Exchange rates were manipulated by the overvaluation of the mark, which means that imports from the occupied countries were cheaper and exports to them earned a greater purchasing power over their products. Germany was buying from the occupied countries more than they would be normally prepared to sell and the price paid was from 15 to 40 per cent below that which would rule in a free market. Between one sixth and one quarter of the present war effort by Germany is probably the result of her exploitation of the countries overrun by her.

(G. F. S.)

INTRODUCTION

THE first Britannica Book of the Year appeared five years ago when war seemed only a threat. Today the Book of the Year is presented to a world torn by men's hates and ingenuity's weapons of death. A record of the year of our Lord 1941 shows only a few small areas of the earth's surface where there is no war.

Many of the contributions which make up this volume have come from these fateful places and from the very men and women who are engaged in the vast battle toward peace. Again, as for previous volumes, many manuscripts, by plane and by ship, have won through to Chicago in spite of enemy vigilance—and not one manuscript has been lost! From Pearl Harbor, shortly after the Japanese surprise, a contribution arrived with a letter saying, ". . . . I wrote a little too much and cut it with a pencil. Please excuse this but inasmuch as I lost all my personal possessions, my typewriter, and my ship in the . . . . attack, you will understand. It may interest you to know that one of the files rescued was a water-soaked letter from you and my rough notes for the article. . . ." Here in this volume is the evidence of the folly of any man's assumption of superiority. Men can live peacefully only when they are well-tempered and humble. Those are fated for ultimate disaster who in their desperation dare to be dictators. The swollen arrogance of the Hitlers and the Mussolinis deflate, in the end, like any other balloon. Here in this volume is the evidence of final defeat for all such enemies of decency, understanding and kindness.

Although the world storms, books get published. One's gratitude must go to five hundred busy men and women who have found time to prepare these articles and to the members of Britannica's staff, who, working under pressure and the obvious emotional difficulties of the day, have kept earnestly and tirelessly at work—to Mr. John V. Dodge, assistant to the Editor; to Mrs. M. H. MacKay, who directed the organization of copy for the printer; to Mrs. Harriet Milburn, head proof-reader, and her colleagues; to Mrs. Ruth L. Breed, secretary to the Editor, who directed the preparation of the thousands of letters and telegrams and cablegrams necessary to bring the contributions from all corners of the available world. Most of all, one's gratitude must go to the publishers of Encyclopaedia Britannica, who by careful planning and wise direction have made possible the production of this annual volume.

The Editor

EDITORS AND CONTRIBUTORS

WALTER YUST, EDITOR OF ENCYCLOPAEDIA BRITANNICA AND OF THE BRITANNICA BOOK OF THE YEAR

LIBRARIAN CONSULTANTS

ANNE FRASER LEIDENDEKER, *Department Librarian, Science and Industry Department, Public Library, Los Angeles, Calif.*

28 Childermas. Holy Innocents' day.

CALENDAR OF EVENTS, 1941

For elections, disasters and assassinations of 1941, see under those headings in the text. For obituaries of prominent persons who died during 1941, see under the entry Obituaries.

JANUARY

1 **Unidentified planes** believed to be German raided parts of Eire; attacks were repeated during two following days, when Dublin was bombed.

2 **Presence of German warplanes** and pilots in Italy to assist in Mediterranean campaign against British admitted in Rome.

William Allen White resigned as chairman of the Committee to Defend America by Aiding the Allies after reported rift on "short-of-war" policies.

3 **First session** of the 77th United States congress convened; Sam Rayburn (Dem., Tex.) re-elected speaker of house.

4 **Syrian high commissioner,** Gen. Henri Dentz, placed under command of Gen. Weygand by Vichy gov't.

5 **Bardia occupied** by Australian shock troops after two-day assault by land, sea and air; British claimed capture of more than 35,000 Italian prisoners.

William D. Leahy, new U.S. ambassador to France, arrived in Vichy.

6 **Pres. Roosevelt,** in annual message to congress, declared U.S.A. should act as arsenal to supply all necessary war supplies to democracies defending themselves against aggressor nations.

7 **Office of Production Management,** new "super-defense" council, established by executive order of Pres. Roosevelt; William S. Knudsen was named director general and Sidney Hillman associate director general.

8 **Budget minimum** of $17,485,528,049 in expenditures for fiscal year 1942, including $10,811,314,600 for defense, presented to congress by Pres. Roosevelt; deficit was estimated at $9,210,093,049.

Husband E. Kimmel named commander in chief of U.S. fleet; navy was divided into Pacific, Atlantic and Asiatic fleets.

9 **Retreat of French forces** on Cambodian frontier after battles with Thai troops admitted by military authorities in Indo-China.

Harry L. Hopkins, special envoy of Pres. Roosevelt to Britain, arrived in London; he conferred next day with Churchill, Halifax and Eden.

10 **Bill giving president** unlimited power to lease or loan U.S. materials of war to friendly foreign powers introduced simultaneously in house and senate.

Germany and U.S.S.R. signed trade agreement described by D.N.B., official nazi press association, as "largest grain deal in history."

Fall of Klisura to Greek forces announced in Athens.

Recapture of Buna in Kenya colony announced by British, who also claimed capture of El Wad in Italian Somaliland and start of advance into Eritrea.

11 **German-Italian communiqué** announced that first joint axis air attack in Mediterranean had damaged four British warships on Jan. 10.

12 **Wendell L. Willkie** endorsed U.S. lend-lease bill, but suggested time limit for presidential powers conferred by measure.

Clarence A. Hathaway, former editor of communist New York *Daily Worker*, expelled from party.

13 **Gen. Ubaldo Soddu** relieved as commander of Italian forces in Albania; Gen. Ugo Cavallero, chief of staff, succeeded him.

15 **Hearings on lend-lease bill** opened by house committee on foreign affairs.

Sir Gerald Campbell, high commissioner to Canada, appointed British minister to U.S.A. to assist Viscount Halifax, new ambassador.

16 **Immediate appropriation** of $350,000,000 for 200 new merchant ships requested of congress by Pres. Roosevelt.

17 **Weapons, ships and planes,** but no armies from U.S.A. in 1941, asked by Winston Churchill in Glasgow speech attended by Harry L. Hopkins.

Kassala in Anglo-Egyptian Sudan recaptured by British.

18 **Marshal Pétain and Pierre Laval** composed differences after meeting, according to Vichy communiqué.

Republican party would "never again gain control of the American government" if it endorsed a blind opposition to lend-lease bill, said Wendell L. Willkie in address at New York city.

British aircraft carrier "Illustrious" bombed by nazi planes in Mediterranean for third time in eight days.

19 **Pres. Roosevelt** conferred with Willkie in Washington and gave him personal note for Winston Churchill.

U.S.A. apologized to Germany for incident in which U.S. sailor ripped swastika flag from nazi consulate in San Francisco.

20 **Franklin D. Roosevelt** inaugurated for third term.

British mechanized forces penetrated Eritrea to depth of 30 miles.

21 **U.S.A.** lifted "moral embargo" on aircraft and aviation gasoline levied against U.S.S.R. during Finnish war.

Renewed disorders between Iron Guard and regular army broke out in Rumania; hundreds killed in clashes of following days.

22 **Tobruk fell** to British after 36-hour attack.

James C. McReynolds resigned from U.S. supreme court.

Wendell L. Willkie left aboard transatlantic plane for "fact-finding" tour of Great Britain.

Japan offered to mediate Thai-French dispute over Indo-China border.

23 **Stalemate** in European war predicted by Col. Charles A. Lindbergh in testimony on lend-lease bill before house foreign affairs committee; he suggested a negotiated peace to end conflict.

Dean G. Acheson nominated assistant sec'y of state by Pres. Roosevelt.

24 **Viscount Halifax,** British ambassador to U.S.A., was personally welcomed to new post by Pres. Roosevelt aboard battleship "King George V" in Chesapeake bay.

Bucharest reported collapse of Iron Guardist rebellion after estimated casualties of 6,000; gov't placed blame for uprising upon Horia Sima, Iron Guard leader.

25 **Rioting in Milan** and other northern Italian cities in presence of German troops reported from Belgrade.

26 **Wendell Willkie** arrived in London.

27 **SOS supposedly sent** by "Empress of Australia" reported British liner sinking off west Africa, but London declared ship was safe and suggested message was nazi hoax.

Japanese Premier Konoye asked "forgiveness of the emperor and the people" for "billions of yen . . . spent and 100,000 officers and men sacrificed" in Chinese war.

28 **Capture of Murzuk** in southern Libya by Free French after forced march from Lake Chad region announced in broadcast by Gen. Georges Catroux, who led assault on Italian garrison.

29 **Alexander Korizis** appointed Greek premier following death of Gen. John Metaxas.

30 **British entered Derna,** Libya, after unexpected 3-day resistance by Italian defenders.

Adolf Hitler declared that ships of any nationality bringing aid to Britain would be torpedoed; he prophesied that 1941 would see complete axis victory.

31 **Thai-French armistice** signed aboard Japanese cruiser at Saigon.

FEBRUARY

1 **Sec'y of Navy Frank Knox** told senate foreign relations committee he was "positive" the axis would invade western hemisphere if Britain were overwhelmed.

2 **Fierce rioting** broke out in Johannesburg, South Africa, between soldiers and anti-British demonstrators.

British armies captured Agordat, strategic mountain railroad town in Eritrea, 100 mi. west of Massawa.

3 **Pres. Batista of Cuba** ousted three "seditious" military leaders, assumed command of republic's armed forces and suspended constitutional guarantees for 15 days.

U.S. supreme court upheld constitutionality of Wages and Hours law; in another decision,

FEBRUARY—*Continued*

the court ruled that disputes between unions do not come under the Sherman Anti-trust act.

4 **British army of Nile** drove 45 mi. beyond Derna and captured ancient city of Cyrene in Libya.

Wendell Willkie flew to Dublin for a "frank, free discussion" with Eire Prime Minister Eamon De Valera.

Lend-lease bill might involve U.S.A. in war in 90 days, Gen. Robert E. Wood of America First committee told senate foreign relations committee.

5 **U.S. secret service** began fingerprinting and photographing Washington correspondents assigned to White House.

Wendell Willkie left London for U.S.A.; he asked newsmen to "tell the Germans" that "we German-Americans hate tyranny and the nazi regime."

6 **Pres. Roosevelt** named John G. Winant to be U.S. ambassador to Great Britain.

7 **British forces in Africa** captured Bengasi, major Italian port in east Libya.

Germany's annual wartime tax bill estimated at 34,000,000,000 marks by E. W. Schmidt, director of the Deutsche bank.

8 **Lend-lease bill,** empowering Pres. Roosevelt to transfer military equipment to Britain, passed in house of representatives by vote of 260 to 165.

9 **British need for U.S. tools** and war supplies rather than U.S. soldiers emphasized by Churchill in radio broadcast.

British warships hurled 300 tons of shells into Genoa, damaging oil tanks, ships and main power plant; 72 civilians killed and 226 wounded in bombardment, Rome announced.

Pierre Etienne Flandin resigned from foreign ministry in Vichy cabinet and was succeeded by Adm. Jean Darlan, who also took over post of vice-premier.

10 **Great Britain** broke off diplomatic relations with Rumania.

11 **Wendell Willkie,** in U.S. after war tour of England, urged U.S. to speed aid to Britain.

14 **Bill raising the ceiling** on U.S. national debt from $49,000,000,000 to $65,000,000,000 approved by senate.

British parachute soldiers landed in southern Italy in attempt to sabotage communications; Rome reported all were captured.

15 **Pres. Roosevelt dispatched James B. Conant,** president of Harvard university, to England on mission to exchange war science data with British.

16 **Britain in desperate and immediate need** of U.S. help, declared Harry Hopkins on return from 4-week trip in England.

17 **Japan,** through official spokesman, offered its services to end all wars, and blamed U.S. and Britain for continued conflict.

Bulgaria and Turkey signed nonaggression pact.

Supreme court upheld decision sentencing Earl Browder, general sec'y of U.S. communist party, to four years in prison for passport fraud.

Royal air force, in 1,800-mi. round-trip flight, dropped leaflets over Poland.

18 **Large Australian army** landed at Singapore; Canadians advised to leave China and Japan.

U.S. Undersec'y of State Sumner Welles rejected Japan's mediation offer; said United States was more interested in deeds than in words.

19 **Fortification of Guam** naval base voted by U.S. house of representatives.

20 **British armies** crossed Juba river and penetrated Italian Somaliland.

21 **Soviets expelled Maxim Litvinov,** former foreign commissar, from central committee of communist party for "inability to discharge obligations."

A "dangerous situation" might result from Anglo-American defense measures in the far east, Japanese Foreign Minister Yosuke Matsuoka warned.

Rome gov't slashed rations of fats, olive oil and butter by 50%.

23 **Premier Mussolini admitted Italian defeats** in Libya and Greece, but declared that German aid would help him defeat British and Greeks.

Sixteen strikes blocked $60,000,000 in defense orders in factories throughout U.S.

24 **Hitler** announced in a speech in historic Munich beer-cellar that he was planning a gigantic U-boat war against Britain.

"White race must cede Oceania" to the Japanese, Foreign Minister Yosuke Matsuoka told Japanese diet; he defined "Oceania" as huge area in Pacific capable of supporting 600,000,000 people.

Pres. Roosevelt asked congress for $3,812,311,197 in appropriations for army.

Office of Production Management placed aluminum on priorities list.

Communist party of U.S. named Robert Minor as general sec'y.

25 **Pres. Roosevelt placed bans** on export of beryllium, graphite electrodes, atropine, belladonna, sole leather and belting leather.

Soviet union approved budget of 215,400,000,000 roubles, a third of which was earmarked for national defense.

26 **British armies captured Mogadishu,** capital of Italian Somaliland, climaxing 220-mi. dash in 48 hours.

27 **Italy sent Spain a bill** for 7,500,000,000 lire for aid given Franco during Spanish civil war.

U.S. war department sent two squadrons of planes to the Philippines and six squadrons to the new Alaskan base.

Ginger Rogers and James Stewart won 1940 awards of Academy of Motion Pictures for best cinema performances of year.

28 **A plan** offered by the Office of Production Management ended C.I.O. strike at Bethlehem Steel corporation's Lackawanna plant.

Senator Wheeler assailed lend-lease bill as move to war and dictatorship in the U.S.

U.S. completed secret removal of $8,500,000,000 in gold from New York city to subterranean gold vaults at Fort Knox, Ky.

MARCH

1 **Bulgaria** signed Rome-Berlin-Tokyo pact, permitting German troops to march into Sofia.

German military authorities fined the city of Amsterdam 15,000,000 guilders as a penalty for disorders against nazi occupation.

2 **Turkey closed Straits of Dardanelles** to all ships, except those having special permits.

Bulgarian Premier Philoff told parliament in Sofia that the German "mission" in Bulgaria was there solely to "preserve peace" in the Balkans.

3 **Soviet union** denounced Bulgarian adherence to axis pact.

Office of Production Management placed magnesium on U.S. defense priorities list.

5 **Nazis passed death sentences** on 18 Netherlanders convicted of committing acts of terrorism and sabotage against Germans.

Ex-King Carol of Rumania and Mme. Lupescu fled Spain and crossed frontier into Portugal.

6 **U.S. requested Italy** to close two consulates in U.S. and to restrict the movements of Italian consular agents.

7 **Pres. Roosevelt** denounced jurisdictional strikes hampering defense production.

Office of Production Management placed nickel and neoprene and other synthetic rubbers on defense priorities list.

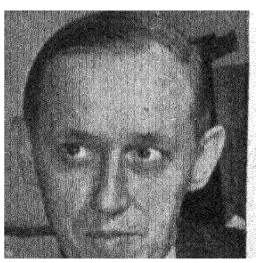
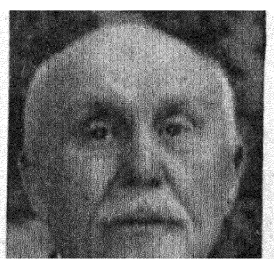
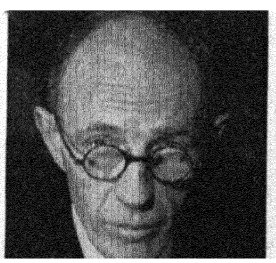
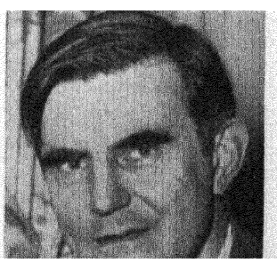
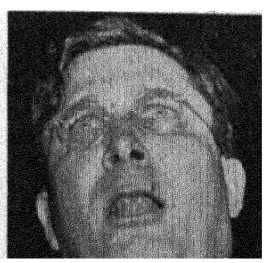
HOPKINS ..... Jan. 9
PÉTAIN ..... Jan. 18
HALIFAX ..... Jan. 24
WINANT ..... Feb. 6
WILLKIE ..... Feb. 11











MARCH—*Continued*

All Italian Somaliland fell to British troops; Italians fled into Ethiopia.

8 **Senate passed lend-lease bill** by vote of 60 to 31.

"The democratic way of life" in the United States could not survive if democracy over the rest of the world died, Pres. Roosevelt said in radio broadcast.

Rumanian Premier Antonescu gave Hitler, Goering and Mussolini power to veto all Rumanian economic agreements with foreign countries.

Greeks resumed offensive in Albania.

10 **Marshal Pétain appealed to U.S.** for food to ward off famine in France; Vice-Premier Admiral Darlan said French navy would fight if Britain interfered with food convoys.

France, under Japanese pressure, ceded Indo-Chinese territories to Thailand (Siam).

Bus strike tied up New York city traffic.

11 **Lend-lease bill** signed by Pres. Roosevelt.

Nazis sank 29 ships totalling 148,038 tons in week ending March 2, London admiralty admitted.

12 **Pres. Roosevelt** urged congress to appropriate $7,000,000,000 to speed arms to the democracies.

Prime Minister Churchill thanked the U.S. for enacting the lend-lease bill, which he termed a "new Magna Carta."

14 **Naval bill** asking $3,446,585,144 for building of two-ocean navy was passed by U.S. house of representatives.

15 **Pres. Roosevelt** in radio speech told U.S. that entire nation had to make sacrifices in order to defeat dictatorships.

16 **No help could save Britain,** Chancellor Hitler told audience of nazi leaders.

17 **The "Bremen,"** 51,000-ton German liner, was reported ablaze.

19 **U.S. house of representatives** passed bill earmarking $7,000,000,000 to aid "democracies resisting aggression."

Pres. Roosevelt announced creation of 11-man board to mediate strikes involving defense industries.

U.S. and Canada signed pact to develop Great Lakes-St. Lawrence waterway "for defense purposes."

20 **Plymouth** shattered by nazi air raid.

Throngs in Sydney cheered arrival of seven U.S. warships.

21 **Three Yugoslav ministers** quit cabinet in protest against gov't's readiness to join axis.

New York bus strike ended after 11 days.

22 **Grand Coulee dam** in Washington started operation, two years ahead of schedule.

24 **C.I.O. called strike** at Bethlehem Steel plant, Bethlehem, Pa.

25 **U.S.S.R. and Turkey** exchanged neutrality pledges.

Yugoslav Premier Cvetkovitch and foreign minister signed axis pact in Vienna.

Marshal Graziani "retired at his own request" as commander of Italian armies in Libya and as chief of the Italian general staff.

26 **Yugoslavs revolted** against axis pact; heavy police detachments guarded Belgrade.

French colonial garrisons clamped martial law on several Syrian cities after uprisings in Damascus and Aleppo.

British cut meat ration to six ounces weekly per person.

27 **Yugoslav army** ousted pro-axis government leaders and placed young King Peter II on throne. Gen. Dushan Simovitch, new premier, rushed mobilization of 1,200,000 men; Belgrade greeted coup with joy; U.S. promised moral and material support to new anti-axis regime, and Churchill vowed to help Yugoslavs "to defend their freedom and native land."

British troops seized Cheren, important city in Italian Eritrea.

28 **Bethlehem plant in Johnstown, Pa.,** and C.I.O. strikers signed agreement to end walkout, while C.I.O. workers at another Bethlehem plant in Cambria, Pa., started new strike.

29 **British Mediterranean fleet** battered Italian naval units in fierce engagement off Cape Matapan, Greece, sinking three cruisers and two destroyers and crippling a 35,000-ton battleship.

30 **U.S. seized 65 axis-controlled ships** docked in U.S. ports.

French shore batteries in Algeria fired on British naval units attempting to intercept a French convoy believed laden with war supplies for German units in Africa.

C.I.O. strikers voted to return to work at International Harvester plant in Chicago.

German and Italian nationals fled from Belgrade.

31 **Germany and Italy** protested to U.S. against ship seizures; U.S. department of justice issued warrants to arrest 100 nazi and 775 Italian seamen on charges of sabotage.

Yugoslavia's armed forces ready for war, Premier Gen. Dusan Simovitch told country in proclamation; nazi envoy left Belgrade.

Strike launched by 400,000 soft-coal miners after operators and C.I.O. leaders failed to reach agreement.

Violence flared at Allis-Chalmers plant near Milwaukee when police used armoured car and tear gas bombs to disperse 3,000 C.I.O. pickets who tried to prevent nonunion men from entering the plant.

APRIL

1 **Germans charged Yugoslavs** with persecution of German racial minorities.

British forces in Africa captured Asmara, capital of Italian Eritrea.

Gov. Heil of Wisconsin ordered work halted in Allis-Chalmers plant after C.I.O. pickets and sympathizers engaged in three-hour battle with police.

2 **C.I.O. strike** forced closing of Ford's River Rouge plant.

Four were killed and six wounded in riots between soft-coal strikers and nonunion miners in Harlan, Ky.

3 **U.S. asked Italy** to recall her naval attaché to Washington.

Nazi-Italian armoured units in Libya forced British troops to evacuate the port of Bengasi.

4 **German armies,** pouring through Hungary, Rumania and Bulgaria, massed at frontiers adjacent to Yugoslavia and Greece.

Pro-axis leader in Iraq ousted pro-British premier in coup d'état.

5 **Aduwa fell** to British troops in Ethiopia.

6 **Nazi armies invaded Yugoslavia and Greece;** Hitler denounced Belgrade government for "intriguing" with Britain; U.S.S.R. signed 5-year nonaggression and friendship pact with Yugoslavia; nazis bombed Belgrade.

U.S. Sec'y of State Hull assailed nazi invasion of Greece and Yugoslavia as "barbarous"; controlled soviet press also blamed nazis for invasion.

Addis Ababa capitulated to British army in Ethiopia.

U.S. Defense Mediation board won agreement from both management and union to end 75-day Allis-Chalmers strike.

7 **Royal air force bombed Sofia,** Bulgaria; Yugoslavs took Scutari in Albania after launching offensive against Italian forces; Greeks lost Thrace to nazi armoured units, but resisted panzer thrust into Struma valley.

London severed diplomatic relations with Budapest.

Britain raised basic income tax rate 50% to 10 shillings on the pound.

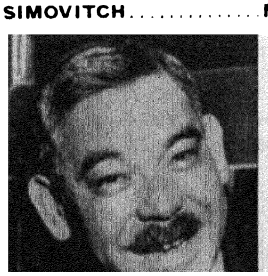
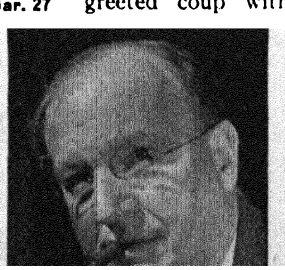
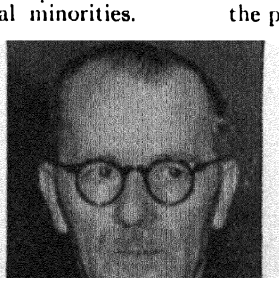
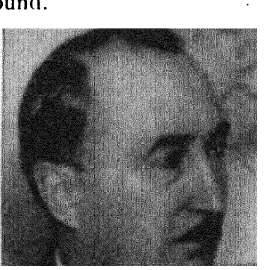
MATSUOKA	Feb. 21
WHEELER	Feb. 28
CAROL	Mar. 5
CVETKOVITCH	Mar. 25
SIMOVITCH	Mar. 27









APRIL—*Continued*

NLRB ordered collective bargaining elections among workers at Ford's River Rouge and Lincoln plants and at Bethlehem Steel's Lackawanna plant.

"Honour" forbade French attack on British, Marshal Pétain declared in broadcast to nation.

8 **German army** broke through Vardar valley pass, menacing Greek force defending Salonika; nazi forces in Yugoslavia took Skoplje.

Axis forces in North Africa captured Libyan port of Derna; British retreated to Tobruk.

9 **Nazi army captured Salonika,** splitting Greece in two; Yugoslav army pierced Italian line in northern Albania, taking two towns; Nish fell to German troops advancing in Yugoslavia.

British planes bombed heart of Berlin, damaging State Opera house and other buildings.

German and Italian forces in Libya captured six British generals and 2,000 men; British took Massawa, port in Italian Eritrea.

Prime Minister Churchill appealed to U.S. for aid in keeping Atlantic sea lanes open.

10 **U.S. revealed agreement** with Danish envoy in Washington to protect Greenland against aggression, giving U.S. right to build bases on island.

80,000 Greek prisoners taken in fighting east of Vardar river valley, German high command announced; Berlin also reported capture of 20,000 Yugoslav prisoners and important gains in Yugoslavia. Turks ordered evacuation of Istanbul.

11 **Ten-day Ford strike** settled by Governor Van Wagoner of Michigan; both Henry Ford and C.I.O. agreed to concessions.

Nazi mechanized units launched fierce attack against Anglo-Greek flank in the Florina area; German troops swept through Yugoslavia and made contact with their Italian allies; Hungarian armies invaded Yugoslavia.

12 **Italians claimed advance** in Yugoslav-Albanian frontier sector; Hungarian army occupied Subotica; U.S.S.R. denounced Hungary for invading Yugoslavia.

Nazi-occupied Denmark declared "void" the agreement signed between U.S. and Danish envoy in Washington.

13 **Soviet union and Japan** signed neutrality pact under which Russia recognized Tokyo's suzerainty over Manchoukuo while Tokyo pledged to respect the Moscow-dominated Outer Mongolian People's Republic.

Nazi mechanized troops occupied Bardia in Libya, driving British forces back across the Egyptian frontier.

Stiff Anglo-Greek resistance slowed German drive in Balkans; nazi troops occupied Belgrade.

Pope Pius, in annual Easter message, appealed to all belligerents to refrain from using "still more homicidal" weapons.

14 **German-Italian motorized forces** crossed the Egyptian frontier, taking town of El Sollum.

British troops retired to new defense line in Greece near Mount Olympus; German high command said Yugoslav army was virtually destroyed.

15 **Nazi army advanced 60 mi.** into Greece; Italian forces launched twin offensive on the Greek-Albanian frontier; Hitler and Mussolini gave recognition to new, independent state of Croatia.

U.S. army should be prepared to fight anywhere, Sec'y of War Stimson said.

Four men were killed, including president and vice-president of a coal mine, and a score were wounded in gun battle involving striking miners and operators of coal mine near Middlesboro, Ky.

16 **Nazis established new line** 60 mi. within Greece; surrender of the second Yugoslav army based at Sarajevo announced by German high command; Greek troops abandoned Koritza to Italian forces on Albanian front.

Steel prices in U.S. were "frozen" at prevailing levels by Price Administrator Henderson.

17 **Entire Yugoslav army surrendered;** German tank divisions methodically drove back Greek and British armies.

Axis drive eastward along north African coast stalled near Egyptian frontier.

U.S. motor car industry voluntarily agreed to cut production by 1,000,000 cars, beginning Aug. 1, 1941.

18 **Allied armies in Greece** retired to new lines.

Retaliating for nazi raid of April 16 on London, R.A.F. subjected Berlin to a heavy bombing.

19 **Nazi troops captured Mt. Olympus** from Australian units.

British landed strong forces in Iraq to guard Mosul oil fields.

Vichy dispatches said 53 French vessels had been "requisitioned," presumably by nazis.

Soviet-Japanese pact aimed at "foiling" Anglo-American efforts to draw U.S.S.R. into war, declared *Pravda*, official communist party organ.

20 **U.S.-Canadian pact** for co-operation in producing war materials for Britain was signed by Prime Minister Mackenzie King and Pres. Roosevelt.

21 **Nazis reported British armies** in Greece fleeing in evacuation ships.

Emmanuel Tsouderos became Greek premier, succeeding Alexander Korizis, who had committed suicide.

22 **King George II of Greece** fled Athens for Crete as the Greek army of Epirus and Macedonia surrendered to nazis; British forces held the mountain pass at Thermopylae.

23 **British and Greek troops** slowed up nazi drive in rearguard action to cover evacuation; nazi armoured divisions broke through Thermopylae pass.

1,000 tons of shells were poured into Tripoli by British warships.

24 **Allied rear-guard troops** delayed German forces at Thermopylae pass; nazi bombers pounded Peiraeeus, port of Athens, while German mechanized divisions advanced to within 35 mi. of the Greek capital.

25 **Immediate extension** of U.S. neutrality patrol areas in Atlantic waters was announced by Pres. Roosevelt.

26 **German panzer units** raced across Corinth canal in effort to trap fleeing Allied troops near Athens.

27 **Increasing U.S. aid** would help British empire pass through the "long, stern, scowling valley" of war to victory, Churchill declared in a broadcast to the empire and the U.S.

Nazi mechanized divisions marched into Athens; German forces also occupied Patras on the Peloponnesus.

28 **British imperial armies** continued to evacuate Greece; Berlin claimed destruction of 285,000 tons of British shipping in Greek waters; Italian troops occupied Corfu.

Col. Lindbergh resigned his commission as a reserve officer in the U. S. air corps, declaring that Pres. Roosevelt's remarks questioning his loyalty left him "no honourable alternative."

U. S. supreme court decision ruled that Negroes are entitled to train accommodations equal to those given white passengers.

The 28-day strike of the soft-coal miners in the U. S. ended as coal operators in the southern states agreed to a wage boost of $1 per day.

The Venezuelan congress elected Gen. Isaias Angarita Medina president of Venezuela.

29 **Soviet union** banned shipment in transit through U.S.S.R. of war materials destined for foreign use.

British authorities evacuated women, children and aged from Plymouth after a series of fierce nazi air raids.

30 **British succeeded** in evacuating 48,000 of the 60,000 troops originally landed in Greece, Churchill told commons.

Russian press reported that 12,000 German troops, equipped with tanks and big guns, had landed at Abo in southern Finland.

MAY

1 **U. S. Maritime commission** announced plans were underway to shift 50 U. S. oil tankers to the service of Britain.

Lord Beaverbrook was transferred from the ministry of aircraft production and became British minister of state.

Iraqi troops massed at Habbania airdrome after the British rejected an ultimatum from the pro-axis Baghdad government to evacuate the airfield.

Sale of U. S. defense bonds and stamps was opened to the public.

2 **Iraqi artillery** shelled the British forces holding the Habbania airdrome.

3 **British beat back** Iraqi troops in the Basra area while R.A.F. planes bombed Iraqi batteries shelling British garrison in Habbania airfield.

Italy annexed Ljubljana, capital of Slovenia—a Yugoslav territory—and the area surrounding it.

Federal Communications commission adopted new regu-

MAY—*Continued*

lations designed to prevent monopolies in radio broadcasting.

4 **Pres. Roosevelt** declared the U. S. "ever ready to fight again" for its existence; Hitler boasted that Germany and her allies could defeat "any possible coalition in the world."

5 **Robert E. Sherwood** won the annual Pulitzer prize for drama with his play *There Shall Be No Night*; the New York *Times* and Westbrook Pegler, columnist, also won Pulitzer awards.

Two French freighters with 14,000 tons of U. S. flour in their holds reached Marseilles.

6 **U. S. Sec'y of War Stimson** urged the United States to use its navy to escort war supplies to Britain.

Joseph Stalin assumed the premiership of the soviet union following the resignation of Vyacheslav Molotov from that office; Molotov, however, continued in the post of foreign commissar.

Eleven American fliers, who ferried planes across the Atlantic from Canada to Britain, were reported among the 122 persons lost at sea when the boat on which they were travelling was sunk by a torpedo.

The U. S. banned all exports to the soviet union of machinery or equipment needed for U. S. defense production.

Haile Selassie returned to the Ethiopian throne he lost in 1936 to Italian armies.

7 **House of representatives** voted 266 to 120 to seize foreign vessels tied up in U. S. ports.

House of commons approved Britain's war policy in a 447 to 3 vote of confidence given to Churchill.

British land forces, aided by the R.A.F., succeeded in breaking the siege laid by Iraqi troops around Habbania airdrome.

German authorities, in a deal with French Vice-Premier Darlan, agreed to cut the cost of military occupation of France by 25%.

8 **Waves of nazi bombers** swarmed over Britain, striking particularly at the Hull area; British reported shooting down 50 of the raiders in 30 hours.

Axis planes raided the Suez canal zone.

Germany, in a note delivered to the state department, protested the U.S. government's move to seize German ships tied up in U.S. ports.

9 **Three hundred British planes** poured tons of bombs over Hamburg and Bremen.

Soviet Russia withdrew diplomatic recognition from the exiled governments of Yugoslavia, Belgium and Norway.

10 **Nazi bombers** "blitzed" London, subjecting the British capital to a fierce battering.

1,443 merchantmen totalling 5,961,044 tons employed in British interests had been sunk since the war began, the admiralty disclosed.

Eleven shipbuilding plants in the San Francisco area working on defense contracts were shut down by a strike.

Rudolf Hess, Hitler's personal deputy, flew to Scotland and made a parachute landing near Glasgow; he broke his ankle on landing, was rushed to a hospital and held incommunicado.

11 **Nazi bombers** showered London with 100,000 bombs, destroying house of commons chamber and damaging Westminster abbey, Westminster hall, the Egyptian section of the British museum and Big Ben.

12 **German statement** on the flight of Rudolf Hess to Scotland said the nazi leader was suffering from "hallucinations and a mental disease."

Adm. Darlan, Vichy vice-premier, conferred with Adolf Hitler.

13 **Germans** proclaimed the northern part of the Red sea a war zone.

14 **Bill** increasing the crop loan rate from 75 to 85% of parity was passed in the senate.

Twenty-one "flying fortresses" completed a secret mass flight to Hawaii.

15 **General Motors corp.** averted a strike of 250,000 workers at 61 plants by accepting a National Defense Mediation board peace plan and giving workers a 10-cent-an-hour wage boost.

Marshal Pétain placed his stamp of approval on the Darlan-Hitler talks and appealed to the French people to follow him on the road of "honour and national interest."

Pres. Roosevelt, concerned over Franco-German "collaboration," appealed to the French people not to support the Pétain policy.

U.S. Coast Guard, acting on the president's orders, seized every French vessel, including the giant liner, "Normandie," in U.S. harbours.

Bolivian gov't decreed expropriation of the Lloyd Aereo Boliviano, a German airline operating in Bolivia.

Completed five months ahead of schedule, the 35,000-ton U.S. battleship "Washington" joined the fleet.

16 **Royal Air Force** planes bombed German troop-carrying planes based at airdromes in Syria; Britain announced that Syria was "enemy-occupied territory" and proclaimed the Syrian coast a danger zone.

Key town of El Sollum on the Libyan border was stormed and recaptured by British.

17 **The axis air forces** and the R.A.F. traded blows in the near east, with German planes bombing British positions and British raiders attacking German and Italian concentrations in French-controlled Syria.

The soviet gov't concluded a diplomatic and trade agreement with the new Iraqi gov't.

18 **A postwar reconstruction program** giving all nations access to raw materials and banishing nationalistic trade barriers was suggested by Sec'y Hull in a radio address.

The Duke of Spoleto, cousin of King Victor Emmanuel III, became king of Croatia.

19 **Mayor La Guardia** was named by Pres. Roosevelt to head Office of Civilian Defense.

91,000 hard-coal miners ended a one-day strike after anthracite operators agreed to a demand for wage increases and paid vacations.

Agents of the "Big Five" railroad brotherhoods voted to demand a 30% increase in wages to meet the increased cost of living.

Italian force of 7,000 commanded by the Duke of Aosta surrendered to British forces in Alagi, Ethiopia.

20 **The nazis** launched an aerial invasion of Crete, landing 7,000 parachute troops from gliders; Churchill admitted a serious battle was under way for mastery of the island.

British troops seized Feluja, Iraq, 35 mi. west of Baghdad.

Egyptian steamer "Zamzam" was sunk in the south Atlantic in mid-April, it was announced in Berlin; all 312 passengers, including 138 Americans, and the ship's crew were reported safe.

21 **The German foreign office** asked the U.S. to withdraw its diplomatic representatives from Paris, the state dep't. announced.

A submarine, presumably German, sank the U.S. freighter "Robin Moor" in the south Atlantic.

22 **Air-borne nazi parachute troops** won a foothold on Crete, seizing Candia and the Maleme airport; Churchill admitted that the R.A.F. withdrew from the Crete battle because its single airdrome on the island was hopelessly battered; German dive-bombers claimed the sinking of four British cruisers and several destroyers in the Crete action.

British forces in Iraq established new positions only 20 mi. from Baghdad.

A warning to Vichy that Britain would bomb strategic areas in unoccupied zones unless the French immediately halted their German collaboration policy was sounded by Foreign Minister Anthony Eden.

The C.I.O. won a sweeping victory in the collective bargaining poll in two Detroit Ford plants, defeating the A.F. of L. by a vote of 51,866 to 20,364.

23 **German planes** landed reinforcements at Maleme airdrome as nazi air-borne contingents renewed their drive to oust Allied forces from Crete.

R.A.F. bombers crushed an Iraqi counterattack against British forces at Feluja.

24 **The "Hood,"** 42,500-ton British battle cruiser, was blown to bits by the 35,000-ton German battleship "Bismarck" between Greenland and Iceland.

German parachute troops were firmly entrenched in western Crete while nazi bombers continued to blast British warships.

25 **U.S. convoys** aiding Britain would be regarded as a "plain act of war," German Grand Admiral Erich Raeder announced in an interview.

Britain threw a giant naval dragnet around the northeastern Atlantic in the quest for the German battleship "Bismarck."

Narrowly escaping capture, King George of Greece fled Crete for Cairo.

26 **A 15-minute test blackout** was staged in Newark, N.J.

MAY—*Continued*

A new draft of all men who reached 21 after the first registration was ordered by Pres. Roosevelt; it was estimated 1,000,000 youths would be affected.

German forces in Crete drove back British imperial armies to points 15 mi. from Suda bay.

Eire Prime Minister De Valera warned Britain not to apply conscription to Ulster.

27 **The German battleship "Bismarck"** was sunk 400 mi. off the French coast after a running sea battle with British.

Pres. Roosevelt proclaimed an unlimited national emergency to place the U.S. on a war footing.

Churchill abandoned the plan to apply conscription to northern Ireland to avoid friction with the government of Eire.

28 **Germany's air-borne army** captured Canea, capital of Crete, and pressed drive to oust British warships from Suda bay.

R.A.F. planes, raiding an Italian convoy near French Tunisia, bombed port of Sfax and scored direct hit on a French freighter.

29 **British armies** started to evacuate Crete following nazi seizure of Suda bay and Candia.

A general preference order designed to give defense and vital civilian needs first call on all steel products was signed by E. R. Stettinius, priorities director of OPM.

30 **Iraq Premier Rashid Ali** fled to Iran as British troops reached the outskirts of Baghdad.

German forces controlled the whole northern coast of Crete as Anglo-Greek resistance collapsed.

31 **Secretary of Interior Ickes** was appointed by Pres. Roosevelt as Petroleum Co-ordinator for National Defense.

An armistice was signed in Baghdad between Britain and Iraq, ending month-old war.

The British Board of Trade announced that clothing would be rationed, starting June 1.

Four big bombs were dropped on Dublin by unidentified planes, killing 27 and injuring 200.

JUNE

1 **The abandonment of Crete** to the axis was admitted by the British war office in an announcement declaring 15,000 troops were safely evacuated from the island.

2 **Hitler and Mussolini** conferred for five hours at the Brenner pass on axis military and political moves.

Charles Evans Hughes retired as chief justice of the U.S. supreme court.

3 **The British Labour party** voted at its 40th annual convention to continue the war until the axis was crushed.

4 **The R.A.F.** bombed Beirut, in preparation for an invasion of the French mandated territories of Syria and Lebanon.

Axis planes staged their first air raid over Alexandria, Egypt, killing an estimated 150 persons and injuring 200 others.

5 **Sec'y Hull** warned Vichy that a policy of collaboration with Germany would meet with sharp disapproval in the U.S.

6 **Rumours** that the British were seeking peace were branded by Pres. Roosevelt as falsehoods deliberately circulated by nazis.

Bill authorizing the U.S. to requisition foreign ships lying idle in U.S. harbours was signed by Pres. Roosevelt.

8 **An Allied force** of British and Free French troops invaded Syria from three points.

9 **U.S. army** took over strike-bound North American Aviation plant upon order of Pres. Roosevelt.

The Selective Service administration ordered reclassification of essential defense workers "where they have ceased to perform their jobs."

A strike of C.I.O. die-casters closed the Cleveland plant of the Aluminum Co. of America.

Allied forces pushing into Syria neared the key cities of Damascus and Beirut.

10 **A majority of strikers** at the North American Aviation plant voted to return to their jobs.

The U.S. was already in the war, declared Premier Mussolini in a speech to the Italian nation.

11 **C.I.O. strikers** at aluminum plant in Cleveland accepted U.S. Defense Mediation board's plan to resume work on defense orders totalling $60,000,000.

The massing of nazi troops on soviet frontiers increased tension between the reich and U.S.S.R.

12 **Harlan Fiske Stone** was appointed chief justice of the U.S. supreme court by Pres. Roosevelt; Sen. James F. Byrnes (Dem., S.C.) and Attorney-General Robert H. Jackson were named associate justices.

13 **U.S. war dep't asked** for a 50% slash in motor car production.

14 **Pres. Roosevelt** ordered immediate freezing of all assets of axis and axis-occupied countries; Japan was not included in the order.

15 **Italy retaliated** for U.S. action in holding axis assets by freezing U.S. funds in Italy.

16 **Closing of all German consulates,** travel and propaganda agencies in the U.S. was ordered by the state department.

Sec'y Ickes banned shipment of 252,000 gal. of lubricating oil bound for Japan.

Thirty-five survivors of the U.S. freighter "Robin Moor," assertedly sunk by a German U-boat, were rescued by a British vessel, thus accounting for all passengers on the torpedoed boat.

17 **U.S. state department** ordered a ban on the entry of refugees with relatives in Germany and German-occupied territory.

18 **Germany and Turkey** signed a 10-year friendship treaty.

Joe Louis, heavyweight boxing champion, knocked out Billy Conn in the 13th round of a close bout.

19 **Germany and Italy** expelled U.S. consuls in reprisal for action closing all axis consulates in the U.S.

The OPM announced plans to ration rubber in an effort to reduce U.S. domestic consumption by 25%.

20 **Finland** ordered general mobilization.

Pres. Roosevelt branded the sinking of the freighter "Robin Moor" as an act of "piracy" and as a German effort to intimidate the U.S.

Pres. Roosevelt placed a curb on oil shipments from the Atlantic coast to all countries, save the Allies and Latin-American nations.

Ford Motor company signed union shop contract with the United Automobile Workers (C.I.O.).

21 **The U.S.** ordered the Italian gov't to shut all its consulates in U.S. territory.

Damascus, ancient city and capital of Syria, fell to British and Free French forces.

The Moscow radio announced that 1,500,000 Russian children would leave large soviet cities "to participate in various scientific expeditions"; this move coincided with reports that Russian civilians were fleeing western frontiers.

22 **German armies** launched an invasion of U.S.S.R. on three huge fronts stretching from the Baltic to the Black sea; nazi panzer units penetrated Russian Poland.

British Prime Minister Churchill promised economic and technical support for U.S.S.R.; any state that fought against Hitler would have British aid, he added.

Following the lead of her axis partner, Italy declared war on U.S.S.R.; Turkey proclaimed her neutrality.

23 **German mechanized forces** captured Brest-Litovsk.

JUNE—*Continued*

24 Warsaw and Constanta bombed by soviet planes; German forces reported gains on all sectors of Russian front.

Pres. Roosevelt pledged U.S. to give U.S.S.R. all possible aid and ordered the release of $40,000,000 in soviet credits frozen June 14.

25 Nazi panzer divisions penetrated soviet lines south of Kaunas and east of Warsaw; Russian troops repulsed German attacks on the Bessarabian front; Russian planes bombed Finnish cities; Sweden affirmed her neutrality, but announced that permission had been granted for the passage of one nazi division from Norway across Swedish territory to Finland; Turkey assured the soviet union of her neutrality; Pres. Roosevelt announced the neutrality act would not be invoked against Russia.

Leon Henderson, federal price control administrator, stated that the gov't would fix all motor car prices.

26 German motorized divisions cracked Russian lines between Grodno and Bialystok to reach lines 50 mi. from Minsk; another panzer force reached the sector between Luck and Brody; Russian air force pounded nazi bases in Rumania and Hungary; Finland entered the war on the side of the nazis in a "defensive capacity," according to Pres. Risto Ryti.

Pope Pius XII, in a message to the 9th national eucharistic congress in St. Paul, Minn., warned that a current of "black paganism" was menacing the world.

27 Russian troops retreated along a broad sector stretching from Lithuania to the Pripet marshes to prepared positions defending Minsk; Hungary declared war on the soviet union.

U.S. Senate passed bill providing $10,384,821,624 for army appropriations.

The pictures on this page are, left to right:

ICKES ..... June 16
AUCHINLECK ..... July 1
MARSHALL ..... July 3
STALIN ..... July 3
DENTZ ..... July 9

Douglas B-19, giant 82-ton bombing plane, successfully completed test flight in California.

28 4,000 German and Russian tanks engaged in a gigantic battle in the Luck sector of Russian-held Poland; nazi divisions neared Minsk; nazi-Finnish forces launched a dual drive aimed at capturing Murmansk and Leningrad.

29 German tank divisions passed beyond Minsk.

Pres. Roosevelt ordered the induction of 900,000 more men into U.S. land forces for the year beginning July 1, 1941.

F.B.I. seized 29 suspects in the New York area on charges of espionage and conspiracy.

Churchill appointed Lord Beaverbrook minister of supply.

30 Minsk fell to twin German armies converging on the road leading from Borisov to Smolensk; a third nazi army based at Przemysl pierced Ukraine defenses and captured Lwow.

The Vichy gov't severed diplomatic relations with U.S.S.R.

JULY

1 German armies captured Riga; Berlin admitted stiff Russian resistance.

Gen. Sir Archibald Wavell was relieved of the British middle east command and replaced by Gen. Sir Claude Auchinleck; Gen. Wavell took over the India command left by Gen. Auchinleck.

Soviet Russia asked the U.S. for help and offered to pay for war supplies, U.S. state department announced.

Germany and six axis satellites recognized the Japanese-controlled puppet regime in Nanking.

Gen. Hershey, selective service head, ordered the deferment of all prospective conscripts over 28 years of age pending final congressional action on a bill to that effect.

Federal Power commission ordered creation of a 17-state power pool in the southeast U.S.

2 German columns reportedly trapped two Russian armies in the Bialystok sector, capturing 160,000 prisoners; soviet forces sped new defense lines along the Berezina river.

The North American Aviation co. at Inglewood, Calif., taken over by the army on June 9 after a strike closed the plant, was returned to the owners.

3 Soviet Premier Josef Stalin exhorted the Russian people to defend their soil by adopting a "scorched earth" policy.

Russian and German panzer units fought fiercely for control of the Berezina river in the Bobruisk and Borisov sectors; Germans admitted bad weather and Russian resistance slowed the nazi drive; Finnish-German columns pushed toward Leningrad.

Gen. Marshall, U.S. chief of staff, asked for immediate legislation to extend the military service of conscripts and national guardsmen and to permit use of U.S. armed forces beyond the western hemisphere.

4 Red army halted the nazi drive to cross the Berezina; Moscow said nazi casualties and prisoners since the beginning of the campaign totalled 700,000 troops; Berlin claimed the capture of 200,000 Russians and put Russian casualties at 600,000.

5 Powerful soviet counter-attacks checked nazi armoured divisions in the Baltic and White Russian arenas of the Russian front; panzer divisions, far ahead of the nazi main lines, reached outposts of the Stalin line at the Dnieper river, only 300 mi. from Moscow.

R.A.F. units bombed the French "invasion coast" and Rhenish industrial cities for the 21st consecutive day.

6 A century-old border wrangle between Peru and Ecuador flared into clashes between border patrols and rival air forces.

Red army took the offensive in the Lepel and Borisov sectors; German panzer divisions were halted at the Dvina river; nazi-Rumanian army was repulsed north of Jassy.

Southern coal operators signed a collective bargaining contract with C.I.O. miners.

Ten Italian generals and 5,000 Italian troops surrendered to British armies in Ethiopia.

7 Occupation of Iceland by U.S. naval and marine units announced to congress by Pres. Roosevelt.

China would fight on 4 or 14 years to victory, Chungking Foreign Minister Quo Tai-chi declared in a broadcast commemorating the fourth anniversary of the Sino-Japanese war.

8 Nazi war machine was stalled on five principal sectors of the Russian front by heavy soviet counterattacks; Maxim Litvinov, former soviet foreign commissar, exhorted the British to hurl their full weight against the Germans in the west.

U.S. occupation of Iceland was branded as "a stab in the back" by a German foreign office organ.

9 German mechanized units resumed their drive into U.S.S.R.

Gen. Henri Dentz, commander of the Vichy forces in Syria, was authorized by the Pétain government to ask the British for an armistice.

10 Pres. Roosevelt asked congress for additional defense appropriations of $4,770,065,588.

Iceland parliament approved by a 39 to 3 vote the Reykjavik government's agreement permitting U.S. armed forces to occupy the island.

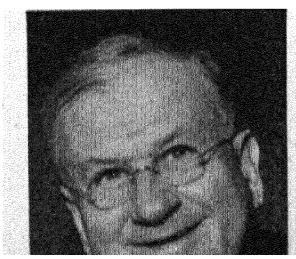
U.S. Navy warned shipping that mines had been laid in the approaches to San Francisco bay.

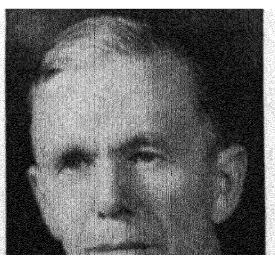
11 Additional appropriations of $3,323,000,000 for the navy and the merchant marine were asked by Pres. Roosevelt.

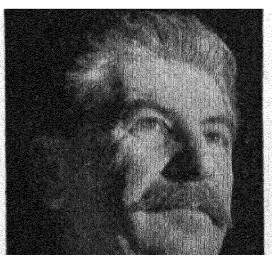
Belfast authorities confirmed the presence of U.S. technicians and labourers in northern Ireland.

12 Breaching of the Stalin line at all decisive points was announced by the German high command; nazi forces took Vitebsk and crossed the Dvina river, menacing Smolensk.

An armistice to end the war in Syria was concluded between the British and Free French forces and the Vichy command.







JULY—*Continued*

13 **Great Britain and soviet Russia** signed a mutual aid pact; each pledged full war aid assistance to the other and agreed not to sign a peace pact except by mutual consent.

German tank columns continued to pound the Stalin line; Moscow admitted the loss of 250,000 men, but claimed the nazis had lost 1,000,000.

14 **Thirteen German troopships,** two destroyers and a tank-laden barge were sunk in the Baltic, Moscow announced.

Japan closed the port of Kobe to foreigners for a 10-day period.

15 **German planes** blasted a path for tank columns moving on Leningrad; a nazi force swept to within 100 mi. of the northern metropolis; Russian counterdrives pushed back German armies along the Dnieper river.

Thirty-three persons were indicted in a federal court in Brooklyn on charges of acting as German espionage agents.

Churchill told commons that the soviet-British mutual aid pact meant that "the Russian people are now our allies."

16 **German high command** claimed capture of Smolensk, 230 mi. from Moscow; Russian forces checked nazi units in the Bobruisk and Novograd Volynsk sectors; Russian air fleet bombed Ploesti oil fields in Rumania; rationing of foodstuffs and manufactured goods decreed in Moscow.

Cabinet of Prince Fumimaro Konoye in Tokyo resigned.

17 **An estimated 9,000,000 men** were locked in battle along the entire Russian front.

Pres. Roosevelt issued a blacklist order freezing funds in the U.S. of 1,800 Latin-American firms having axis ties.

Gen. Franco denounced the U.S. for refusing to ship wheat to Spain.

Joe Di Maggio of the New York Yankees established a modern baseball record by hitting safely in 56 consecutive games.

The second draft lottery to determine the order in which an estimated 750,000 youths 21 years old would be drafted into the U.S. army was held in Washington.

18 **Japanese Premier Prince Konoye** formed a new cabinet, the third headed by him.

19 **Germans announced the "disintegration"** of the Russian front, declaring that Leningrad, Moscow, Kiev and Odessa were threatened by nazi armies; Stalin assumed the post of defense commissar of the soviet union.

Bolivia nipped a subversive plot laid to axis agents, declared a state of siege and demanded the ouster of the German minister.

The U.S. called upon private shippers to transfer an additional 100 oil tankers to Britain.

20 **The British** launched a propaganda campaign called the "V for Victory" drive and designed to stir revolts in axis-occupied countries.

21 **Pres. Roosevelt** urged congress to speed legislation to keep trainees in the army for more than the statutory year limit.

A nationwide drive to collect scrap aluminum for defense needs was launched in the U.S.

22 **German-Finnish forces** pressed drive on the Leningrad front; Moscow admitted nazi gains in the southern Ukraine sector.

23 **Vichy yielded to** Tokyo's demands for military bases in Indo-China, in return for which Japan agreed to "protect" that colony from British and Free French "domination."

24 **Russian armies** claimed to have stopped German drives in vicinities of Leningrad and Smolensk.

25 **Acting together** to balk further Nipponese aggression in the far east, the U.S. and Britain froze all Japanese assets.

26 **Pres. Roosevelt** placed armed forces of Philippines under U.S. command; Japan froze U.S. and British assets; U.S. defense agencies froze all stocks of raw silks; Great Britain gave notice of its intention to terminate British-Japanese-Indian-Burman trade treaties.

27 **All possible U.S. aid** to U.S.S.R. was pledged by Harry Hopkins, lend-lease coordinator, in a broadcast from London.

28 **Dutch East Indies** suspended oil agreement with Japan in a general order freezing all Japanese assets.

29 **Nazi forces** in the Smolensk area were dislodged by counterattacking Russian units, the red army claimed.

30 **Pres. Roosevelt** asked congress for authority to establish ceilings on living costs to avert inflation.

U.S.S.R. and Polish government-in-exile signed agreement ending state of war between the two countries; U.S.S.R. agreed to recognize the Polish frontiers prior to the soviet-nazi pact of Sept. 1939.

Washington protested to Tokyo over the bombing of an American gunboat, "Tutuila," at Chungking, China.

31 **Japan's prompt apology** for the bombing of the "Tutuila" was accepted by the U.S.

Pres. Roosevelt created an economic defense board and named Vice-President Henry Wallace to head the new agency.

The R.A.F., in the first direct military support given by Britain to Russia, attacked the Finnish port of Petsamo and the nazi-held port of Kirkenes in Norway.

AUGUST

1 **Pres. Roosevelt** banned export of aviation gasoline and oil to all points outside the western hemisphere, excepting the British empire and "countries resisting aggression."

OPM ordered immediate stoppage of all raw silk processing by nondefense industries.

2 **Undersec'y of State Welles** assailed Vichy's cession of Indo-China bases to Tokyo.

U.S. ordered rationing of rayon yarn to avert complete dislocation of silk mills employing some 175,000 workers.

3 **Voluntary curfew on gasoline sales** from 7 p.m. to 7 a.m. went into effect in 13 eastern states.

4 **Tax bill** of $3,206,200,000 was voted, 369 to 40, by the U.S. house of representatives.

5 **Germans** claimed to have widened the Smolensk gap in their drive on Moscow; Russians reported the halting of twin nazi drives on Kiev.

6 **German high command** claimed capture of 895,000 prisoners in the Russian campaign and estimated soviet casualties at 3,000,000 dead and wounded.

16,000 workers went on strike at shipyard in Kearny, N.J., halting work on defense contracts totalling about $450,000,000.

7 **Bill to extend army service** to 30 months passed in U.S. senate by 45 to 30 vote.

Soviet information bureau put German casualties since the beginning of the Russian campaign at 1,500,000, while estimating Russian losses at 600,000.

8 **Twenty-five soviet divisions** were trapped in a nazi pincer movement in the Ukraine, according to a German high command claim; Moscow admitted withdrawal of troops in the Ukraine area and said Berlin was twice raided by the red air force; Vichy military observers estimated nazi losses at 1,500,000 and Russian losses at 2,000,000 in the first 48 days of warfare on the Russian front.

9 **Germans hurled large masses** of men and material in a new attack on all three major fronts of the Russian theatre of war.

Steel was placed under full OPM control.

11 **Russian armies** defending the Odessa and Krivoi Rog sectors in the Ukraine area were reported perilled by a German "pocket" movement.

Pres. Roosevelt ordered the federal reserve board to place a curb on instalment-credit purchasing.

George Browne and Willie Bioff, who won control of A.F. of L. stage union, were found guilty by federal court in New York city of violating anti-racketeering statute.

U.S. cruiser seized "Odenwald," axis raider disguised as U.S. merchant ship, in Atlantic equatorial waters, navy announced.

7 **After 11 days of bitter debate,** U.S. senate voted 50 to 37 to amend Neutrality act to permit arming of U.S. merchantmen and entrance of U.S. ships into war zones.

Russians launched counter-offensive from Kalinin to Volokolamsk.

8 **German warships would fire on U.S. vessels** only if attacked, Adolf Hitler declared in speech marking 18th year of Munich beerhall putsch.

9 **Destruction of 11 Italian merchantmen** in Mediterranean by British naval squadron was announced by admiralty in London.

Nazi authorities announced 20 Czechs had been executed for attempting to disrupt Vienna's food supply organization.

10 **Churchill pledged U.S.** that Britain would declare war on Japan "within the hour" if Japan and U.S. should go to war.

National Mediation Defense board rejected C.I.O. demand for closed shop in captive coal mines.

U.S. navy department ordered commandant at San Diego area to proceed with work on naval construction despite strike of building trade workers.

11 **Finland rejected U.S. request** to stop fighting against U.S.S.R.

Manuel Quezon was re-elected president of the Philippines by estimated 7-to-1 margin over his nearest opponent.

12 **Executives** of "Big Five" operating railroad brotherhoods set Dec. 7 as date of scheduled strike.

Churchill told house of commons Battle of Atlantic was turning in Britain's favour.

13 **House of representatives** voted 212 to 194 to amend Neutrality act.

Counterattacking Russian troops made new gains in Tula sector; nazi forces reported capturing coast positions south of Kerch in Crimea.

14 **"Ark Royal,"** 22,500-ton British aircraft carrier, was torpedoed and sunk by axis submarine about 25 mi. east of Gibraltar.

U.S. marines were ordered by Pres. Roosevelt to leave garrisons in Shanghai, Peiping and Tientsin.

15 **U.M.W.A. officials** ordered 53,000 miners in captive coal pits to cease work at midnight.

16 **C.I.O. national executive board** voted unanimously to back John L. Lewis and United Mine Workers' Union in strike for union shop in captive coal pits.

British Labour Minister Ernest Bevin declared 1,000,000 married women were needed for munitions work.

17 **Japanese Premier Hideki Tojo** set as terms for peace in Pacific: hands off China, lifting of economic blockade against Japan and end of military encirclement.

Pres. Roosevelt and Saburo Kurusu, special Japanese envoy, conferred on Pacific crisis.

Germans claimed capture of Kerch, key city in Crimea.

Hitler placed conquered areas of U.S.S.R. under civil administration of Alfred Rosenberg, chief nazi ideologist.

Some 53,000 miners in captive pits stopped work following collapse of negotiations.

Pres. Roosevelt asked congress for $7,082,419,046 in supplemental appropriations for armed forces and for defense housing.

Pres. Roosevelt signed law repealing Neutrality act.

18 **British forces** launched a surprise sea, air and land offensive into Libya, advancing 50 mi. in first 24 hr.; Lt. Gen. Sir Alan Gordon Cunningham led land forces, while his brother, Adm. Sir Arthur Browne Cunningham, commanded navy units.

C.I.O., in its fourth constitutional convention, unanimously endorsed foreign policy of Pres. Roosevelt.

Lt. Gen. Sir Alan Brooke was named to succeed Gen. Sir John G. Dill as chief of British imperial general staff; Lt. Gen. Bernard C. Paget was appointed commander in chief of home forces, the post vacated by Gen. Brooke.

Japan's special emissary Saburo Kurusu and Ambassador Kichisaburo Nomura asked Tokyo for further instructions after three-hour parley with Sec'y Hull.

Russians admitted situation was "grave" in Crimea as red army forces withdrew from Kerch.

U.S. and Mexico reached accord under which Washington agreed to stabilize peso, make silver purchases and finance Mexican road program, while Mexico agreed to make payments on U.S. claims and attempt settlement of oil dispute.

20 **British desert armies** captured Rezegh, 10 mi. south of besieged Tobruk.

Churchill told house of commons that goal of Libyan drive was to destroy axis armies.

Gen. Maxime Weygand "retired" as Vichy proconsul in Africa; Gen. Alphonse Juin was named head of French armies in North Africa and Gen. Jean Barrau chief of units in west Africa.

U.S. halted all economic aid to French North Africa on grounds that Weygand was ousted on express demand of Hitler.

21 **Eleven C.I.O. pickets** were shot and wounded in gun battle at a captive coal pit in Edenborn, Pa.

Sixth major offensive against Moscow in three weeks was halted at Volokolamsk and Tula.

22 **Anzac troops captured Fort Capuzzo,** Italian stronghold in Libya.

Berlin announced that German troops had captured Rostov.

John L. Lewis called off strike in captive coal mines and accepted Pres. Roosevelt's proposal for arbitration of union shop issue.

23 **Anzac forces recaptured Bardia** on Libyan coast while British and nazi tank armies engaged in battle at Rezegh.

Germany cut occupation cost levied against French by 100,000,000 francs daily.

U.S. consulate in Saigon, French Indo-China wrecked by bomb; none were injured.

OPM announced use of lead and tin foil for wrapping cigarettes, candy and similar products would be prohibited after March 15, 1942.

24 **U.S. sent troops to Dutch Guiana** under agreement reached with Netherlands government in London; Brazil

NOVEMBER—*Continued*

agreed to co-operate in military measures to protect Dutch Guiana.

U.S. would extend lend-lease aid to Free French movement, Gen. De Gaulle's delegation in Washington announced.

British reported capture of Gambut in Libya.

German forces reached point 31 mi. west of Moscow.

U.S. supreme court ruled as unconstitutional California anti-migrant law designed to check influx of "Okies" into that state.

25 British tank units in Libya recoiled under counter blows of Gen. Erwin Rommel's panzer divisions.

Pres. Roosevelt appointed William C. Bullitt as his special representative in near east.

Thirteen nations, including Finland, signed anti-comintern pact in Berlin.

26 Sec'y Hull submitted new proposals for readjustment of U.S.-Japanese relations to Nippon envoys Kurusu and Nomura.

German troops driving toward Stalinogorsk flanked Tula.

Axis forces captured 5,000 British soldiers, including two generals, in Libyan desert war, Rome dispatches said.

27 Pres. Roosevelt and Sec'y Hull conferred with Japanese envoys Kurusu and Nomura amid reports that Nipponese were massing troops in Indo-China.

Anzac troops joined forces with section of British garrison in Tobruk; New Zealanders recaptured Rezegh.

Argentina agreed to sell U.S. all its tungsten production for three-year period; Japan had previously bought 50% of Argentina's tungsten output.

George S. Messersmith appointed ambassador to Mexico.

German reinforcements and "volunteer" native units battled organized Serb guerrillas in Yugoslavia.

Italian garrison in Gondar, last Italian outpost in Abyssinia, surrendered to British after seven and one-half months' siege.

28 Bill providing for creation of five-man board to control prices was passed in house of representatives, 224 to 161.

Shanghai dispatches reported 70 troop transports were moving 30,000 Japanese troops southward.

Pres. Manuel Quezon asserted Philippines were unprepared for war.

Acting Pres. Ramón Castillo ordered Argentine police to ban 5,000 meetings throughout country scheduled by pro-British Acción Argentina.

29 Russians recaptured Rostov, routing Col. Gen. Paul von Kleist's armies.

Japanese Premier Hideki Tojo declared Anglo-American "exploitation" of Asiatic peoples must be "purged with a vengeance."

British submarines in Arctic sank eight nazi supply ships carrying troops and supplies to German armies in northern U.S.S.R. British admiralty said.

House military affairs committee announced plans to probe charges that "defense brokers" had secured millions in commissions on promises to obtain government contracts.

30 Japanese Foreign Minister Shigenori Togo rejected as "fantastic" U.S. proposals for settling far eastern crisis.

A state of emergency was decreed in Singapore and new reinforcements of British and Indian troops reached Rangoon, Burma.

Cairo dispatches said mechanized British patrols reached Gulf of Sidra after 300-mi. advance across Libyan desert.

DECEMBER

1 Pres. Roosevelt conferred with Adm. Stark and Sec'y Hull on Japanese crisis; Japanese Ambassador Nomura told press "there must be wise statesmanship to save the situation"; Tokyo decided to continue parleys after hearing report by Foreign Minister Togo.

Moscow dispatches said 102 German planes were destroyed and 118 tanks and 210 guns were captured from nazis in Rostov area.

Marshal Pétain and Marshal Goering met in St. Florentin in nazi occupied France.

Compromise wage agreement arranged by Pres. Roosevelt's fact-finding board averted threatened nation-wide railway strike of 1,200,000 workers.

2 Pres. Roosevelt asked Japan for explanation of movement of troops, planes and ships into French Indo-China.

British warship squadron, headed by battleship "Prince of Wales" and battle cruiser "Repulse," arrived at Singapore.

Prime Minister Churchill asked commons for authority to draft 3,000,000 more men into armed forces and to require women to join uniformed services.

Gen. Rommel's axis tank units seized Rezegh, Libya.

Russian forces in Donetz area pursued German units fleeing west along shore of Sea of Azov.

Sixty persons charged with plotting to assassinate Mussolini appeared before tribunal in Trieste.

3 House of Representatives passed anti-strike bill by vote of 252 to 136.

Pres. Roosevelt announced that he had authorized shipments of lend-lease supplies to Turkey.

4 Reuters dispatch said Vichy had agreed to grant Hitler naval and air bases in north Africa.

House of commons passed British conscription bill by vote of 326 to 10.

5 Japan told Pres. Roosevelt that reinforcements to Indo-China were only a precaution against Chinese troop movements along colony's northern border; official Tokyo spokesman said Washington parleys would continue and that both sides were sincere.

Russian armies in Don basin swept 11 mi. past Taganrog.

House of representatives passed by 309 to 5 vote defense appropriation bill, authorizing $8,243,839,031 to expand U.S. army to 2,000,000 men.

6 Russians began counter-offensive along entire Moscow front.

Pres. Roosevelt made personal peace appeal to Emperor Hirohito after hearing reports of heavy troop concentrations in Indo-China; Philippine cabinet asked all "non-essential" civilians to leave Manila and other danger zones.

Britain announced declaration of war on Finland, Hungary and Rumania.

U.S. ordered all Finnish ships in U.S. ports put under protective custody.

7 Striking without warning, Japanese naval and air forces attacked and severely damaged U.S. ships in Pearl Harbor naval base, Hawaii, and also attacked strategic points in Philippines and Guam; Nipponese planes bombed Hongkong and Singapore; Japanese troops landed in Malaya and moved on Thailand from French Indo-China; Japanese envoys were delivering Tokyo reply to U.S. note at time of attack on U.S. possessions; note rejected U.S. terms and said U.S. and Britain were "conspiring" against Japanese interests in Asia.

Netherlands government in exile in London declared war on Japan; Canada and Costa Rica also declared war.

Sec'y of Treasury Morgenthau impounded $131,000,000 in Japanese investments in U.S. and banned all trade dealings with Japan; FBI agents received orders to round up certain Japanese nationals in U.S.

Russian armies broke German line on Moscow front at two points and destroyed two divisions.

Pres. Roosevelt's 3-man arbitration board ruled that all workers in captive mines should be required to join C.I.O.

8 U.S. congress declared war on Japan after Pres. Roosevelt denounced Japanese aggression and "treachery" in address to joint session; senate voted 82 to 0 and house voted 388 to 1; Representative Jeanette Rankin (Rep., Mont.) was lone dissenter.

DECEMBER—*Continued*

Prime Minister Churchill declared war on Japan in speech before house of commons; China declared war against Germany, Italy and Japan, Foreign Minister Quo Tai-chi announced in Chungking; Free French government declared war against Japan, as did Honduras, San Salvador, Guatemala, Haiti and Dominican Republic.

Thailand capitulated to Japan, 18 hours after first attack; Singapore dispatches said British troops repulsed Japanese landing party in Malaya; Japanese planes raided Hongkong; Tokyo radio announced capture of Wake and Guam islands and said sinking of two U.S. battleships and damaging of four other capital ships in Hawaii had given Japanese naval mastery in Pacific.

San Francisco was blacked out after reports that enemy craft were sighted over city; other west coast cities and military bases were also blacked out.

Berlin spokesman admitted that winter had stopped German drive on Moscow and that capture of Russian capital was not expected before spring.

9 Pres. Roosevelt said U.S. had suffered serious reverses in Hawaii and told nation to expect long war.

False air raid alarms upset New Yorkers.

Japanese landed strong forces in Kota Bharu area of northern Malaya; British armies in Hongkong checked a Nipponese landing party.

Cuban congress voted to declare war on Japan; Nicaraguan congress approved declaration of war on Japan; Brazil froze axis funds; Argentina and Chile granted U.S. special status as "nonbelligerent."

Washington agreed to give transit over U.S. territory to Mexican troops sent to protect Lower California.

Russian armies recaptured Tikhvin on Leningrad front, reopening road to Moscow.

The pictures on this page are, left to right:

LITVINOV	**Dec. 13**
NIMITZ	**Dec. 17**
KIMMEL	**Dec. 17**
MacARTHUR	**Dec. 19**
GOEBBELS	**Dec. 20**

10 Japanese torpedo planes sank 35,000-ton battleship "Prince of Wales," and 32,000-ton battle cruiser "Repulse" off Malaya; more than 2,000 survivors were rescued from both ships; 595 were listed as missing.

Japanese forces approached Kota Bharu, important Malayan air base 350 mi. north of Singapore; British declared two Japanese attacks on Hongkong had been repulsed; Japs landed strong forces on northern Luzon coast while air raiders launched heavy attacks on Cavite naval base near Manila; U.S. planes were reported to have bombed three Japanese transports, one of which capsized.

Los Angeles was blacked out for three hours.

Sec'y Hull urged Pan American union to convoke Latin American foreign ministers for parley on hemisphere defense in Rio de Janeiro early in 1942; Chile and Argentina opened negotiations to permit Chile to fortify Strait of Magellan.

Soviet troops captured more towns in Orel sector.

British armies in Libya completely freed Tobruk garrison and captured Gambut.

11 Germany and Italy declared war on U.S. and signed new pact with Japan to preclude separate peace; U.S. congress declared war on Germany and Italy; senate vote was 88 to 0 for war against reich and 90 to 0 for war against Italy; house vote was 393 to 0 against Germany and 399 to 0 against Italy; both houses of congress removed restrictions against use of U.S. troops outside western hemisphere.

Mexico broke off relations with Germany and Italy; Cuba, Costa Rica, Nicaragua, Guatemala and Dominican Republic declared war on Germany and Italy.

Filipino army division repulsed Jap units 150 mi. north of Manila; U.S. navy communiqué announced U.S. fliers had sunk a Japanese battleship of 29,300-ton Kongo class, a cruiser and destroyer in Pacific action; a second Japanese battleship was reported damaged.

Sec'y of Navy Knox arrived in Honolulu for inspection tour.

Axis hopes of separate peace with U.S.S.R. were vain, soviet radio broadcast said.

12 U.S. forces battled Japanese invaders on three sides of Luzon island; Japanese strengthened their landing forces at Aparri and Vigan and landed troops off Zambales province and at Legaspi; small U.S. garrisons still held Wake and Midway islands.

British withdrew from advanced positions in Hongkong; Japanese said their troops had captured Kowloon; Chinese troops attacked all along Kwangtung front to relieve Japanese pressure on Hongkong; withdrawals in Malaya near Thai border acknowledged by Britain.

U.S. Senate voted $10,572,350,705 defense bill to strengthen army and navy air forces.

U.S. seized 83,000-ton liner "Normandie" and 13 other French ships.

13 U.S. armies recaptured Lingayen beach-head in Philippines and wiped out Japanese invasion force; Netherlands navy announced its submarines had sunk four Jap troop transports off Thailand; British admitted withdrawing to new positions in Kedah in Malaya.

Premier Hideki Tojo cautioned Japan against over-optimism and warned of long, hard war.

U.S. seized 20,000-ton Swedish liner "Kungsholm" under right of angary.

Gen. von Stuelpnagel, commander of nazi forces in France, ordered immediate execution of 100 French hostages.

Allied destroyers in Mediterranean sank two Italian cruisers while a British submarine sank a third cruiser, British admiralty announced.

U.S.S.R. would concentrate all efforts toward smashing Hitler's armies and did not envisage opening second front against Japan, Ambassador Maxim Litvinov told U.S. press.

Red Army troops captured Volkhov on Leningrad front.

14 U.S. bombers sank four Japanese troopships and damaged five others off northern Luzon; U.S. marines on Wake island repulsed new Japanese attacks; Hongkong rejected an ultimatum to surrender.

Turkey told U.S. she would remain neutral in new conflict; Premier Eamon De Valera reaffirmed Eire's neutrality.

15 Sec'y Knox revealed that 32,600-ton battleship "Arizona," three destroyers, a minelayer and target ship had been sunk in Japanese attack on Pearl Harbor, Dec. 7; he also said battleship "Oklahoma" was capsized but could be repaired; navy casualties in attack were 91 officers and 2,638 men killed; army casualties were 168 men and officers; Knox said Hawaii defense forces were "not on the alert," but that Japan had failed in its objective to destroy U.S. naval supremacy.

Pres. Roosevelt accused Emperor Hirohito of personal complicity in Japan's treacherous attack on U.S.

Japanese mechanized armies entered southern Kedah in Malaya; British garrison in Hongkong dug in behind barricades.

Moscow reported recapture of Klin, and announced new victories on all Russian fronts.

Both houses of congress voted bill calling for $10,077,077,005 in emergency war appropriations.

16 Filipino army division held Lingayen beach after 72-hour battle.

Japanese submarine shelled port of Kahului on island of Maui, 100 mi. southeast of Honolulu.

British command in Hongkong admitted evacuating mainland section on night of Dec. 11-12.

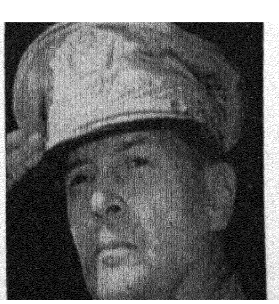
Both houses of congress adopted bills granting Pres. Roosevelt virtually unlimited war powers.

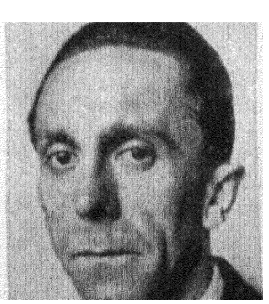
Pres. Roosevelt appointed Byron Price director of U.S. censorship.

Russian troops recaptured Kalinin, Petrovsk and Volovo; Moscow said 9th German army corps had been destroyed.

Argentina proclaimed state of siege to "fulfil international pledges" and maintain order.

17 Japanese invaders in northern Luzon were repelled; U.S. air squadrons destroyed 26 Japanese planes at Vigan.





DECEMBER—*Continued*

U.S. commanders of army, navy and air forces in Hawaii were ousted; Rear Adm. Chester W. Nimitz was named commander-in-chief of Pacific fleet, relieving Adm. Husband E. Kimmel; Lt. Gen. Delos C. Emmons was assigned to command the Hawaiian department, relieving Lt. Gen. Walter C. Short; Brig. Gen. Clarence L. Tinker was assigned to command Hawaiian air forces, relieving Maj. Gen. Frederick L. Martin.

British forces blew up oil wells and refineries in British Borneo as Japanese units made successful landing; Japanese troops in Malaya were reported in province of Wellesley; two Chinese armies continued drive to ease Japanese siege at Hongkong.

Soviet armies between Lake Onega and Murmansk launched new drive on Finnish and German armies.

18 Tokyo communiqué said Japanese force had landed on island of Hongkong; Netherlands and Australian forces occupied Portuguese section of Timor; British admitted Penang, island base off Malayan coast, had been cut off by Japanese; Australian planes bombed Japanese island in Caroline group.

U.S. reached naval agreement with French authorities of Martinique.

British armies broke axis lines west of El Gazala in Libya.

19 Thirty Japanese planes bombed port of Iloilo on Philippine island of Panay; Lt. Gen. Douglas MacArthur, commander of Philippine military forces, was raised to rank of full general; Portuguese Premier Salazar demanded evacuation of Timor island by Allied force; British garrisons withdrew from Penang.

House and senate voted bill to set draft age at 20 to 44 inclusive.

British motorized forces occupied Derna airport in Libya.

Russian troops recaptured Ruza and a score of other towns in central front drive.

Spain announced "nonbelligerent" status in Pacific war.

20 Japanese troops landed at Davao on Mindanao island, 600 mi. south of Manila, and engaged U. S. forces.

Enemy submarines off west coast attacked two U.S. tankers; navy reported axis U-boats were also operating off Atlantic coast.

British forces in Malaya organized new line south of Krian river, 300 mi. above Singapore.

Adm. Ernest J. King was named commander-in-chief of U.S. fleet; Rear Adm. Royal E. Ingersoll was named commander of Atlantic fleet, post vacated by Adm. King.

Russian armies recaptured Volokolamsk.

British force occupied Derna as two other armies pursued axis units in Libya.

Goebbels appealed to German people to donate warm clothing for nazi armies on Russian front; he read message from Hitler who admitted nazis were fighting "enemy superior in men and materials."

21 U.S. naval forces had probably sunk or damaged 14 enemy submarines in Atlantic, Sec'y Knox announced; 32 survivors of U.S. tanker "Emidio" were rescued after their ship was torpedoed 20 mi. off Pacific coast.

Adolf Hitler removed Field Marshal Walther von Brauchitsch as commander-in-chief of German army and assumed post himself.

Axis armies retreated in Libya as British periled Bengasi.

22 Prime Minister Churchill made secret trip to Washington to confer with Pres. Roosevelt.

U.S. and Filipino armies battled heavy Japanese force landed in Lingayen area from 80 Japanese transports carrying estimated 80,000 to 100,000 troops.

U.S. senate voted to increase navy enlisted personnel from 300,000 to 500,000, and marine corps enlistments from 60,000 to 104,000; Pres. Roosevelt signed amended selective service bill.

Marshal Klimenti Voroshilov was assigned to command red army in Eastern Asia.

Wake Island occupied by Japanese after 14-day resistance by garrison of 385 U.S. marines.

23 Pres. Roosevelt disclosed that he and British Prime Minister Churchill were conferring on plans for definite unity of action in Pacific; anti-axis war plans should be based upon defeating Germany not by anticipation of internal collapse but by external military blows, Churchill declared in dual press conference with Pres. Roosevelt at White House.

Batavia dispatches said Netherlands submarine sank three Japanese transports and tanker; three more U.S. ships were attacked, one was sunk off California coast.

Generalissimo Chiang Kai-shek named T. V. Soong Chinese foreign minister to replace Dr. Quo Tai-chi.

24 Free French naval force commanded by Vice-Admiral Emile Muselier occupied Vichy-governed islands of St. Pierre and Miquelon.

New Japanese landing near Atimonan on Luzon's east coast was announced by U.S. army headquarters in Philippines; British batteries shelled Japanese forces attacking on Malayan coast 300 mi. north of Singapore.

Pope Pius XII, in annual Christmas message, broadcast five-point peace program, and condemned anti-Christian movements, aggression, oppression of minorities and small countries, and economic slavery of nations.

British troops in Libya took Barce and Benina, advancing to within 12 mi. of Bengasi.

25 British garrison at Hongkong surrendered to Japanese after 16-day siege; sinking of an enemy submarine by an army bomber off California announced by U.S. army communiqué.

Ninety-eight per cent of St. Pierre's male population voted for Free French rule in plebiscite; U.S. state department assailed Free French occupation of St. Pierre and Miquelon and asked Canada what steps she would take to restore status quo.

British armies captured Bengasi.

26 Gen. MacArthur declared Manila an "open city" to spare it from air or ground attack; Jap tank units struck heavily at Lamon bay; Nipponese spearhead reached Binangonan, 110 mi. north of Manila; British admitted Japanese "patrol activity" north of Kenaman on Malayan east coast only 175 mi. north of Singapore; Air Chief Marshal Sir Robert Brooke-Popham was relieved of British far east high command and replaced by Lt. Gen. Sir Henry Pownall.

U.S. Maj. Gen. George Brett, British Gen. Sir Archibald Wavell and Chinese Generalissimo Chiang Kai-shek created an "ABC" (American-British-China) war council in Chungking.

Addressing joint session of U.S. congress, British Prime Minister Churchill declared that anti-axis forces would probably launch victory drive in 1943.

OPA Administrator Leon Henderson placed new tires under permanent rationing program.

27 Japanese planes launched heavy air attack on "open city" of Manila; Nipponese troops steadily advanced on Manila from both north and south.

Russian forces advanced on wide sweep along Oka river and captured Likhvin, rail juncture 30 mi. south of Kaluga.

British "commando" units staged raids on Vaagsoe and Maaloy islands off Norwegian coast, admiralty announced.

28 Pres. Roosevelt assured Philippines that their freedom would be redeemed, as U.S. navy promised "positive assistance" to hard-pressed islands; undefended Manila was bombed anew by Japanese planes; Nipponese armies intensified drive about 45 mi. north of Manila; Tokyo war office spokesman said Japanese armies refused to be bound by U.S. "arbitrary and unilateral" announcement of Manila as open city; Netherlands armies battled Japanese parachute troops in Dutch Sumatra near the Medan airport.

London revealed that Foreign Secretary Anthony Eden was in Moscow.

29 Gen. MacArthur shortened his lines as Japs continued drives on Manila bay; Nipponese forced spearhead through Ipoh, Malaya, and advanced to Kuantan on east coast.

30 Russian forces, covered by soviet Black sea fleet, captured Kerch and Theodosia; Russian armies on central front also recaptured Kaluga.

$50,000,000,000 yearly, half U.S. national income, would be expended for war production, Pres. Roosevelt announced.

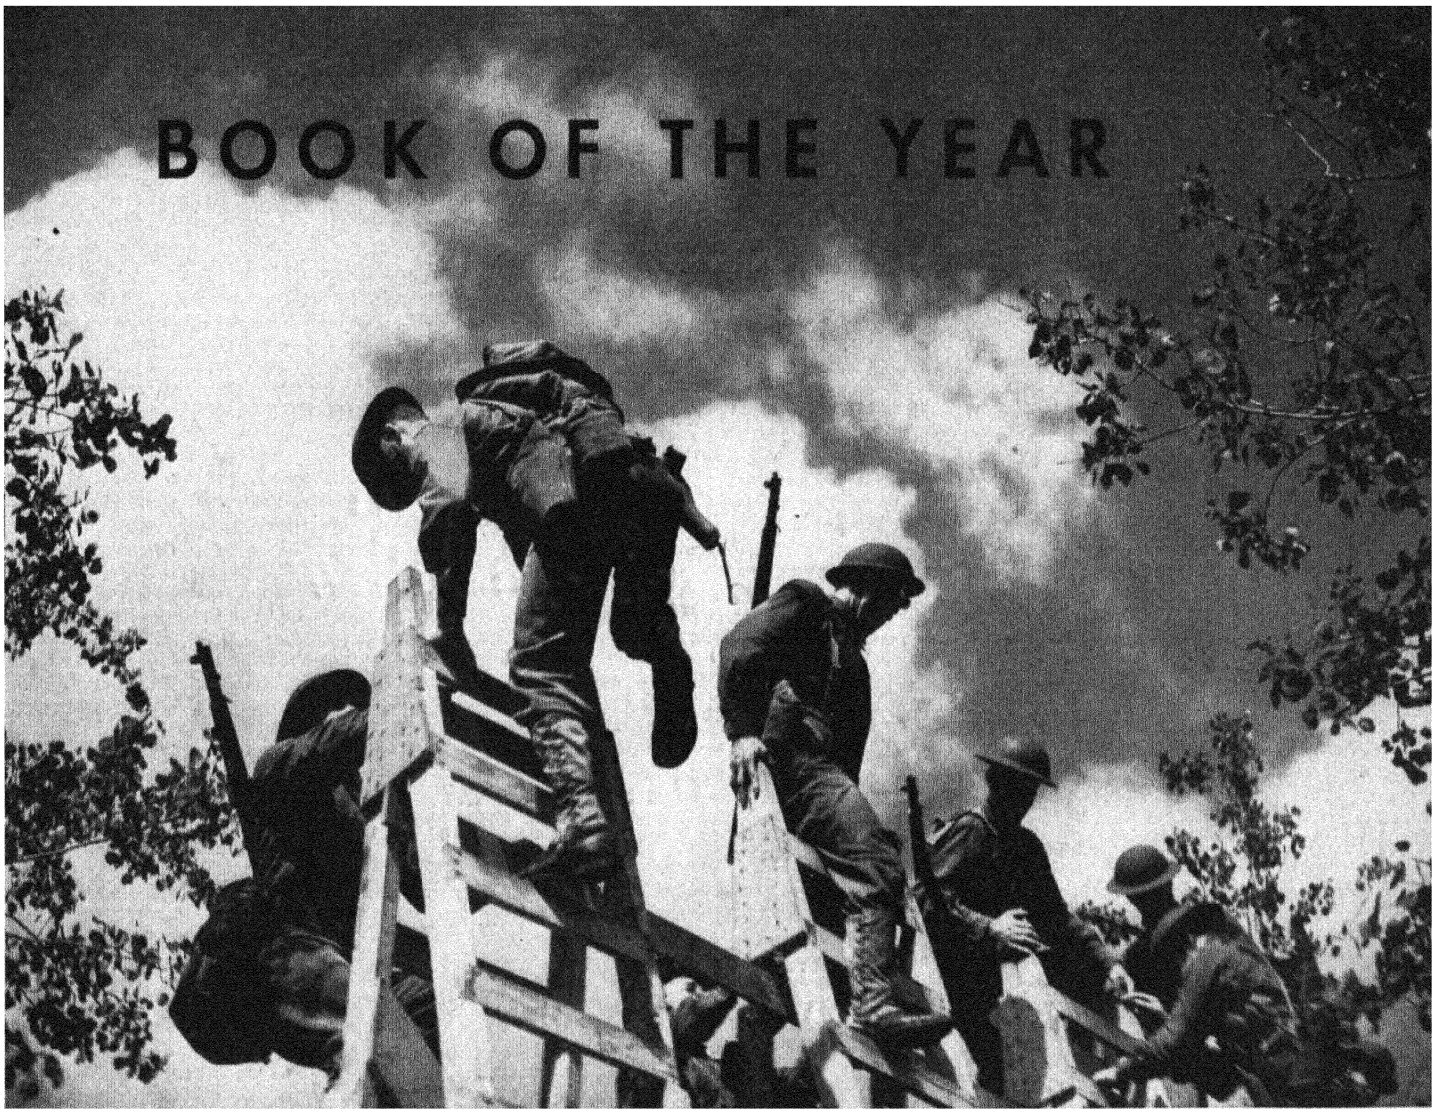
Churchill addressed Canadian parliament in Ottawa on Allied plans to defeat axis powers.

Charles A. Lindbergh offered his services to U.S. army air forces.

Mohandas K. Gandhi quit leadership of All-India National congress party because it abandoned civil disobedience policy.

31 Tokyo dispatches said Nipponese troops reached lines 20 mi. from Manila.

Hitler, in New Year's message, warned German people of hard fighting ahead in 1942.



AAA: *see* AGRICULTURE.

Abrasives. The changing requirements resulting from the development of the automotive industry have led to marked expansion in the production, use and varieties of abrasives, and the increased industrial activity incident to the defense program has been responsible for increased demand for certain types of abrasives, especially the artificial types and some of the high-grade natural varieties. The table on p. 18 lists the production of the various types of abrasives in the United States from 1937–40.

Corundum.—The United States has no domestic production of corundum, a natural oxide of aluminum, but depends entirely on imports, mainly from South Africa, which furnishes the bulk of the world supply. United States imports, usually of the order of 2,000–4,000 tons annually, were 2,609 long tons in 1940. South African sales rose from 2,625 short tons in 1939 to 4,211 tons in 1940, of which 3,375 tons went to the United States and 836 tons to Great Britain.

Diamonds.—A large share of the world's diamond output is used for abrasive work, but little definite information is available outside of the United States imports, which have more than doubled since 1937, and have increased more than twentyfold since 1930. This phenomenal growth in demand was due partly to the use of diamond-pointed tools for many types of fine machine work, and partly to the growing use of special types of high-speed machine tools, such as tungsten carbide, which require a bonded diamond wheel for dressing. Since this type of work was largely centred in the automobile and aeroplane industries, the defense program resulted in an increased demand for diamond abrasives. United States imports were mainly under the classification of glaziers', engravers' and miners' diamonds, but there were in addition small imports under the heading of bort and of diamond dust. The 1940 imports included 3,809,071 carats valued at $11,026,563 under the first heading, 785 carats of bort valued at $19,660, and diamond dust valued at $2,515, and 1941 was expected to show a further increase. (*See* also DIAMONDS.)

Emery.—In addition to the output reported in the table the United States imports emery from Turkey and Greece, the two chief sources of world supply, each of which produces 10,000–15,000 tons annually. Imports vary widely from year to year, being 426 long tons in 1938, 1,956 long tons in 1939 and 5,105 long tons in 1940.

Flint.—Imports of silex for liners and flint pebbles for medium grinding in ball mills were cut off by the German occupation of Belgium, Denmark and France, the former sources of supply, and the shortage was being supplied from domestic sources and by substitutes. Production was reported from Jasper, Minn., Lilesville, N.C., Carlsbad, Calif., Iron City, Tenn., Salisbury, N.C., and Los Angeles, Calif., as well as from Gouverneur and Knollys, Sask., and from beach deposits in Newfoundland. Substitutes being tried included topaz, granite blocks, corundum pebbles, balls of porcelain and of compressed silica flour with a sodium silicate binder, and lumps of the same material being ground.

Garnet.—There was little production of garnet outside of the United States, although there was some in Spain, South Africa and Sweden. The United States output comes from the Adirondack regions of New York and New Hampshire.

Grindstones, Millstones and Pulpstones.—Little information was available on these products aside from the production data in

United States Production of Abrasives
(In short tons, or as indicated)

	1937	1938	1939	1940
Aluminous Abrasives

[1]Imports; no domestic production. [2]Includes Canada also.

the table, except that the output was supplemented to a minor degree by imports.

Pumice.—In addition to the production of pumice and pumicite reported in the table, U.S. imports of crude material in 1939 were 6,656 short tons, decreasing to 3,758 tons in 1940; imports of manufactures were valued at $29,221 in 1939 and $6,468 in 1940.

Rottenstone.—Produced only in Pennsylvania, and used as a base in polishing compounds, the output of rottenstone is included with that of tripoli.

Sharpening Stones.—The output of sharpening stones shown in the table, including whetstones, oilstones and hones, was supplemented by small amounts of imports.

Sand and Sandstone.—Included in the outputs reported in the article SAND AND GRAVEL, and under *Sandstone* in the article STONE, there were material outputs of ground sand and sandstone, used largely for abrasive purposes, as well as of abrasive sand. About one-quarter of the ground sand and sandstone reported in the table is used in abrasives, while the abrasive sand is used in sand blasting, grinding glass, the manufacture of sandpaper, and other types of abrasive use.

Tripoli.—The output of tripoli reported in the table included also that of rottenstone, a product closely related in both character and uses. Demand in the United States is satisfied almost entirely from domestic sources, imports amounting to about 1% of production.

Artificial Abrasives.—For comparison with the demand for natural abrasives, the output of the chief types of artificial abrasives in the United States and Canada is reported in the table. (G. A. Ro.)

Accidents. The 1941 accident toll in the United States was: killed, 101,500; injured, 9,300,000; the cost, $3,750,000,000.

Huge as it was, the 1941 toll was not the highest on record. In 1936 there were 110,052 deaths, or 8% more than in 1941. The year 1937 also topped 1941. The 1941 death rate per 100,000 population was 76·2. Only 11 of the 40 years up to 1941 had lower rates. The lowest rate was 68·3 in 1921.

The 1941 accidental death totals for the U.S., by classifications, were:

	1941	1940	Change
All accidents*	101,500	96,885	+ 5%
Motor vehicle	40,000	34,501	+16%
Home	32,000	33,000	— 3%
Occupational	18,000	17,000	+ 6%
Public (not motor vehicle)	14,500	15,000	— 3%

*The all-accident totals are approximately the sums of the other figures, minus the duplication of occupational and motor vehicle deaths. This duplication in 1941 amounted to about 3,000. The 1940 all-accident and motor vehicle totals are U. S. Census Bureau figures. All others are National Safety Council estimates.

Increased activity in all fields—largely attributable to the ever-increasing tempo of national defense—was the key to the greater accident toll. Against a backdrop of the nation's pressing need for man power, these facts stood out sharply:

1. The 1941 accident toll among men in the expanded selective service age bracket (20 to 45) was 26,000—equal to the destruction of almost two full army divisions.

2. Approximately 18,000 workers were killed by occupational accidents. An additional 29,000 were killed in off-the-job accidents. This loss of manpower represented labour sufficient to build 20 battleships, 200 destroyers and 7,000 heavy bombers.

Accidents were the fifth most important cause of death in 1941, exceeded only by heart disease, cancer, cerebral haemorrhage and nephritis. One out of every 14 persons in the United States suffered a disabling injury during the year.

The traffic toll of 40,000 was an all-time high. Since traffic deaths went up 16% and travel increased only 11%, the mileage death rate rose 4%. In industry, however, the 6% increase in deaths was far less than the 17% rise in employment in manufacturing industries and the 9% gain in total nonagricultural employment.

The estimated economic loss of $3,750,000,000 covers both fatal and nonfatal accidents and includes wage losses, medical expense, the overhead costs of insurance, and property damage from motor vehicle accidents and fires. There were other large but less tangible losses, such as interruption of industrial production, which cannot be estimated.

Persons 65 years and older were the only group with a better accident record in 1941 than in 1940. Deaths dropped 1% to 27,650. The school child group (5 to 14 years) had a 10% increase, with deaths totalling 7,100. This increase was exceeded only by the 12% rise shown for the 15–24 year group, where deaths totalled 14,250. The 25–64 year group accounted for 45,350 fatalities—a 5% rise. There were 7,150 deaths of children under five years of age, a 4% increase.

Deaths from falls were about the same in 1941 as in 1940—approximately 26,000 each year. Falls are second only to motor vehicle accidents as a cause of accidental death.

Deaths from burns were approximately 6,900 in 1941—a 5% drop from 1940. Drownings increased about 2% to 7,000.

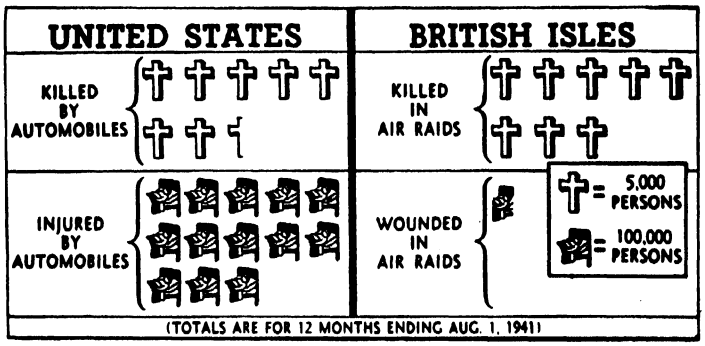
The year 1941 was the first in ten years in which no catastrophe took as many as 100 lives. A Brooklyn, N.Y., ship and pier fire took 37 lives. A picnic boat explosion in Maine killed 36. The number of accidents in which five or more persons were killed was higher, however, than in 1940. This was largely because of multiple-death motor vehicle, military aviation and water transportation accidents, according to Metropolitan Life Insurance company reports. As in other years, nearly all accidents were one-or-two death cases.

The year 1941 can be characterized as a year of mobilization of accident prevention resources. Motivated by the rising accident tolls, President Roosevelt on Aug. 18 designated the National Safety council to lead an all-out attack on accident hazards in every field of activity, but with special attention to accidents involving workers since they constituted an indirect sabotage of the defense production program.

The National Committee for the Conservation of Man Power in Defense Industries, sponsored by the U.S. department of labor, was effective in developing an awareness of accidents, and a determination that they could be prevented, in many branches of industry hitherto unreached by safety materials. (*See* also DEATH STATISTICS; DISASTERS.) (W. H. CAM.)

Traffic Accidents.—The total of 40,000 deaths in 1941 was 5,500 more than in 1940. The death rate on a population base showed an increase of 14.9%. During 1941, 30 persons were killed for every 100,000 population and 12.6 persons lost their lives for each 100,000,000 motor vehicle miles travelled.

While the 16% rise in traffic deaths is attributed in part to an 11% increase in travel, a contributing factor was the 5% increase in the total number of motor vehicles in use. Other contributing factors included the in-



AIR-RAID CASUALTIES of the first full year of German raids on the British Isles, compared with motor traffic casualties in the U.S. during the same period

creased tempo resulting from the national emergency, the loss of trained enforcement personnel to selective service and the conscripting of many experienced professional drivers to military service.

Outstanding achievements in the field for 1941 may be summarized under the headings of the model highway safety program which was developed and endorsed by 12 leading organizations interested in safety in the United States.

Legislation.—Adoption by three additional states (Florida, Utah and Ohio) of the uniform act regulating traffic on highways as drafted by the National Conference on Street and Highway Safety; continued adoption by cities of the model municipal traffic ordinance; passage of bills in a majority of states increasing size of state police agency; passage of acts in two additional states (New York and Oregon) providing for use of evidence obtained through scientific tests for intoxication; speed limits increased early in the year by several state legislatures, but toward the end of the year the trend was reversed as a means of tire and motor vehicle conservation. Several states began the consideration of bills for the control of traffic during blackouts and air raids.

Motor Vehicle Administration.—Establishment by the American Association of Motor Vehicle Administrators and the National Safety council of a joint project for driver improvement through suspension and revocation of drivers' licences.

Enforcement.—Study and development of emergency measures for the control of traffic during possible wartime disaster; stepped-up enforcement to relieve accidents and congestion resulting from increased use of motor vehicles for defense and production purposes; inauguration of the nationwide emergency traffic law enforcement program by the International Association of Chiefs of Police and 11 other national organizations.

Education.—Academic credit courses in safety education conducted in 82 colleges and universities in 33 states during the summer of 1940; courses in driver training offered in approximately 8,000 high schools, 400 of which supplemented classroom work with actual road lessons; inclusion of 300,000 children in grade school safety patrols in 3,500 cities and towns; enlistment by two states of parental co-operation in training student drivers.

Engineering.—Departments established in an increased number of cities and states for the planning of traffic facilities, safeguards and regulations.

Training Personnel.—Inauguration of emergency training courses for police in wartime traffic control; continued increase in the training of traffic safety engineers, educators and enforcement personnel; continued co-operation of colleges and universities in conducting traffic officers' training schools. Principal training agency for educators was the New York University Center for Safety Education; for traffic police, the Northwestern University Traffic institute; for engineers, the Yale University Bureau for Street Traffic Research.

Aden. Aden is a British colony, seaport and territory in Arabia, situated in 12° 45′ N. and 45° 4′ E., including Perim island, etc., in the strait of Bab-el-Mandeb between Africa and Arabia.

Area 80 sq.mi.; pop. (est. 1939) 48,338. Aden protectorate, including Sokotra on the Red sea coast, 112,000 sq.mi.; pop. (est.) 600,000. Governor: Sir J. Hathorn Hall. Language: English and Arabic; religion: Mohammedan.

History.—The collapse of Italian operations in northeast Africa early in 1941 removed from Aden the threat of air raids and, allowing for war conditions, the colony and protectorate enjoyed a comparatively normal year. From the beginning of the war to Dec. 1941, Aden had made war contributions totalling £95,000,528, of which £61,000,900 were contributed in 1941, a particularly generous response in view of the small population. Of the total, £50,000 represented repayment of a government loan, while £45,000 consisted of gifts and contributions to the general war effort. Subscriptions for aircraft, mobile canteens, etc., amounted to £30,000.

In the late summer the chief secretary paid a visit to the king of the Yemen, and the governor represented Aden on the middle east war council set up under the chairmanship of the minister of state, Oliver Lyttelton. Aden was also represented at the conference of the middle east supply centre which opened in Cairo in November.

During the war an Arab chief in the protectorate, the Fadhli Sultan of Shuqra, was deposed for misgovernment and oppressive rule, and was succeeded by a cousin elected by the tribe.

(D. A. C.)

Finance.—Revenue (1938–39) £148,586; expenditure (1938–39) £127,963; currency, legal tender: rupee (Rs.1)=1*s.* 6*d.*=30.3 U.S. cents.

Trade and Communication.—External trade 1938 (merchandise and treasure on private account): imports, by sea, Rs.6,78,60,400; by land Rs.29,40,602; exports, by sea Rs.3,41,45,281; by land Rs.15,95,929; (treasure) imports Rs.1,23,69,439; exports Rs.72,50,784. Communication: shipping (1938), 2,079 merchant vessels (1,361 British) entered, total tonnage 8,650,411 net tons; motor vehicles registered (Sept. 30, 1939), 733 cars and taxis, 207 commercial vehicles.

Production.—(1938–39) Tobacco (approx. value of crop) Rs.500,000; salt 282,994 tons; (export) 248,784 tons; coffee (export) 4,900 metric tons.

Adler, Guido (1855–1941), Austrian author and professor of music, was born in Eibenschuetz, Moravia, then part of Austria-Hungary, on Nov. 1. A professor of musical science at the University of Vienna, Adler in 1894 undertook the editing of the *Denkmäler der Tonkunst in Österreich,* a publication of Austrian musical works, which in 1941 was in its 90th volume. He was the author of books on Richard Wagner and Franz Joseph Haydn, and while at the University of Vienna founded an institution for musical history. Adler died in Vienna in February.

Adult Education: *see* EDUCATION.

Advertising. The lend-lease program, priorities and finally entrance of the United States into World War II were the dominating factors in business and, consequently, in advertising in 1941. Priorities and shortage of certain materials, particularly metals, began to affect certain classes of goods. Continuance of the war kept advertising activity in the United Kingdom at about half its normal level. Advertising rates rose to offset in part the smaller volume. In the United States, advertising expenditures were $1,736,000,000 in 1941, an increase of 4·6%. Newspaper linage increased 3·8%; radio, 11·0%; magazines, 3·3%; outdoor, 11·1%; farm papers, 0·5%. Direct mail advertising volume increased 5·8%. These estimates are based upon studies reported in *Printers' Ink.*

Governments used advertising on a larger scale than ever before for increasing enlistments in military service and for the sale of bonds. Great Britain and Canada sold bonds at the low selling cost of 1·5%. The U.S. treasury engaged an experienced advertising consultant for the defense bond campaign.

South America.—Considerable progress was made in the standardization of space rates. The rate situation had been rather chaotic. Although rate cards were published, they were regarded as the basis of energetic dickering which usually resulted in securing sizeable reductions by the more persuasive advertisers. This was no longer the case in 1941. Card rates held for all. The circulation of many papers in new industrial areas increased greatly. This resulted in the installation of high-speed presses and improved printing. There was no guarantee of circulation statements by publishers and there was no prospect of establishing independent audits of circulation. One peculiarity of the South American field was the supplying of radio talent by the station management without extra charge. In the United States, radio talent is specifically paid for by the advertiser.

Copy and Layout.—There was an increasing use of humour. In the past, humour had been handled cautiously and sparingly. This trend began in 1940 and continued with greater strength in 1941 in the growing use of humorous situations, the injection of humour into the strip continuity, and the use of already established comic personalities.

While defense and war had produced important effects, they had not, however, turned advertisers away from product selling. In a survey it was estimated that only 4% of advertisements were not built around product selling. The other 96% were directed definitely at selling goods and services. The 4% of advertisements tied in with war and defense fell into two groups. The first group consisted of advertisements which showed either a man in uniform using the product or a military scene in the background. The second group consisted of advertisements of companies devoted entirely to the making of war goods. These advertisements were usually institutional and described the contribution of the company to the defense effort. Some companies, although they had no goods to offer to the public, still advertised their products on the ground that they would be available as soon as the war was over.

The Federal Trade commission continued its surveillance of advertising, causing advertisers to be cautious in the use of product claims.

Radio.—Advertisers in the United States spent $107,500,000 for time on the three major networks in 1941, an increase of 11%. In addition they spent $35,000,000 on programs, an increase of 24%. This increase was due in part to some shifting from quiz programs, which are relatively inexpensive, to the more costly variety shows. News broadcasts greatly increased with the spread of the war, by means of listening posts in the U.S. and a large staff of correspondents throughout the world. Advertisers capitalized on this interest by increasing their commercial sponsorship of news. Stations and sponsors contributed generously of their time to the defense effort. The "Treasury Hour" was perhaps the most important one. It was estimated that stations on the average devoted 760 min. and 227 announcements to the defense effort in the month of July 1941 alone. With the entry of the United States into the conflict, most stations entered on a 24-hr. schedule and broadcast news every hour or half hour. Radio achieved its largest audience, estimated at 90,000,000 persons, with the broadcast of Pres. Roosevelt's address on Tuesday, Dec. 9. (*See* also RADIO.)

Newspapers.—Total circulation of daily and Sunday newspapers reached an all-time high of 41,500,000 copies, a gain of 2% over 1940. During the year, the *Chicago Sun* was founded. There was some increase in the use of colour in newspapers. (*See* also NEWSPAPERS AND MAGAZINES.)

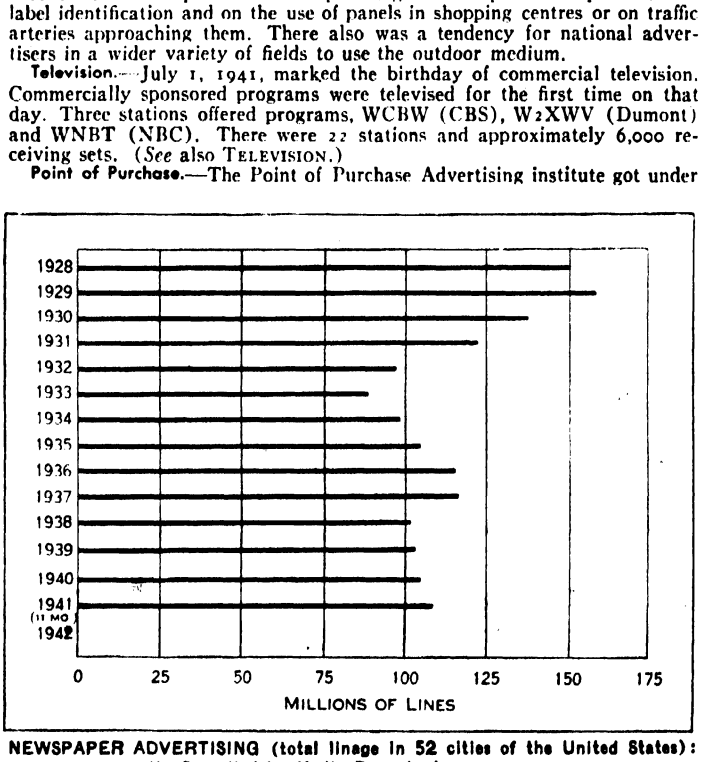
Magazines.—Twenty-one leading magazines issued a total of 1,103,000,000 net paid copies during the 12 months ending June 30, 1941, a gain of 5.5% over the corresponding 1940 period. Two or three magazines began to distribute their copies in substantial numbers by air express in South America.

Direct Mail.—There were no material changes in expenditure for direct mail, in number of advertisers using this medium, in postal regulations or in methods of mechanical reproduction. However, there was a reduction in novelty mailing pieces due, probably, to their greater cost. There was much publicity concerning the over-use of the congressional franking privilege, referred to in the press as the "franking fraud." It was alleged that congressmen condoned the use of their franking privilege by pressure groups of both American and foreign origin. Users of direct mail felt that it decreased the effectiveness of their own mailing pieces because of the competition for attention with franked propaganda.

Outdoor.—The year 1941 was marked by a practically complete standardization of structures and services. This was due partly to the Outdoor Advertising association and partly to the extension of the services of the Traffic Audit bureau which audited practically every outdoor plant in the United States triannually. Every panel was given a rating by the bureau and plant operators undertook to re-locate low-rated panels in places where they would receive higher ratings. With this standardization of ratings, the purchase of outdoor advertising circulation became comparable to the purchase of space and time in other major media. The growth of self-service merchandising, the increase in super-markets and the expanding use of open display in all types of retail outlets reduced or eliminated salesclerk influence on consumer purchases and placed greater emphasis on product and label identification and on the use of panels in shopping centres or on traffic arteries approaching them. There also was a tendency for national advertisers in a wider variety of fields to use the outdoor medium.

Television.—July 1, 1941, marked the birthday of commercial television. Commercially sponsored programs were televised for the first time on that day. Three stations offered programs, WCBW (CBS), W2XWV (Dumont) and WNBT (NBC). There were 22 stations and approximately 6,000 receiving sets. (*See* also TELEVISION.)

Point of Purchase.—The Point of Purchase Advertising institute got under way and endeavoured to provide information regarding this medium, to check on sales effectiveness of displays and to co-ordinate this form of advertising with other media.



NEWSPAPER ADVERTISING (total linage in 52 cities of the United States): average per month. Compiled by Media Records, Inc.

If something looks suspicious around the place, report it Quietly and Promptly to the Boss ...It may be important! Have it checked by *EXPERTS*...*It's Safer!!*

★ ★ ★

You are a *PRODUCTION SOLDIER*... America's First Line of Defense is *HERE*

HUMOROUS POSTER with a serious message, drawn by Cyrus Hungerford in 1941 for display in U.S. defense plants

Retail Advertising.—The major development was the increase in the amount of information the retailer was required to give. Under the labelling act administered by the Federal Trade commission, textiles, for example, must be labelled to show the percentages of the different kinds of materials in them. Drugs, likewise, must be properly described. Another outstanding trend in retailing was the growth of the cash-and-carry system and self-service in department stores. The variety chains originated the movement some years ago. Super-markets grew by leaps and bounds during 1941. There was even a tendency to use self-service in women's ready-to-wear stores and in basement sections of department stores. Ways were being devised so that customers might examine practically all of the stock without need of salespersons. Complete labelling and more factual advertising became a part of the movement.

After the fall of France and the disappearance of Paris as the fashion centre, the New York Dress institute was organized and made an aggressive start toward establishing New York as the world's fashion centre by inaugurating an extensive advertising campaign.

Consumers.—The year 1941 witnessed a widening interest of consumers in their economic role as consumers. Objectives of the "consumer movement" became integral parts of the thought and action of consumers in 1941. Although these activities received impetus from the defense programs, none was initiated solely because of defense. Heading the list of activities was consumer education, including choice-making, market selection, use and care of products and emphasis upon the relation of the consumer to the economic order. Numerous educational units were organized, including women's clubs, local consumer groups, church groups, co-operatives, community centres and defense-inspired consumer councils. Emphasis was placed on conservation and reduction of waste. Consumers were being educated to select essential goods, to have more concern for the use and care of appliances, to salvage used materials, to understand the importance of national resources, national defense and nutrition, to check the abuse of the returned-goods privilege, to cut down on deliveries and to perform some of the distribution services themselves.

Consumers were insisting more upon facts to guide them in buying and in the use and care of products, through more informative advertisements, better-informed salespersons, informative labels, grade labels and buying

guides. The demand for standards increased with the growing scarcity of goods. Consumers became less reformist toward business and more realistic and willing to co-operate with business groups, as witnessed, for example, by the Committee on Consumer Relations in Advertising and the National Consumer-Retailer council.

Consumer groups were also interested not only in the enactment of protective legislation but also in securing a voice in the administration of such measures through the growing demand for a federal department of the consumer in the cabinet.

There was clear evidence of a shift in consumer income. The net spendable income of the higher and middle groups was being reduced by heavier taxes. The lower groups were less affected by taxation and were receiving a larger share of the gross dollar income. Many marginal consumers were being brought into the active spending groups.

Research.—An outstanding achievement was the completion of the four-year study of the economic effects of advertising under the direction of Neil Borden and an advisory committee of the Harvard Graduate School of Business Administration. The study was financed by a grant by Mrs. A. W. Erickson as a memorial to her late husband who had been a noted advertising agency executive. It was carried out under the auspices of the Advertising Research foundation.

The findings of this research are set forth in a volume of nearly 1,000 pages.

The year 1941 also marked the completion of ten years of continuous measurement of the readership of advertisements in magazines, known as the Advertising Rating Service, conducted by Daniel Starch and staff. In this continuing program, approximately 120,000 individual interviews are conducted each year. The reports give the number of readers attracted by each advertisement in the magazines covered and the per-reader cost.

Afghanistan. A Muslim kingdom lying between India and Persia; area 250,000 sq.mi.; pop. (est. 1937) 10,000,000; chief towns: Kabul (cap., 80,000), Kandahar (60,000), Herat (50,000), Mazar-i-Sharif (30,000). Ruler: Muhammad Zahir Shah; languages: Persian, Pushtu, and some Turki in the north; religion: Mohammedan.

History.—Under its enlightened monarch the country was advancing steadily in education and in the industries which are expected to exercise a civilizing influence on its turbulent people. But endeavours to stir up trouble were not lacking. The ex-Amir Aman-ul-lah was hanging on to the other side of the frontier and was believed to be under nazi orders to foment disaffection. The faqir of Ipi, an old campaigner among the tribes, was also intriguing. The king, however, was most correct in his neutrality, and his handling of the German colony in the country in the closing months of 1941 gave proof of his sincerity. German nationals organized themselves as a foreign branch of the nazi party, and were developing active pro-Hitler propaganda on the approved fifth-column lines. Their position was one of some strength; they were employed as experts in economic development and in education, as engineers and as suppliers of machinery and plant for industrial enterprises. On British representations, however, the government ordered the deportation of all German and Italian nationals; and a considerable danger to India was thus averted. During the year, Sir Francis Wylie succeeded Sir William Fraser-Tytler as British minister at Kabul. (ME.)

Education.—Elementary schools exist throughout the country, but secondary schools exist only in Kabul and provincial capitals; both are free. There were, in 1940, 130 primary schools and one normal school for teachers in Kabul. In addition there were 4 secondary schools and 13 military schools. Technical, art, commercial and medical schools exist for higher education. The Kabul university was established in 1932; only a medical faculty existed in 1940.

Defense.—Army, compulsory service; peace strength 60,000.

Finance.—Revenue and expenditure about Rupees (Afghan) 150,000,000; currency: Rs. 3.95 (Afghan) = Rs. 1 (Indian). Rs. 1 (Afghan) = 5*d.* approximately, or about 8.4 cents, U.S.

Trade and Communication.—(1939–40) Exports to India: Afghan merchandise Rs. 3,97,06,681; treasure Rs. 16,655; non-Afghan merchandise Rs. 2,008. Imports: Indian produce Rs. 72,79,399; other produce (imported through India and in transit) Rs. 1,96,25,197.

Persian lambskin is one of the most important exports. Other exports are carpets, fruit, wool and cotton. Roads: trade routes, Kabul to Peshawar (India), 210 mi., and Kandahar to Chaman, 70 mi.; there were about 2,265 mi. of unmetalled roads connecting the chief towns. At the beginning of 1941 there were five wireless stations in the country.

Agriculture.—Wheat, rice, millet, maize, sheep, Persian lambskin, wool (1938) 6,800 metric tons.

Agriculture. **Crops.**—Following the severe droughts of 1934 and 1936, the United States had five consecutive years of exceptionally good crops. During these five years, total production of 53 important crops ranged from 4% to 13% above the 10-year average, 1923–32. Probably never before have there been five consecutive years of such good crops.

These five crops would have been even larger had the acreages of the '20s been planted. Acreages were 3% to 8% below those of 1923–32, whereas yields were 13% to 21% above the ten-year average. The increase in yields more than offset the decrease in acreage. The year 1941 brought the highest yields and the second largest production in history.

The 1941 production and yields of wheat, corn and sorghum were the best from 1936–41 (Table I). The only major crops with relatively low production for 1941 were cotton and tobacco. The small crops of cotton and tobacco were due in part to smaller acreage and in part to lower yields.

On the whole, the United States had been favoured since 1936 with good weather conditions for crop production. The good weather more than compensated for attempts to decrease production. Hence the nation was indebted to weather for placing it in a strong position for meeting extra wartime demands.

Livestock.—The severe droughts of 1934 and 1936 caused a drastic liquidation of the numbers of livestock on farms in the United States. With five consecutive good grain crops, forage crops and pasture that followed the droughts, stockmen restored their herds as rapidly as feed and breeding practice permitted.

The index of meat animals on farms rose from 103 on Jan. 1, 1937, to 112 in 1941 (Table II). The numbers of animals on farms Jan. 1942 were even higher. The supply of meat animals on farms in 1941 was 12% greater than during the ten years preceding the drought, greater than the peak year of the '20s, and much greater than at any previous high point in history.

The greatest expansion and contraction were in numbers of hogs. The largest number of hogs during the '20s, 69,000,000, dwindled to 43,000,000 after the droughts of the early '30s (Table II). However, with the good corn crops of 1937 to 1939, the number increased rapidly, reaching 60,000,000 by 1940. Beef cattle numbers declined from a high of 40,000,000 during the '20s to 31,000,000 during the '30s. Since 1939 they have steadily increased. The numbers of dairy cattle have increased steadily regardless of droughts. The total number of cattle in 1941 was 10% above the drought level and about the same as the high point of the '20s. Numbers of sheep and lambs have steadily increased since the '20s and were in 1941 near the highest in history.

By 1941 the index of meat animals per capita, 101, had risen to slightly above the average of 1923–32. Even though per capita numbers of livestock were high relative to drought years, they were considerably below the high point of the '20s, 122. Although the total supplies of meat animals were the highest in history, the amount of meat available to each individual was considerably less than the peak of the '20s and much less than the earlier peaks. (*See* also LIVESTOCK.)

Prices.—The outstanding phenomenon of the agricultural situation during 1941 was the sharp rise in prices of all farm products. During the year ending in Sept. 1941, United States farm prices rose more than 40%. The rise was widespread. The greatest percentage advances occurred in prices of cotton and hogs, which rose 91% and 80%, respectively. Most farm products rose from 30% to 50%.

The products which rose the most were not necessarily those with the highest prices. For example, in Sept. 1941, prices of cotton and hogs were very little more than the average of all farm products. Hogs were not as high as lambs or beef cattle. In general, prices of livestock and livestock products were much higher than grains and other foods.

Table I.—*Crop Production in the United States*

Crop	1923–1932 average	Drought 1936	Five good crop years

*December 1 estimate. †1924–32 average.

The rise in prices of farm products was due to a combination of several factors. Higher government loan rates for products sealed under the farm program contributed to increased prices of grains and cotton. Purchases by the government for British account raised prices of certain livestock products. A short crop, high domestic consumption, and rigid restriction on sales of government-held cotton raised cotton prices.

Some persons contended that the advance in farm prices was due to increased consumer purchasing power. However, it is doubtful whether the demand for food increased with incomes. The additional incomes went for automobiles, clothing and other nonfood items.

One of the reasons farm prices in the United States rose was that world prices of these products rose. Since the gold content of the dollar was fixed, United States prices necessarily followed world prices. World prices rose probably because production in war areas declined and because the demand for food products rose relative to the demand for money. (*See* also PRICES.)

Parity Farm Prices.—The concept of a parity for farm prices was developed during the depression of the early '30s. At that time, prices farmers received were only about one-half the prices they paid for articles bought. It was argued that prices should be raised so that farmers would have as much purchasing power in terms of things they bought as they had during 1910–14. Farm prices have tended to be high relative to farm costs when the general price level was rising; and low, when falling.

The period 1910–14 was chosen as one during which a normal relationship existed between farm prices and costs because the price level was relatively stable following a period of gradual advance. When the price level fell from 1920 to 1932, prices that farmers received fell more rapidly and by a greater amount than prices they paid. Thus, the purchasing power of farm products declined to about one-half of parity. Since 1932 the various farm programs have aimed at restoring parity farm prices; that is, a purchasing power equal to 1910–14. The purchasing power of farm prices rose sharply with the droughts of 1934 and 1936 (fig. 1). Farm prices almost reached parity during a brief period in the spring of 1937, but net farm incomes did not reach parity because of the very low production during the drought years.

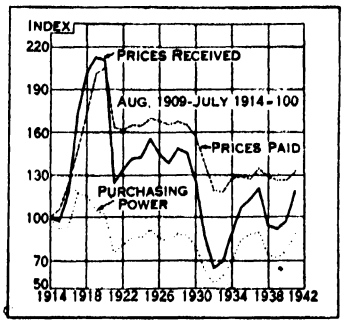

Fig. 1.—INDEX NUMBERS OF PRICES RECEIVED BY FARMERS FOR FARM PRODUCTS, PRICES PAID (INCLUDING INTEREST AND TAXES), AND THE PURCHASING POWER OF FARM PRODUCTS, 1914 to 1941. Prices received by farmers fluctuated more violently than prices of articles they bought. With deflation, the purchasing power of farm products fell; and, with rising prices, it rose

From Aug. 1939 to Oct. 1941, farm prices rose from 70% to 101% of parity. At the same time, production levels continued high. As a result of parity prices and good crops, farmers probably received parity incomes in 1941 for the first time since 1919.

During 1941 there was much controversy over the level of prices fair to farmers. In the debates on price fixing, some persons contended that there was no justification for farm prices as high as parity. It was argued that the 1910–14 base period was one of abnormal prosperity for farmers. It was contended that, since farm prices had been below parity for two decades, their *normal* level should be lower than 1910–14. It was not recognized that farm prices were low during the '20s and '30s primarily because of the effect of falling prices on the price structure rather than because of any fundamental changes in agriculture. The low purchasing power of farm prices during those years was not normal. This is further indicated by the fact that, when the general price structure rose during 1941, farm prices reached parity in spite of large crops. With a further rise in the general price level, it was to be expected that farm prices would rise to 110% to 115% of parity, or even higher. The most justifiable level of farm prices may not

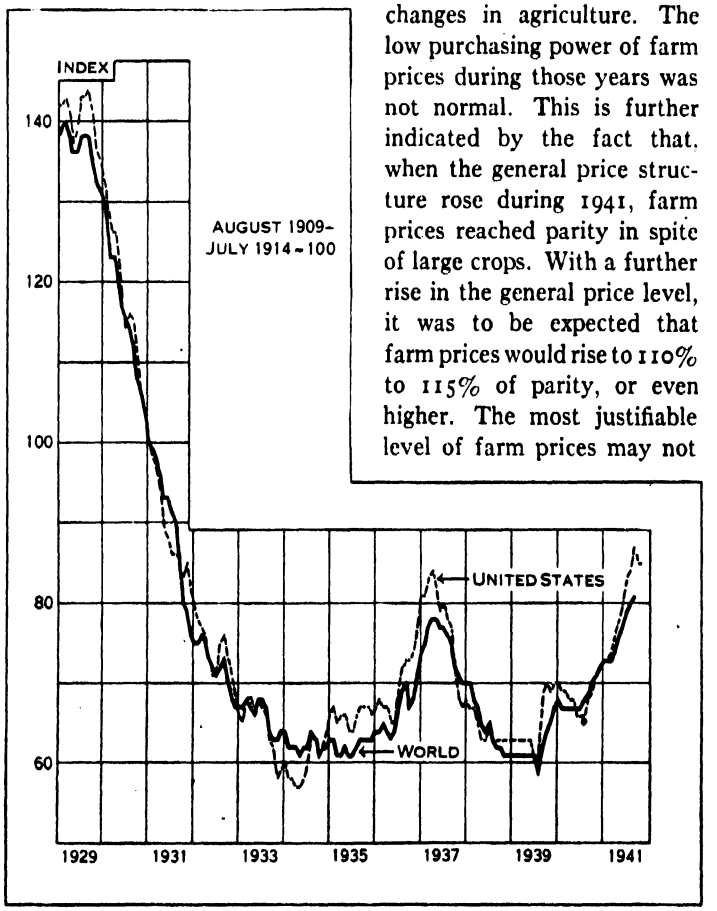

Fig. 2.—INDEX NUMBERS OF PRICES OF 40 BASIC COMMODITIES FOR THE UNITED STATES AND THE WORLD, IN GOLD, 1929 TO 1941. From 1929 to 1933, United States prices fell with world prices; from 1935–37 and 1939–41, they rose with world prices

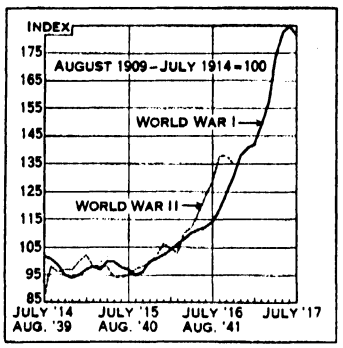

Fig. 3.—INDEX NUMBERS OF FARM PRICES OF ALL FARM PRODUCTS IN THE UNITED STATES, WORLD WAR I AND WORLD WAR II. During the first 24 months of World War II, prices paid to producers for farm products followed approximately the same course as that for World War I

be the low level of 1921 or 1932 following deflation, nor the high levels of 1917–18, nor some high level in the early '40s following inflation. The best estimate of equitable prices for farmers must be made from some period such as 1910–14 when the whole price level was in equilibrium.

In 1941 the 1910–14 farm price relationships were defined by law as parity; that is, these relationships purported to place agriculture on a parity with other industries. However, there is considerable justification for farm prices which would give farmers more purchasing power than in 1910–14. For more than a century prior to 1910 the purchasing power of farm prices had gradually risen. With declining per capita food production, this upward trend should have continued. Of course it was interrupted by the maladjustments in the price structure following World War I. However, in the long run, the upward trend will probably continue. Higher purchasing power for agriculture is also justified by the higher purchasing power of city workers. At the same time that farm prices reached parity during the summer of 1941, the purchasing power of city wages in terms of city costs of living rose to 84% above parity. City wages were above parity continuously during the '20s and '30s. In view of these facts, it would seem that the rising farm prices of 1941 merely restored to farmers a part of their rightful standard of living.

Table II.—*Number of Livestock on Farms in the U. S., January 1942*

Year	000's omitted					Index of number of meat animals	
	Sheep and lambs	Hogs and pigs	Beef cattle	Dairy cattle	Chickens	Total	Per Capita
1923–32 average	44,800	59,000	30,200	32,000	446,000	100	100

World and United States Prices.—The spectacular rise in prices of farm and other basic commodities during 1941 was world-wide (fig. 2). Prices in the United States merely followed the trend of prices in other countries. In terms of gold, prices have usually been about the same in different parts of the world. By 1934, both world and United States prices in gold had fallen to one-half their 1929 level. Both made a moderate recovery from 1934 to 1937, but lost these gains from the spring of 1937 to the summer of 1939. From the outbreak of World War II to the fall of 1941, both the United States and world prices had risen 40%, back to the peak of 1937.

As long as the United States price level in gold is tied to the world price level in gold and the dollar is a fixed amount of gold, United States prices in terms of dollars will also be tied to world prices in gold. This is a very simple but important principle not commonly understood or taken into consideration in efforts to control prices.

The efforts of neither the Farm board of the Hoover administration nor the AAA program of the Roosevelt administration were

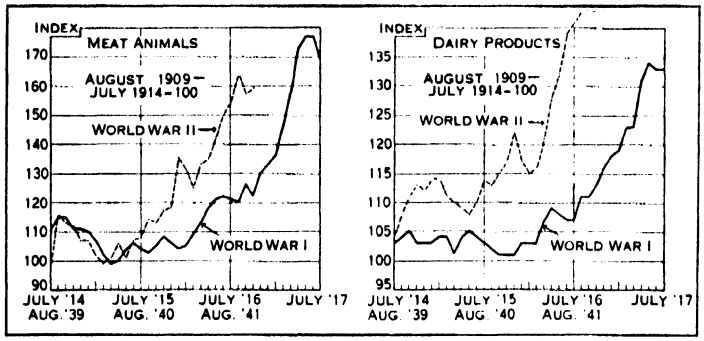

Fig. 4.—INDEX NUMRERS OF FARM PRICES OF MEAT ANIMALS AND DAIRY PRODUCTS FOR WORLD WARS I AND II. During the second year of World War II, prices rose more rapidly and by a greater amount than during the same period of World War I. This held true for both meat animals and dairy products

successful in raising world prices or raising United States prices in gold relative to the rest of the world. Similarly, efforts to curb advancing prices in 1941 were, and would probably be in 1942, harassed by an advancing world price level.

Prices during World Wars I and II.—During the first 24 mo. of World War II, world and United States prices of basic commodities rose about the same amount as during the comparable period of World War I. Similarly, United States farm prices rose about the same amount during the first two years of both wars (fig. 3). The rise in farm prices during World War II was a little greater than during World War I, because farm prices were especially depressed relative to other prices at the outbreak of World War II.

During the first 24 mo. of World War II, prices of meat animals rose much more rapidly than was the case in World War I (fig. 4, left). Prior to World War I, the United States raised more meat than it consumed. However, prior to World War II, consumption was practically equal to production. The United States had less meat to spare at the outbreak of World War II than at the beginning of World War I. Consequently, additional wartime demands for meat raised prices faster during the later conflict.

Prices of dairy products also rose faster during World War II (fig. 4, right). Prior to 1914, the United States exported small amounts of dairy products, whereas prior to 1939, imports were the rule. Because of the shortage in the United States, the additional demand for export to Great Britain raised prices sharply.

Prices of cotton and cotton-seed, chickens and eggs and fruits during the first part of World War II followed their World War I patterns (figs. 5 and 6). Grain prices rose by about the same amounts during the first two years of both wars. However, the level of grain prices was somewhat lower during 1939 to 1941 than 1914 to 1916.

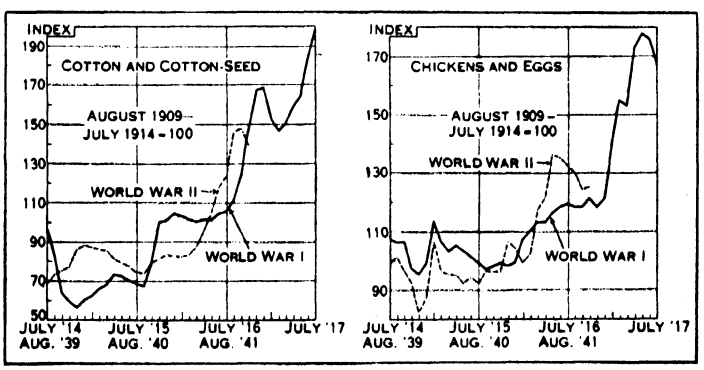

Fig. 5.—INDEX NUMBERS OF FARM PRICES OF COTTON AND COTTON-SEED AND CHICKENS AND EGGS FOR WORLD WARS I AND II. After the first twelve months of World Wars I and II, prices of cotton began to rise. During World War II, the rise was especially sharp during 1941. During the first two years of both wars, prices of chickens and eggs followed about the same course

WHILE THE GERMAN ARMIES drove deeper into the U.S.S.R. in the summer of 1941, women collectivist farmers toiled long hours to get the harvest in before the enemy arrived

AAA Farm Program.—From 1939 to 1941, farmers were operating under the AAA act of 1938, which continued the soil conservation program and commodity loans. The act improved marketing agreements and quotas and added the new features, parity payments, crop insurance and surplus commodity disposal. During these years, greater compliance with the various farm programs was encouraged by parity payments and by the threat or actual existence of more widespread marketing agreements.

In 1939–40 the agricultural program cost the United States almost $1,000,000,000 (Table III). More than half this amount was for conservation payments. The next largest item was parity payments, aggregating $215,000,000. Continental sugar producers collected $27,000,000; and Hawaii and Puerto Rico producers, $20,000,000. The costs of administration averaged about 7% of the payments. The 1940–41 agricultural program cost about the same as the 1939–40 program.

Table III.—*Costs of Agricultural Adjustment Program, Fiscal Year 1939–40*

Agricultural conservation payments	$518,000,000
Parity payments	215,000,000
Payments for purchase of agricultural commodities	67,000,000
Payments under Sugar act	47,000,000
Expenses, county	43,000,000
Expenses, Washington, D.C.	18,000,000
Total	$908,000,000

Table IV.—*Payments to Farmers under the 1939–40 Agricultural Adjustment Program*

Cotton	$215,000,000	Range	$ 14,000,000
Corn	150,000,000	General†	172,000,000
Wheat	138,000,000		$756,000,000
Sugar	47,000,000		
Other crops*	20,000,000		

*Tobacco, potatoes, rice, vegetables, naval stores and peanuts, in order named.
†General division, $71,000,000; and soil-building practices, $101,000,000.

Most of the money paid farmers under the 1939 farm program went to cotton, corn and wheat producers (Table IV). Sugar was also favoured. For all other crops, the farmers collected probably less than 5% of the total; where these crops represented more than half the total value of all crops. The specific payments to cotton producers were about 40% of the value of the crop; wheat, 27%; corn, 10%; and other crops, less than 1%.

The largest payment in any one state went to Texas, $99,000,000 (Table V). There were 11 states that received from $27,000,000 to $61,000,000. In general, the most favoured states were in areas of intensive corn, cotton or wheat production. Payments in southern states were approximately 18% of the farm value of all southern crops; and in northern states, 14%.

Table V.—*Approximate Distribution of Gov't Expenditures to States, 1939–40*

Texas	$99,000,000	North Dakota	$32,000,000
Iowa	61,000,000	Minnesota	31,000,000
Illinois	43,000,000	Oklahoma	29,000,000
Nebraska	37,000,000	Missouri	28,000,000
Kansas	36,000,000	Arkansas	28,000,000
Mississippi	33,000,000	Alabama	27,000,000

40 states and territories, average....$9,000,000

After eight years of AAA programs in the United States, some generalizations can be made concerning their effect on farmers and agriculture.

As a relief measure for farmers, cash payments no doubt raised the standard of living of many farmers relative to the rest of the U.S. These payments were much needed and gratefully received. They were the farm counterpart of city relief cheques. However, unlike city relief, farm payments were given in proportion to reduction in production rather than in proportion to needs.

One of the effects of the AAA program of reducing production was to raise prices. However, raising prices by reducing production did not raise farm income. Prices and production tended to be compensating factors; that is, a large crop at low prices brought about as many dollars as a small crop at high prices. Another effect of reducing production and raising prices in the United States was to encourage high-cost producers in other countries to increase production. Thus the program tended to turn U.S. foreign markets over to foreign producers. To regain these foreign markets, the American farmer could eliminate this foreign competition only by selling his product at unremunerative prices for several years.

It is difficult for a democracy to operate a successful ever-

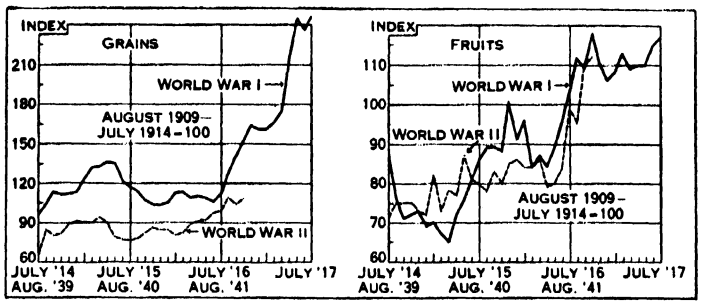

Fig. 6.—INDEX NUMBERS OF FARM PRICES OF GRAINS AND FRUITS FOR WORLD WARS I AND II. During the first two years of World War I and World War II, there was relatively little rise in the price of grains. Prices of fruits followed about the same course during the two wars

normal granary. The tendency is to put everything in and take nothing out. The only salvation for an ever-normal granary is an unpredictable sharp rise in prices because of severe drought, war, or some other force. Schemes for holding crops fail miserably when prices fall for several years. The Farm board, which operated from the late '20s to the early '30s, gave an excellent illustration of an ever-normal granary when prices were falling.

An avowed advantage of the ever-normal granary has been to carry part of large production in good crop years over into poor crop years. However, in the case of cotton, this was formerly done by farmers and the trade. In the case of grains, the excesses of good years were carried over into following crop years largely in the form of livestock. When grain was plentiful and relatively cheap, it was profitable to feed more to the existing livestock. With continued good crops, the numbers of livestock continued large; but, when short crops occurred, feeding was no longer profitable and the slaughter of livestock temporarily increased, thereby reducing the number. During drought years, the livestock produced from current poor crops necessarily declined, but the deficiency was made up from the slaughter of the excess accumulated during the good crop years. Thus farmers tended to operate their own ever-normal granary. They kept the grain in the form of meat animals rather than in corn cribs and grain elevators. In many ways, the farmer's system was preferable to the AAA system because the surplus was kept in a form more quickly available to city consumers and for emergencies, such as additional foreign demands in time of war.

The conservation aspects of the farm program have been effective in encouraging better soil-building practices, reseeding of pastures, erosion control, protective summer fallowing, green manure and cover crops, and the like. Undoubtedly, a somewhat greater-than-otherwise future production has been provided for. Of course it must be realized that this was accomplished at the expense of a somewhat reduced immediate production.

A provision for government sponsored crop insurance was included in the AAA act of 1938. An agency was set up to write insurance against loss in wheat yields. Considerable insurance was written against the wheat crops of 1939 to 1941, particularly in the great plains area. In general, the popularity of this part of the program depended on the size of the crop the preceding year. Where farmers carried insurance every year, their incomes from wheat were more or less stabilized.

From 1935 to 1941, one of the features of the AAA was the Surplus Marketing administration which bought farm products for government account and gave them to those in low-income groups. This action was supposed to serve two purposes: first, to take troublesome surpluses off the markets so that farmers would obtain better prices; and second, to improve the diets of those with low incomes. This part of the AAA program was probably more effective as an urban relief measure than as an aid to farmers. Farmers' benefits depended only on the extent to which

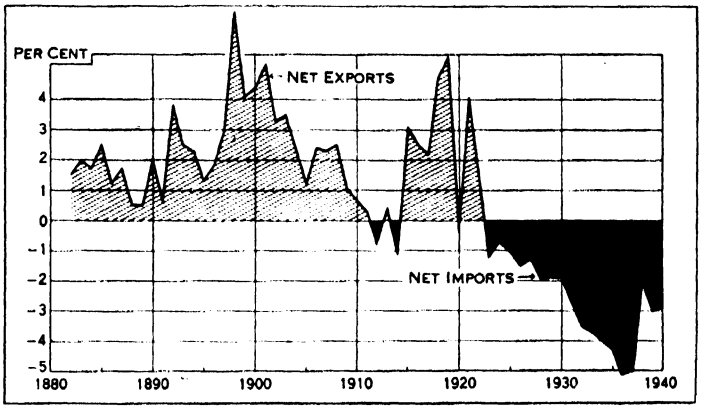

Fig. 8.—VALUE OF NET U.S. EXPORTS OR IMPORTS OF FOOD IN PER CENT OF FARM INCOME, 1882–1940. From about 1890 to about 1900, net exports mounted relative to production. From 1900 to the war in 1914, the excess of exports vanished. During and after the war from 1915 to 1922, there was an excess of exports of food. Since 1923, imports of food have exceeded exports; and in 1936, were 5% of farm income. Even after four good crop years, about 3% more food was consumed in 1940 than produced in the nation

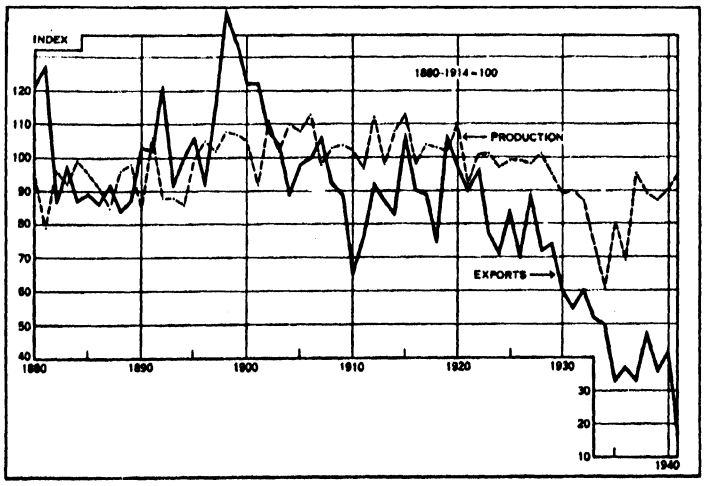
prices were raised. No doubt some prices were raised, but possibly prices of products not purchased under the program were correspondingly lowered. The rise in the average price of farm products depended on the rise in the average food consumption in the U.S. Whether the consumption of the low-income classes was actually increased is debatable. People tend to eat about the same amounts of food whether their incomes are high or low and whether they obtain this food with money from their own earnings, with relief cheques, or directly from the Salvation Army, or the Surplus Marketing administration.

Fig. 7.—INDEX NUMBERS OF THE PHYSICAL VOLUME OF CROP PRODUCTION PER CAPITA AND OF TOTAL AGRICULTURAL EXPORTS OF THE UNITED STATES, 1880–1941. From 1880 to about 1915, there was some tendency for the production of crops per capita to increase slightly. Since that time, they have declined. The physical volume of exports rose to about the turn of the century. Thereafter, a decline set in and continued to 1941. The only interruption was during and immediately following the war from 1915 to 1922



Conflict Over Agricultural Policy.—As a result of the depression and low prices, efforts were made to raise prices by reducing production. As a result of rising prices in 1941, some persons contended that production should be increased to prevent prices from rising.

It has been the AAA policy to restrict production and raise prices. This policy was to continue for 1942 in spite of increased demands for livestock products for export. Although the AAA cooperated with the United States department of agriculture in encouraging increased livestock production during the fall of 1941, the AAA contracts for 1942 called for continued restricted acreages of corn and wheat.

Diametrically opposed to the AAA policy was that of the Office of Price Administration (*q.v.*), which wanted greater production and low prices. Any price control bill is at cross-purposes with the AAA.

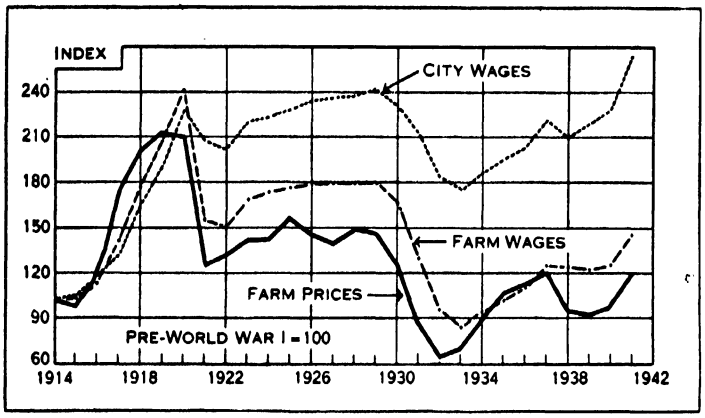


Fig. 9.—INDEX NUMBERS OF FARM AND CITY WAGES AND FARM PRICES, 1914–41. Although farm wages tend to be a compromise between farm prices and city wages, they have followed farm prices more closely than city wages

The price control advocates represent the interest of urban consumers who desire cheap food and clothing.

The interests of the farmer are not represented by either the AAA or the Office of Price Administration. The farmer wants neither low production and high prices nor high production and low prices. He wants high production and high prices. If it were not for the AAA or the Office of Price Administration, he might get both in 1942. High production and high prices would be more to the advantage of both farmers and consumers than any other combination. The interests of the farmer have been represented most truly by the agricultural elements of congress and the United States department of agriculture. The farm bloc in congress has attempted to safeguard the farmer by insisting on what appeared at the time to be fair levels for agricultural price ceilings.

The United States department of agriculture has agreed with the farm bloc on the 110% of parity ceilings. It has also gone as far as it can in advocating increased production without conflicting with the AAA.

The formerly small agency, the Surplus Marketing administration of the AAA, was occupied with purchasing farm products for relief groups. In 1941 this agency expanded rapidly into an organization to purchase food for Britain under the lend-lease program. Prior to 1941, expenditures for relief aggregated $50,000,000 to $75,000,000. Late in 1941, expenditures for lend-lease were at a rate of about $500,000,000 a year. Expenditures in 1942 were expected to reach $1,000,000,000.

For 1942 United States farmers were urged to increase their total production about 7% over that of 1941. This was necessary to provide Britain with the food that it would need. During World War I, Great Britain imported dairy, poultry and pork products from Denmark and the Netherlands. In 1942, this would be impossible. Most of the increases called for were not in crop production but rather in the conversion of good crops into livestock and livestock products.

Table VI.—*Intended Exports of Food for 1942 from the United States*

Commodity	Exports		Increase of 1942 over normal	Increase as a per cent of 1936–40 production
	Actual Average 1936 to 1941	Goal 1942		
Livestock Products				
Milk, million pounds	−208	5,108	+5,316	+ 5
Eggs, million dozens	3	504	+ 501	+15
Pork, million pounds	101	1,350	+1,249	+15
Lard, million pounds	215	640	+ 425	+23
Beef and veal, million pounds	−155	− 80	+ 75	+ 1
Food crops				
Wheat, million bushels	54	30	− 24	− 3
Corn, million bushels	25	10	− 15	− 1
Rice, million bushels	20	25	+ 5	+10
Dry beans, million bags	1	4	+ 3	+21
Canned vegetables, million cases	− 1	3	+ 4	+ 4
Canned fruit, million cases	3	6	+ 3	+11
Nonfood crops				
Cotton, million bales	4.3	1.0	− 3.3	−25
Tobacco, million pounds	410	441	+ 31	+ 2

Exports of dairy products desired for 1942 are the equivalent of 5,000,000,000 lb. of milk (Table VI). These exports of cheese, butter, canned milk, etc., are equivalent to about one pint of whole milk for each Briton, every three days.

The expected shipments of eggs were expected to be about 500,000,000 doz., or three eggs per person per week.

It was hoped that the U.S.A. could supply Britain with 1,350,000,000 lb. of pork and 640,000,000 lb. of lard in 1942. This is equivalent to about two-thirds lb. of pork and one-third lb. of lard per week per capita.

Because the United States eats more beef than it produces, it would not be able to ship Great Britain any beef except at the expense of domestic consumption or from imports from other countries.

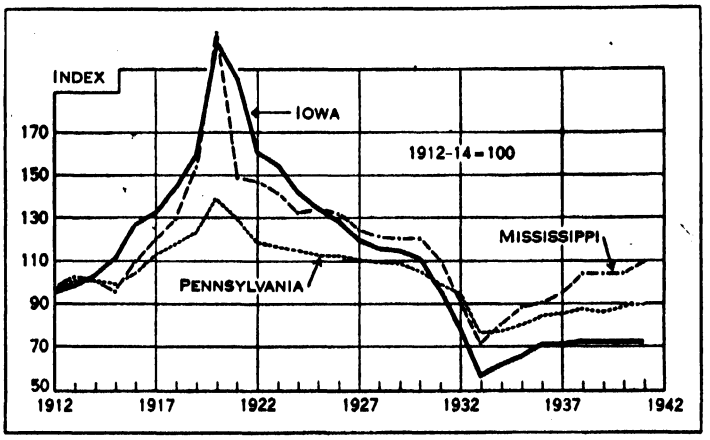
From the standpoint of U.S. agriculture, supplying millions with these products meant an increase in production over the 1936–40 average. The increase in milk and dairy products was 5% of normal production.

Foreign Trade.—Since about 1920, the exports of farm products per capita have been more than halved (fig. 7). This was due primarily to a decline in farm production per capita. Even with the five good crops since 1936, the production per capita has not reached that of the '20s or of the World War I period. Prior to the '20s, the United States produced more food than it consumed, and exports were large. Since then, food production has not kept pace with population, and exports declined and imports rose. Since 1923, the United States, the world's greatest and most efficient food producer, has continuously imported more food than it exported (fig. 8).

Agricultural exports for 1940-41 aggregated about $350,000,000, the lowest in 69 years. Agricultural exports have not only declined in terms of dollars, but have declined even faster relative to exports of other commodities. The 1940–41 agricultural exports declined to 9% of the total exports and to 3% of agricultural income (fig. 8). The decline in exports of agricultural products up to 1941 was due to (a) the long-time tendency for population to overtake food production, and (b) the short-time effects of the blockade of Europe. Most of the short-time reduction was in the exports of cotton. The next most important reductions due to the blockade were in exports of fruits, tobacco, grains, feeds and lard.

Exports of many other farm products increased. For instance, evaporated and condensed milk increased from $3,000,000 in 1939–40 to $20,000,000 in 1940–41. Cheese exports rose $400,000 to $4,700,000. However cheese exports were still only slightly more than imports of cheese. Exports of eggs rose from $1,000,000 to $4,500,000. Although the increases in exports of these live-

Fig. 10.—INDEX NUMBERS OF VALUE OF FARM LAND PER ACRE IN IOWA, MISSISSIPPI AND PENNSYLVANIA, 1912–41. During World War I, land values rose much higher in Iowa and Mississippi than in Pennsylvania. With deflation, land values fell least in Pennsylvania



stock products were relatively great compared with former exports, they were small compared with the decreases in exports of cotton, tobacco, fruits and grains. Likewise, these increases in exports of livestock products were generally small compared with their production.

From 1939–40 to 1940–41, the total imports of agricultural products rose about 20%. Imports of cheese, olive oil, wines and tung oil declined about one-half. Imports of wool trebled. Imports of cocoa increased about 60%; hides, 50% and molasses, 35%. Most of these changes were due to wartime conditions.

In 1940–41 agricultural imports were more than four times exports. About one-half of these imports were products which did not compete with American agriculture, but the other half did. When only farm products produced in the United States are considered, that nation has normally sent abroad a very small excess of $300,000,000 in net exports. This has been about 3% of the total United States farm production.

When all agricultural products raised throughout the world are considered, the United States has had net imports of about 3% of United States production. Net imports of food have averaged about 5% of United States food production.

World Conditions and American Agriculture.—The British attempt to blockade Europe and the axis efforts to blockade Great Britain increased the dangers of ocean transportation and raised transportation rates. This has had two types of effect on American agriculture. First, the exports of farm products, which were previously large, such as cotton, tobacco and fruit, have greatly declined. The largest part of the previous market, continental Europe, has been shut off. Secondly, exports of certain foods, such as livestock products, have increased. Great Britain, which in peacetime obtained these foodstuffs from continental Europe and from distant parts of the world, was forced to buy from the United States because of (1) the blockade of Europe and (2) the shortage of shipping space.

Farm Population.—The total population of the continental United States increased from 4,000,000 in 1790 to 132,000,000 in 1940. During this century and a half, the proportion of persons living on farms or engaged in agriculture declined from about 85% to about 25%.

The farm population increased steadily until 1910 although at no time did it increase as fast as the total population. From 1910 to 1930, the rate of increase in total population slowed, and farm population actually declined about 6%. Increasing efficiency enabled farmers to feed an increasing urban population. From 1930 to 1940, the total population increased, but the farm population remained unchanged.

Normally, there has been a movement of population from farms to cities. Cities have needed an influx of farm population for two reasons. First, industrial activity in the United States has increased rapidly; and second, city people have not borne enough children to reproduce themselves, let alone to increase the population.

In 1940 the urban population produced only 74% of the number of children required to maintain a stable population (Table VII). Farmers have exported a surplus of population to the cities for two reasons: (1) agriculture has not grown so fast as industry; and (2) farmers have raised more children than needed to reproduce their kind. In 1940 the rural farm population produced 44% more children than was required to maintain a stable rural farm population. Farmers have always produced a surplus of replacements because:

1. The cost of raising children was comparatively low.
2. Children were relatively useful on farms.
3. A relatively high percentage of the population was married, and a relatively low proportion was gainfully employed in other industries.
4. Married people living on farms average younger ages than those in cities.

Farm rural	150	144
Total	111	96

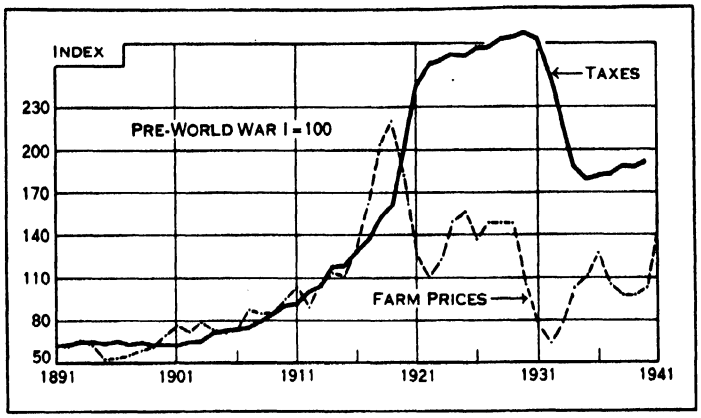

Fig. 11.—INDEX NUMBERS OF TAXES PAID PER ACRE AND PRICES OF FARM PRODUCTS, 1891–1940. Taxes have risen relative to prices. The great depression of the early '30s was the only force sufficient to reduce farm taxes materially

In 1940 the excess farm births were not sufficient to compensate for the deficiency in urban births, and the U.S.A. produced only 96% of the children required to maintain a stable population (Table VII). In 1930, after several years of urban prosperity, the United States was producing 111% of the children required to maintain a stable population. The decline from 111% in 1930 to 96% in 1940 was probably due to the effect of the prolonged depression. Birth rates declined during this period both in cities and on farms. The deficit in the city birth rate increased from 12% to 26%, and the surplus in the farm birth rate decreased from 59% to 44%.

The United States department of agriculture estimates the movement of persons to and from farms. During the urban prosperity of the '20s, the net farm export to cities was 630,000 persons per year. During the next decade, the net movement away from farms averaged only 218,000 persons per year.

The average annual movement away from farms during the '20s, 630,000, was accompanied by a decline of about 1,450,000 in the farm population. During the '30s the net movement declined materially, and the farm population did not change.

The surplus of farm population during the '20s was 485,000 per year. If only this number had been sent to the cities, farm population would have been stable. During the '20s, the surplus all went to the cities, and more went along in addition because urban times were good. However, during the '30s, only the surplus went to cities, because during the urban depression there were few opportunities in cities and the cost of living in cities was high relative to that on farms.

In 1941 high wages in war and other city industries attracted large numbers from farms. Military service also reduced the farm population. It is probable that at least 1,000,000 persons left farms for other work during 1941.

Farm Wages.—During Oct. 1941 the average hired man in the United States received $37.45 per month with board, the highest wage since 1930. Farm wages with board varied from $16 in South Carolina to $62 in California. Farm wages were generally highest in the northwest and in the Rocky mountain and Pacific states and lowest in the south.

During the 12 months, Oct. 1940 to Oct. 1941, farm wage rates rose 28%.

Over the last 30 years, farm wages have been affected by two factors, city wages and farm prices (fig. 9). The upward trend in city wages, plus the competition for labour between cities and farms, have resulted in some rise in farm wages relative to farm prices. However, farm wages have followed the major fluctuations in farm prices. During the depression of the early '30s, farm wages, which declined 60%, were more flexible than city wages, which declined only 32%.

During sharp rises in farm prices, farm wages follow with only a few months' lag. From 1916 to 1917 farm prices rose about 50% and wages 25% (Table VIII). During 1918 wages rose to the level of farm prices in 1917. By the end of the war, both prices and wages had about doubled.

Table VIII.—*Farm Wages and Farm Prices, World Wars I and II*

Year	World War I		Year	World War II	
	Farm wages	Farm prices		Farm wages	Farm prices
1914	100	100	1939	100	100
1915	102	97	1940	102	105
1916	112	117	1941	119*	130*
1917	140	173			
1918	175	200			
1919	205	211			

*Preliminary.

During the first two years of World War II, farm wages again responded to the advance in farm prices. In 1941 farm prices were about one-third higher than the 1939 level; and wages, one-fifth higher (Table VIII).

Farm Land.—The total value of farm land in the United States is about $35,000,000,000. The farm land between the Rocky and Appalachian mountains, north of the Ohio river, is worth almost one-half the total. The farms of the south are worth about $10,000,000,000. The farm lands east of the Appalachians and in the Pacific states are worth about the same, more than $3,000,000,000 in each of the regions referred to. The mountain states, which occupy a large area, are worth about $2,000,000,000.

From pre-World War I to 1920 the United States experienced a spectacular rise in prices of farm products. A part of this rise was reflected in the price of farm land. Farm land in Iowa, Mississippi, and several other central and southern states, doubled in price (fig. 10). In eastern United States, land prices rose 30% to 50%; and in the far west, about 50%. From 1920 to 1933 prices of both farm products and farm land fell disastrously. Iowa land prices fell more than 70%; and Mississippi land prices fell almost as much. On the other hand, land values in the eastern states fell only 20% to 40%.

Relative to their long-time relationship, Iowa land was higher than Pennsylvania land in 1920, but the reverse was true in 1933.

From 1933 to 1941 prices of farm real estate in the United States generally rose. Although land values in the Dakotas and Nebraska fell still further, values in the eastern part of the corn belt and the southern states rose as much as 40% to 50%. In general, land values in Atlantic and Pacific coastal areas rose 5% to 15%.

From March 1, 1940 to March 1941 land values in the United States changed very little, rising only 1%. Southern land values east of the Mississippi rose the most, about 3%. It is probable that land values rose slightly more during the summer of 1941 when prices of farm products rose rapidly.

Farm Taxation.—Farm real estate bears most of the direct taxes paid by farmers. About two-thirds of farm taxes are real estate taxes. Personal property taxes represent about 10%; gasoline taxes and automobile licences about 25%. Other taxes are negligible, about 2% to 3% of the total.

For at least a century, farm taxes in the United States have steadily risen. This long-time increase has been due to expanding expenditures by state and local governments. With passing time, people tend to supply themselves collectively with greater and greater amounts of services. This tendency has persisted throughout most parts of the world. Roads have been modernized with the coming of the automobile. Schools have become larger with more instruction given and better attendance, and school teachers have more training and receive higher salaries.

Although farm taxes have risen with passing time, they have been somewhat related to changes in farm prices. For example, from the Civil War to the '90s, farm prices fell and taxes rose very little. From the '90s to 1914, both prices and taxes almost doubled (fig. 11). During and immediately following World War I, prices more than doubled and so did taxes. During the '20s, farm prices fell, but taxes continued to rise slowly. With the great depression of the early '30s, farm prices were halved and taxes were reduced by one-third. This was the first time for which records are available that farm taxes were materially reduced.

Farm taxes paid in 1941 were slightly above the low point of 1935 but about 30% below the peak of 1930.

Farm Credit.—In 1941 the federal government and semi-governmental agencies had outstanding loans to agriculture upwards of $4,000,000,000, about one-half of which were mortgages on farms. During the year ending June 30, 1941 there was an increase in prices paid to farmers for farm products, and delinquent loans decreased about one-fifth. On June 30, 1940 delinquent Federal Land bank mortgage loans were 19% of outstanding mortgages, compared with 16% June 30, 1941. Altogether, there are about $7,000,000,000 of mortgages on farms in the United States. Individuals and the government each have 40% of the total loans outstanding, life insurance companies, about 13%; and commercial banks and joint stock land banks, the remainder. Since 1930 there has been a steady decline in farm mortgage foreclosure sales in the United States. Foreclosure sales declined from 93 per 1,000 farms mortgaged in 1934 to 14 in 1940. Because of high prices of farm products, foreclosures in 1941 were still less. In addition to land mortgages, the government lends funds to co-operatives. Sept. 1941 there were $105,000,000 outstanding. Co-operatives borrowed almost twice as much money in 1941 as in 1940. The government also makes short-term loans to farmers for various types of production credit. These loans aggregated about $1,000,000,000 in 1941.

The amount of mortgage loans made in the nine months ending Sept. 30, 1941 was only 3.3% of the mortgages outstanding; whereas, in the case of loans to co-operatives and production loans to farmers, the loans were a little more than the outstanding loans.

The Farm Security administration was organized to assist farmers who could not obtain credit through other agencies. They lend funds for a 40-year period at 3% for practically the total value of the real estate and chattels. They make loans for the operation of a farm and its purchase. Most of these loans are in the south to aid tenants to become landowners and to aid small landowners to make a living. There were in 1941 about 13,000 loans, averaging about $5,800.

Farmers also received government credit through crop and feed loans, rural electrification loans, and commodity loans under the AAA.

Probably at no other time in history have farmers had the credit facilities that were available in 1941. (*See* FARM MORTGAGES; COMMODITY CREDIT CORPORATION.)

Experiment Stations.—Since agriculture is an industry with small units, the individual farmer cannot carry on research work concerning the many problems of agriculture, nor even on those peculiar to his farm. For this reason, the United States and most other countries of the world have developed experiment stations to study problems of pure and applied science in agriculture.

For three-quarters of a century there has been a gradual expansion in the number of such agencies and in the type of work undertaken. In 1941 there were agricultural experiment stations in the 48 states, Alaska, Hawaii and Puerto Rico. These institutions have about 4,600 workers conducting research on more than 8,500 projects. The work costs about $21,000,000, one-third of which is supported by federal appropriations and two-thirds by state funds. The average cost of this work is about $3 per farm.

(F. A. PE.; K. R. B.)

Great Britain.—The system of state control of British farming, exercised through the agency of county war executive committees, was continued during 1941 and was extended to embrace almost every section of the industry. The general objective remained unchanged; this was to increase the output of essential food crops—especially wheat, oats, potatoes, beet sugar and the more productive and nutritious vegetables—along with milk and other dairy products. The means used, which were many, included the following:

First, a considerable area of land that had become derelict was reclaimed. This involved large-scale drainage operations, the clearing of wide areas of scrub, the application of mass doses of lime and fertilizers and the use of special plows and other heavy implements of tillage. The necessary dredging and bush-clearing equipment and track-laying tractors were produced in Britain in considerable numbers and others were imported. There were some quite spectacular achievements, and the total result was highly satisfactory.

Second, the year's program included the plowing up of a further 2,000,000 ac. of grassland for arable cropping. Despite difficult seasonal conditions the program was more than completed, thanks largely to the generous supply of tractors and implements from the United States, Canada and Australia.

Third, there was an intensive drive to raise the general level of farming—by better cultivation combined with the use of increased quantities of lime and fertilizers. There was a greatly increased British output of nitrogen compounds and of lime, with increased imports of phosphate rock. These fertilizers were offered at low prices in order to encourage their use. Potash was the only fertilizer that was not freely available, and special measures had to be taken to restrict its use to specially deficient soils and to highly responsive crops. The inspection of farms by the war agricultural committees was tightened up; farms were classified as "A," "B" and "C," and the last group was kept under fairly constant supervision. A considerable number of inefficient farmers were deprived of their farms.

Fourth, much thought had to be given to the numbers of farm livestock that the land could maintain under the changed conditions. Apart from the large loss of grazing area and of hay meadow, there was a heavy reduction—from about 8,000,000 to about 3,000,000 tons—in imports of animal feeding stuffs. Dairy farmers, and also owners of high-class pedigree stock of all kinds were encouraged, by rather liberal allowances of feeding stuffs, to maintain or even to increase the number of their animals. Conversely, the reduction of commercial pig herds and poultry flocks was enforced by reducing food allowances. A further measure was the use of compulsory powers for the slaughter of poor and unhealthy cattle.

Finally, there was an intensive campaign for the utilization of many by-products. Surplus grass was converted into silage; considerable quantities of straw were converted into useful fodder by a new method of soda treatment; and there was a great development in the collection of town waste, both for stock feeding and for manure.

No official estimate was published in 1941 of the actual outcome of all these measures, but it is obvious that they led to a substantial increase in the output of food, and this despite the fact that there was a large transference of man power from agriculture to the armed forces. The loss was partly made good by the employment of women.

Seasonal conditions, on balance, were favourable. The winter, for the second successive year, was severe, especially in the north of England and throughout Scotland; the consequence was a small crop of lambs from mountain pastures. Spring was cold and dry, and there was an acute shortage of grass, even in the lowlands, during the early part of May. Spring frosts were severe in some areas, with the consequence of a poor fruit crop. The weather during early summer was, however, favourable and all crops were heavy. Hay was secured under excellent conditions. During July and August heavy rains occurred in the south, and these caused some damage to early grain crops; but conditions in September were favourable for harvest. The quantity of grain secured was the largest that Great Britain has ever produced, and most of the other essential crops were fully up to average.

British Empire.—The problem of the dominions remained one of marketing. The greater part of continental Europe, which was in need of large quantities of foodstuffs, was cut off from the world markets. Russia, Spain and Portugal were the only remaining customers. Moreover the length of the haul from Australasia greatly restricted the transport to Europe of the bulkier commodities such as wheat, apples and canned fruit. Third, there was a shortage of refrigerated cargo space, which restricted the amount of perishable food—butter, cheese and eggs especially—that could be carried through the tropics. Finally, there was a natural reluctance on the part of Britain to accept luxury articles such as empire wines.

Some of these problems, however, were on the way to partial solution. Thus Canada's surplus grain was increasingly being converted into bacon. Additional plants for making dried-milk powder were erected in Australia and New Zealand. An increasing proportion of fruit was exported in dried form. Some promising experimental shipments were made of other substitute products—clarified butterfat (which does not need refrigeration) in place of butter; boned meat in place of whole carcasses (to allow fuller use of refrigerator space) and even minced and dried meat which, carried in ordinary hold space, has a food value per ton about five times as high as that of meat in carcass form.

(J. A. S. W.)

For agricultural statistics of countries other than the U.S.A., *see* the subheading *Agriculture* in the articles on those countries, also the articles on various crops and agricultural products. Aguirre Cerda, Pedro (1879–1941), Chilean statesman, was born Feb. 6 in Los Andes, Chile. Educated at St. Felipe college and the Pedagogic institute, he taught at the army subofficers' academy in 1900 and began the practice of law in 1904. He was elected deputy to the Chilean

parliament in 1915 and was named minister of education and justice in 1918 and interior minister in 1920.

Aguirre Cerda became the candidate of a popular front coalition for president and was elected in 1938 by a slim 4,000-vote margin. A champion of social reform, he announced plans for a Chilean new deal to aid the "forgotten man," but the tragic earthquake of Jan. 1939, which razed 20 cities and killed 8,000, compelled him to delay his social legislation in order to speed reconstruction.

He had served less than half his term as president when he died in Moneda palace in Santiago, after a short illness, Nov. 25.

Air Conditioning.

The air-conditioning sales volume for 1941 again exceeded the volume for the previous year by a substantial margin, thus indicating a healthy growth of the industry and an increasing public acceptance for the benefits of air conditioning to comfort and health. This increased sales volume resulted largely from improved products and greater national income.

The first half of 1941 showed an abnormally high sales increase. Because of material shortages resulting from the national defense program, this rate of increase was not maintained during the second half of 1941 in comfort air-conditioning equipment, although the sale of air conditioning for industrial and process work was maintained at a high rate.

The United States continued to be the principal centre of all air-conditioning activity, although various portions of Latin America were making progress along air-conditioning lines. Air-conditioning developments in the nations at war were more or less shrouded in mystery, although there was indication that various modifications of a complete air-conditioning process had been adopted for certain air-raid shelters and for the blackout type of manufacturing plant.

Air-conditioning Technique.—During 1941 there were no radical improvements in the technique of air conditioning. However, during 1941 various detailed improvements in product design were made, particularly in the small portable type of room cooler and in the small packaged type of central plant winter air-conditioning unit.

Increased attention was given to the benefits of the small forced-circulation type of window ventilator for use in office, hotel and apartment rooms, as well as homes.

More compact, lower cost and generally reliable window ventilators were available.

National Defense.—The air-conditioning industry was called upon to make substantial contributions to the all-important program of national defense. These contributions applied first to manufacturing plants where for process or for blackout reasons the plant would be quite impractical without the use of air conditioning. Also, in the rapid expansion of housing facilities for defense industry areas, it was shown that small, compact packaged types of central plant winter air conditioners might be applied at costs equal to or lower than the costs of ordinary and less satisfactory heating systems, and with definite benefits to the occupants of the home.

Further, considerable confidential research was under way, working toward the improving of the various defense operations for utilizing one or more of the principles of air conditioning. All of this was in addition to the manufacture of primary defense equipment in the "gun, tank and plane" class.

Future of Air Conditioning.—It was indicated that the industry would continue in 1942 to make important contributions to national defense on essential equipment. This meant that 1942 sales figures would show a reduction in air conditioning of the purely comfort type, but a substantial increase in air conditioning as applied to defense housing and to industrial and process work. It was indicated that forced changes in plans and designs, due to certain material shortages, would in the long run produce benefits in cost reduction and improved performance which would give the purchaser more for his dollar. (*See* also PUBLIC HEALTH ENGINEERING.) (EL. HA.)

Air Forces of the World.

U.S. Army.—The year 1941 saw accelerated the greatest peacetime expansion of the army air forces in United States history. During the fiscal year 1939 congress appropriated $73,556,972; appropriation for the fiscal year 1940 was $243,631,388; for the fiscal year 1941 appropriation was $3,892,769,570.

The fiscal year 1941 was a marked increase above the 1940 program, begun in 1939 and calling for 5,500 aeroplanes under the 25-group program, including 5 heavy bombardment groups, 6 medium bombardment groups, 2 light bombardment groups, 2 pursuit fighter groups, 7 pursuit interceptor groups and 3 composite groups, with 4,663 officers and 43,337 enlisted men.

Between this and the 54-group program there was a jump to 41 combat groups, with 10,846 officers and 89,672 enlisted men. The first aviation objective followed, including 56 combat groups and 6 transport groups, with 13,575 officers and 145,000 enlisted men. This program embraced 6,004 aeroplanes; 4,006 combat types in organizations, 1,998 in reserve.

Orders were placed for aircraft far above stated requirements, to expand facilities and anticipate British needs and air force expansion. During 1941 the air corps ordered and requisitioned approximately 28,500 aeroplanes.

Pilot training rate was expanded to 30,000 a year and rate of training enlisted technicians to 100,000 annually. Technical schools were increased by facilities at Biloxi, Miss.; Wichita Falls, Tex.; and Ft. Logan, Colo. The month of June 1941 found these other schools: primary (civilian) 29; basic (air corps) 7; advanced (air corps) 11; and special 13, including technical, gunnery, navigation and bombardier.

With air power universally recognized as a determining factor in modern warfare in which "so many owed so much to so few," the war department gave the air forces distinctive status. An assistant secretary of war for air was appointed. Also appointed was a deputy chief of staff for air, in addition, chief of the army air forces, controlling the air force combat command (formerly GHQ air force) and the air corps. A new air council included the assistant secretary of war for air (ex-officio), chief of the army air forces (president), chief of the air force combat command, chief of the war plans division of the war department general staff and chief of the air corps.

Providing close air support for army ground units, 5 air support commands were created, including observation aviation, light bombers, dive bombers, photography planes, gliders and air transport for parachute troops. The 1st, 2nd, 3rd and 4th air support commands operate with the respective field armies, and the 5th with the armoured force. (*See* also ARMIES OF THE WORLD.)

(H. H. A.)

U.S. Navy.—The Naval Aeronautical organization on July 19, 1940, was authorized by U.S. congress to increase its strength to 15,000 aeroplanes.

During the fiscal year 1941 the bureau of aeronautics directed its efforts toward the early completion of this program. A parallel training and base facilities program was established to support the increased procurement plan.

At the end of the fiscal year, June 30, 1941, there were 3,956 aeroplanes on hand, with 6,054 on order.

All combat ships of the navy, with the exception of destroyers and submarines, carry a complement of aeroplanes, ranging in number from two or three on the battleships, to approximately 75 on each aircraft carrier.

The type of aircraft carried is determined by the mission of the surface ship to which it is attached. From the requirements of these missions, four basic types of aeroplanes have evolved:

1. The fighting plane, whose primary mission is attacking enemy aircraft with gunfire.
2. Torpedo and bombing planes, including the dive bomber, designed to attack heavy enemy vessels or shore bases.
3. Scouting and observation planes, the eyes of the fleet, designed with emphasis on speed, range, gunnery defense and communication facilities.
4. The patrol plane, the largest type of plane in service, is self-protecting and carries out long-range scouting flights.

Surface ships supporting aircraft were modernized in the light of lessons learned during the early months of World War II, and additional ships were added for the support of naval aircraft, including 18 aircraft carriers on hand, under construction or authorized.

The carriers in commission in 1941 were: the "Yorktown," "Enterprise," "Ranger," "Wasp," "Hornet," "Lexington" and "Saratoga."

Future carriers, in order of their construction, would be: the "Essex," "Bon Homme Richard," "Intrepid," "Kearsarge," "Franklin," "Hancock," "Cabot," "Bunker Hill," "Oriskany," "Randolph" and "Ticonderoga."

To expedite the training program, maximum use was made of existing facilities, and on March 18, 1941, a directive was issued for the additional shore stations required. Shore facilities of the naval air arm, as of Oct. 1941, comprised 29 naval air stations in commission and four under construction. In addition, 16 U.S. naval reserve aviation bases were in commission, providing elimination flight training for prospective naval aviation cadets.

The training of navy aircraft personnel necessarily was coordinated with procurement and expansion of shore facilities. In June 1940 the only existing naval aviation training centre was at Pensacola, Fla. Pilot entry rate was 100 students per month. By July 1941 the navy had three additional training stations at Jacksonville, Fla., Corpus Christi, Tex., and Miami, Fla., with a combined entry rate of 800 students per month directed at the goal of 17,000 trained pilots for naval aviation. The training of enlisted personnel, mechanics, metal smiths, ordnance men and radio men reached a rate of 12,000 men every four months.

Concurrent with the expansion program, experimentation in glider usage was conducted and legislation authorized a lighter-than-air program of 48 nonrigid airships with shore facilities.

Plane performance and design progressed, with emphasis on manoeuvrability, speed, range and armament protection. Effort in every field was expended to increase the general efficiency of naval aviation. (J. H. Ts.)

The World.[1]—*Russia.*—Throughout 1940 the theatre of action for air warfare was largely restricted to western Europe. With Russia inactive and with the late 1939 campaigns to the east completed, the entire strength of the German luftwaffe was thrown against the British Isles. That effort failed to win the war for Hitler. During 1941, as new fronts were established in an effort to accomplish what direct attack could not do, the war in the air spread over the entire world. As the year ended, the R.A.F. was in action against Mussolini's air force and the luftwaffe in North Africa; Russian fighters were beating off German bombing attacks from the Arctic ocean to the Black sea; British and American air patrols were sweeping the north Atlantic, and American and Japanese squadrons were fighting for air supremacy from Honolulu to Hongkong.

Comparative Air Force Strength of Chief Warring Powers*

(Combat Units)

Allies	No. of Planes	Axis	No. of Planes
United States	3,000–5,000	Germany	5,500–8,500
Great Britain	4,500–5,500	Japan	5,000?
Russia	?	Italy	1,500–3,000
China	100–200	Hungary	400–600
Netherlands Indies	500–600	Finland	200–300
		Bulgaria	100–300
		Rumania	500–700

Taken from *New York Times* of Dec. 14, 1941.
*Corrected for known losses up until Dec. 12.

Twice during 1941 the shifting pattern of international alliances upset the balance of air power. In June German aggression made Russia an active axis foe rather than acquiescent partner. In December Japan made its bid for supremacy in the Pacific. Interest was therefore focused on two air forces that previously had played only minor parts in the war in the air.

Russian aviation had been an enigma for many years. Few American or British observers were permitted more than a glimpse of its fields and factories. It was known that large numbers of aircraft had been built during the middle 1930s. It was known also that thousands of pilots and parachutists had been trained. Soviet planes and pilots put up a fair showing in Spain, but were ultimately overwhelmed by the superior numbers and performance of German and Italian squadrons.

It was generally believed, however, that the quality of the matériel and personnel was below par, and serious doubts existed as to the ability of soviet industry to turn out replacements on a scale commensurate with modern war.

But from the meagre accounts coming out of the Russian campaign up to Jan. 1, 1942, Russia's fighting squadrons were giving a good account of themselves. Germany obviously underestimated Russian air strength when it made up the timetables for its advance on Moscow and Leningrad. As usual, claims of losses on both sides may well be discounted. Germany claimed that Russia had lost more than 50% of its initial fighting strength. How much it cost the luftwaffe in the process was unknown, but it was certain that the campaign cut deeply into Hitler's first-line planes and pilots.

Although large numbers of soviet aeroplanes were obsolete in 1941, some of the newer fighter and bomber designs stacked up with those of the rest of the world. The latest fighters were reported to be in the 350-m.p.h. to 400-m.p.h. class. The new I-26 was said to resemble the British Spitfire in appearance and in performance. Other fighters included the two-place monoplane I-21 with two 1,300-h.p. engines, armed with two 20-mm. cannons and six machine guns; the single-seater I-20 with one 1,300-h.p. engine, one 20-mm. cannon and six guns; and the I-18 single-seater with a 1,250-h.p. engine and the same armament as the I-20. In reserve as second-line fighters were the I-16 and I-17 single-seaters of about 800-h.p. which were used in Spain and later on the Manchoukuoan border.

A number of dive bombers and medium bombers were built under American licences. A modification of the old Boeing P-12 fighter with a Russian-built Cyclone engine was fitted for dive bombing and a considerable number of American-built Vultee attack planes were modified for that purpose.

In the medium bomber field the Martin and Boeing influence was evident. Few details of performance were known, but photographs showed that these types were thoroughly modernized. They should have been able to perform with corresponding types of the luftwaffe. For example, the CKB-26 medium bomber with two 1,000-h.p. M-63 engines was in service with many squadrons. It could do about 250 m.p.h. and had a range of approximately 2,500 mi. with 1,000 lb. of bombs. A newer and sleeker-looking machine, the DB-3A, had two liquid-cooled engines of better than 1,000 h.p. It was used both as a medium bomber and as a two-place fighter. Performance details were lacking.

In heavy bombers, the soviet air force appeared to be deficient. It had a number of very large and very slow six-engine machines of a type long since outmoded. Some of them were almost as large as the American B-19 bomber. Some were equipped to transport light tanks. For many years the Russians had been interested in aircraft for extremely long ranges, as witness the several flights across the north pole to the United States, but few authoritative reports were forthcoming of concentrated raids by heavy Russian bombers against German industry.

Because of the necessity of defending thousands of miles of coast line, Russia had a large but unknown number of naval aircraft, mostly of small patrol types. Since 1930 a great deal of experience had been gained with these machines, as well as with land types, in arctic operations. There was no doubt that the soviet air forces had more experience in winter flying than any air force in the world—a factor that might carry considerable weight in the campaign against the Germans during the winter of 1941–42. It was well known that Russia had thousands of trained

[1]All assertions or opinions contained in this section of this article are the private ones of the writer and are not to be construed as official or reflecting the views of any government service.

paratroops and large numbers of troop transports, although no extensive use of this tactic had been reported. The soviets also pioneered in the transportation of troops by glider. But again, no actual demonstration of strength in this field had been made by the close of 1941.

Japan.—The sudden eruption of Japanese aggression in the Pacific focused attention on another air force about which comparatively little was known. In spite of the fact that Japan scored initial successes in surprise air attacks against Hawaii and the Philippines, there was no question but that its air forces, both naval and military, were second-rate. Some of its medium-class bombers were of reasonably modern design. The Nakajima 19s used by the army appeared to be in a class with American B-18s. The Mitsubishi Soyokaze twin-engine naval bombers showed a decided German Junkers (JU-86K) influence. Neither of these machines, however, was very fast—possibly 250 mi. an hour. Among the best of the bombers (a machine that probably was used against Manila from bases in Formosa and in China) the Mitsubishi 92 bore close resemblance to the Martin 166—long since considered obsolete by the U.S. army air forces. This machine had two 1,000-h.p. radial engines, and probably cruised at around 250 m.p.h.

Japanese light bombers, of which the Mitsubishi 97 was typical, were single-engine two-place monoplanes resembling closely the outmoded U.S. Northrop A-17 attack ship.

Whether or not the Japanese air forces had any large four-engine bombers was problematical. The Japanese government purchased the Douglas DC-4 commercial prototype and the manufacturing rights. A bomber version of this large machine might have been built, but no actual evidence came to hand. It was known, however, that the Japanese navy had a number of large four-engine flying boat patrol bombers, somewhat similar to earlier U.S. Sikorsky S-42 clippers. Ships of this type might have taken part in the bombing of Hawaii, although direct evidence was lacking.

As far as was known, Japan had no fighters that compared with modern British, German or American machines. Nothing like the Spitfires or Hurricanes or U.S. P-39s or P-40s appeared. The fighters operating from carrier decks were similar in appearance and probably in performance to machines that were designed about 1936. It would seem probable that shore-based fighter squadrons in Japan were equipped with more modern machines, but up to the end of 1941 no direct contact had been made with them. In view of alliances with Germany and Italy, it would be a fair assumption that new German designs or actual German and Italian aircraft had been supplied to the Japanese forces in Japan. It was well known that German officers were instructing Japanese squadrons in the latest fighting tactics.

In the first few days after the attack on Pearl Harbor it was popularly supposed that German pilots manned many of the Japanese aircraft. That assumption soon proved untenable. Although there was little doubt that the major strategy was mapped out on the Wilhelmstrasse, the actual execution was carried out by Japanese naval pilots in Japanese naval planes. Strategists had been prone to underrate Japanese aviation because of the comparatively poor showing that had been made in China. Possibly the contrast between performances in China and against U.S. possessions in the Pacific might be accounted for partly by the fact that Chinese operations were in the hands of the Japanese army, and the latter were conducted wholly by the navy. Technical training of Japanese personnel ranked with that of most navies of the world. It might be argued that their naval aviation was better than that of their army—only the future could prove or disprove the point.

Italy.—Italy's disastrous campaign in Greece and in north Africa in the latter half of 1940 cost Mussolini a high percentage of his air force. As a result, Italian air activity during 1941 was not outstanding. Army pilots were continuously engaged against the R.A.F. in Africa, and in late September, a mass torpedoplane attack against a large convoy in the Mediterranean was claimed by Rome to have been highly successful, but was discounted in London.

During 1941, however, Italian designers and builders were not idle. The country had some first-rate men and some first-rate plants. Indications were that a number of new fighters, bombers and torpedo carriers, of a calibre to be reckoned with, would appear on Italo-axis fronts in 1942.

The new fighters were largely in the "hush-hush" class. Photographs of only one or two came to the U.S.A. but they had all the earmarks of modernity with a strong Germanic flavour. The Reggione Re2001, for example, was a single-engine single-seater monoplane of excellent appearance. It exhibited the Italian trend away from radial air-cooled engines to the liquid-cooled in-line power plant for fighters. The ducted radiator treatment matched the best British or American practice. Certain new designs with extension shaft drives similar to those of the U.S. Bell Airacobra were rumoured. The general trend seemed to be toward relatively light single-seaters with great fire power.

In the bomber field, a number of new machines came out into the open. A few, like the Fiat B.S.A., were two-engined. Some, of which the Savoia-Machetti 84 and Piaggio 23R were typical, clung to the three-engine arrangement which had almost disappeared elsewhere. Four-engine "heavies" which resembled U.S. Boeing Flying Fortresses were in production. The Piaggio P-50 and P-108 were in this class. They were fitted with engines in the 1,200- to 1,350-h.p. range. A secret twin-engine dive bomber, probably similar to the Breda 88, was said to be under test.

The Italian navy was taught a costly lesson by the British at Taranto. After that disaster it redoubled its efforts in the development of torpedo-carrying seaplanes. Several new types were in the offing—fast ships capable of carrying one or two torpedoes for long distances. The Fiat RS-14 was a twin-engine torpedo bomber. The Savoia-Machetti SM-94 had three engines.

With Russia's air forces barely holding their own on the eastern front, and with the weight of fresh Italian and Japanese squadrons on the axis side of the balance, increased production of better planes for the Allies was of paramount importance. The war might be won or lost in the aircraft factories as much as in the air.

Great Britain.—In the early weeks of 1941, after a long series of destructive raids against British industry, there was some reasonable doubt as to Britain's ability to maintain aircraft production rates in competition with the German factories. Two things turned the tide. One, the relief of pressure from air attack due to the opening of the Russian front in June, and two, the increasing weight of American industry behind Britain's air effort. In the early months of 1941 that effect was possibly more psychological than real, but as the year grew older, increasing numbers of American-built planes appeared on R.A.F. aerodromes from the Scottish moors to the sands of North Africa. Day and night, winter and summer of 1941, an ever-growing stream of bombers winged across the north Atlantic, and every convoy from American shores for British possessions carried, in its holds and on its decks, replacements for R.A.F. squadrons.

The list of U.S.-built aircraft serving with the R.A.F. in 1941 is impressive. In addition to hundreds of trainers of all types furnished to Canada and to Britain, the following were on R.A.F. rosters: Fighters—Bell Airacobra, Brewster Buffalo, Curtiss Kittyhawk, Curtiss Tomahawk, Curtiss Mohawk, Douglas Havoc, Grumman Martlet, Lockheed Lightning and North American Mustang. Bombers—Boeing Flying Fortress (four-engine), Brewster Bermuda, Consolidated Catalina (flying boat), Consolidated Lib-

erator (four-engine), Curtiss Cleveland, Douglas Digby, Douglas Boston, Douglas Nomad, Lockheed Hudson, Martin Maryland, Martin Baltimore, Vega Ventura and Vought Chesapeake. Practically all of these machines were counterparts of production types for the U.S. army and navy. They were of the latest U.S. production designs and were fitted out with the best equipment U.S. factories knew how to build. The timing of the Japanese attack against the United States in early December was undoubtedly set by Germany in an effort to stem the flow of aeroplanes and other supplies to Britain after the failure of the submarine and aerial blockade to pinch them off in the Atlantic. Before the outbreak of the war in the Pacific, statistically minded aviation observers estimated that the combined production rates of the United States and Great Britain in aeroplanes and engines would be in a fair way to match the probable output of axis factories by the spring of 1942.

This did not mean necessarily that the total air strength of the Anglo-American air forces would then be at parity with the axis powers. It must be remembered that Germany and Italy (and even Japan) had secured a lead of several years, both in planes and pilots. It seemed likely, however, that with the acceleration in U.S. industry, and assuming that the German situation did not change materially, the fall of 1942, or at latest, the spring of 1943, should see air superiority shifted to the side of the Allies.

Whether this shift would occur sooner or later depended to a great extent upon the situation in Russia. In spite of the fact that Russia was an ally for more than six months, very little was known of its potential contributions to the production picture. Whether or not the factories were in a position to replace soviet losses without drawing too heavily upon the already overtaxed production facilities of Britain and America remained to be seen. It was, perhaps, too much on the optimistic side to expect that any surplusage of machines or motors would be available for Allied use. The most that could be hoped was that Russian industry could replace its own losses.

Losses.—Statements of losses to enemy ships or aircraft during wartime are always subject to considerable question. In mass air fighting it is extremely difficult to keep track of enemy planes shot down. There is always a tendency to overestimate on one side and to understate on the other. Experience has indicated, however, that such statements by the British are reasonably reliable. With these reservations in mind then, the following are the figures given out by the British air ministry covering losses in combat and by anti-aircraft fire from the beginning of the war in Sept. 1939 to Nov. 9, 1941 (not including the losses in the Russian campaign):

Aeroplanes lost by the axis air forces	7,458
Aeroplanes lost by the imperial air forces	3,596
Personnel losses by the axis air forces	20,565
Personnel losses by the imperial air forces	10,295

Performance.—Next to high output, improved performance for all types of aircraft was the continuous objective of designers on both sides. But they were in 1941 approaching performance ceilings that were going to be extremely difficult to break through. Fighter speeds, for example, had been pushed slowly upward by the application of power and more power, but seemed by the end of 1941 to be levelling off at somewhere over 400 mi. an hour. Until some radical departure in design was to put in an appearance, speeds much above that figure would probably cost too much in engine power to be practical for military aircraft. In spite of the fact that the output of the best aeroplane engines advanced after 1939 from 1,200 to close to 2,000 h.p., the advance in speeds was not anything like commensurate. Most of the power went for carrying more and bigger guns, more ammunition and better armour.

The big drive was to fly at higher levels. Where air strategists in 1940 mapped out campaigns at 25,000 ft., the talk in 1941 was of 35,000 to 40,000 ft. Here again physical limitations impose tremendous difficulties. With air pressures at 40,000 ft. only one-quarter of sea-level values, the problem of supercharging men and motors is complicated and difficult. In addition, the effects of low pressures and low temperatures on the operation of ignition systems, radio sets, machine guns and other auxiliaries bring up new problems that have heretofore been dormant.

In this connection, the behaviour of American-built Flying Fortresses in the hands of the British was a surprise, both to the R.A.F. and to the Germans. Thanks to the turbo-superchargers with which these four-engine Boeing bombers were equipped, the British were able to conduct a number of effective daylight raids against German industrial centres at levels generally out of reach of anti-aircraft fire or of most interceptor fighters.

High altitude bombing caused a noticeable shift in thinking with respect to interceptors. Heretofore, with bombers unable to get up over 20,000 or 25,000 ft., it was relatively easy to build heavily armed and heavily armoured interceptors that could easily outmanoeuvre them. Such machines, however, are at a decided disadvantage at 35,000-ft. levels. The latest single-engine Messerschmitt 109F was lightened by the removal of all armour plate and by reducing the armament to one cannon and two machine guns. A lightly armed aeroplane that will manoeuvre well at 35,000 ft. is superior to a more heavily armed machine that is barely able to fly at such altitudes. The same trend was noted with respect to Italy's fighters.

Bombers.—Bomber design in Britain shifted definitely toward big types with loads and ranges far in excess of the Wellingtons, Whitleys and Hampdens with which the R.A.F. started the war. During 1941 the four-motored Short Stirlings and Handley-Page Halifax machines appeared in quantity in the squadrons of the bomber commands. Later, the Avro Manchesters, with a pair of 24-cylinder Rolls-Royce Vulture engines reported for active duty. These were supplemented by increasing numbers of U.S.-built Boeing Flying Fortresses and Consolidated Liberators delivered via the north Atlantic route. It was with such machines that the R.A.F., come the spring of 1942, expected to overcome the handicap of distance which separates British aerodromes from German industrial centres. All signs pointed to intensive preparation for assuming the offensive and for carrying the war in the air deep into German territory.

Fighters.—Nothing radically new appeared during 1941 in the fighter class in any of the belligerent countries. Spitfires and Hurricanes in improved models continued to implement R.A.F. fighter squadrons. Only one of the twin-engine British interceptors that were forecast in the fall of 1940 as antidotes for the ME-110s put in an appearance—the Bristol Beaufighter. This machine had enough range to convoy bombers to Berlin and return. The best night fighter of the R.A.F. proved to be the U.S. Douglas Havoc. This machine was a modification of United States A-20 light bomber, with a noseful of guns substituted for the original bombing equipment.

The Spitfires and Hurricanes of late 1941 were far more powerful weapons than their 1940 predecessors. Fire power was increased to the limit of practical wing loadings. Hurricanes appeared late in 1941 that carried as many as four 20-mm. cannons mounted in their wings. In fact, few fighters were being considered for production carrying fewer than 10 or 12 wing-mounted 30 to 50 calibre guns, or the equivalent in cannons. This heavy armament was supplemented in some cases by the addition of two 250-lb. bombs slung beneath wings. Squadrons of Hurricanes with 12 machine guns and 2 bombs were used against the German-held channel ports in mid-December. These machines, although too heavily loaded to be effective as fighters during the cross-channel flight, regained their normal fighting characteristics once they unloaded their bombs on targets on the French coast.

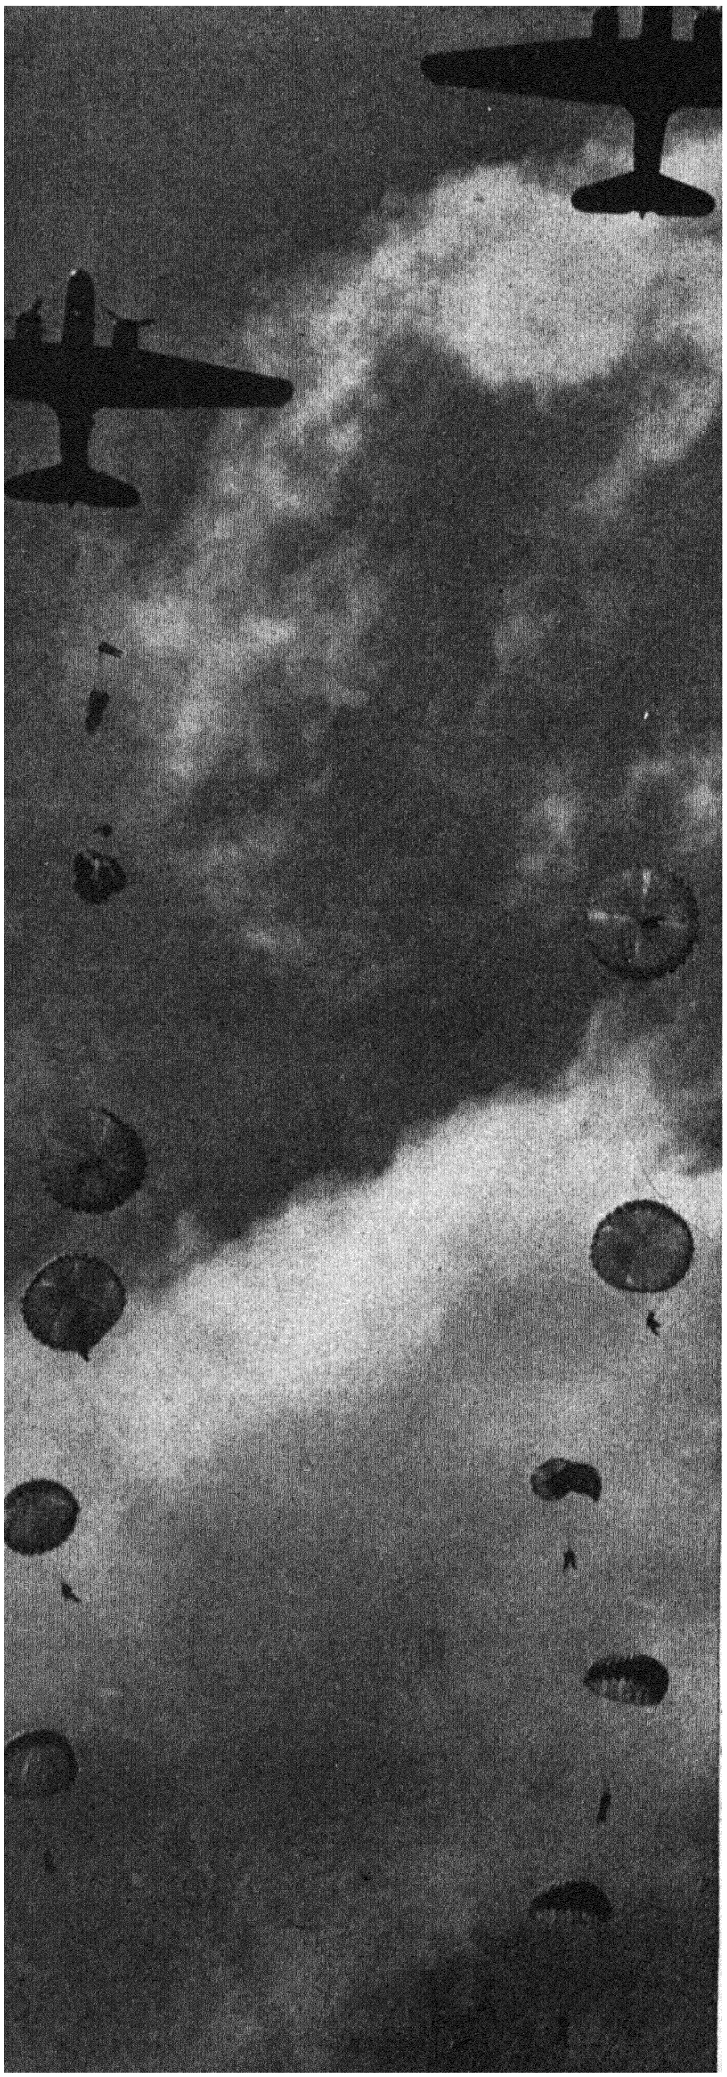
Germany carried on with improved models of the Messerschmitt 110 two-engine fighter that first appeared in quantities in 1940, and with the lightened version of the original single-seater (Me-109F) mentioned above. New and more radical types were rumoured in the making, but had not appeared on any front at year's end.

Commerce Raiders.—Germany continued the use of big bombers as commerce raiders far out at sea. The Focke-Wulf Kurier with four 1,000-h.p. engines was supplemented for such work by the four-engine Bloehm and Voss seaplane bombers and the newer twin-engine Heinkel 110 torpedo carrier. It was claimed that 3,000,000 tons out of the 13,500,000 tons of British shipping that had been sent to the bottom since the beginning of the war were accounted for by the *luftwaffe*. Some of these sinkings took place as much as 1,000 mi. off shore. As an antidote, British and American aircraft were convoying across the Atlantic route from Canada to Britain. Both shore-based patrol aircraft (operating from Greenland and Iceland) and shipboard fighters were being employed. It was rumoured that certain British merchantmen were fitted with catapults from which single-seat fighters might be launched when attacks were made by the German bombers.

"Ersatz" Aircraft.—There was a popular notion that German aircraft were inferior to British and American machines because of Germany's extensive use of "ersatz" materials. That this was merely a form of wishful thinking was proved over and over again by detailed examination of captured German aircraft and engines. Some of the materials employed were not those that could be conventionally specified, but in most instances the substitute material was found to be the equal, if not better, than the non-German articles. Flying equipment captured on all fronts down through the end of 1941 was of excellent design and construction. All accessories, equipment, instrumentation, radio, etc., were up to standards that were acceptable elsewhere. Tests on captured engines indicated performance, reliability and length of life on a par with other engines of the same class. Fuel and oil from the tanks of German aeroplanes were analyzed and found to be perfectly adequate for the job at hand. There was no indication that quality of German aircraft suffered for lack of any essential materials.

As a matter of fact, there were indications that German research had uncovered new fuels and materials that might be better than those considered standard. For example, reports from British fighter pilots, as well as the evidence on captured German fighters, indicated that special emergency fuel in small quantities was carried that might be used to give a temporary burst of power to enable the fighter either to overtake or to run away from an opponent. Also, there was some reason to believe that assisted takeoffs for heavy bombers by some form of rocket motor was used on an experimental scale. It was known, of course, that some experimental work along these lines was conducted in Germany several years before the war. In this connection, several reports came out of Germany, Britain and Italy, of new types of aircraft to operate at high speeds at high altitudes on rocket or jet propulsion methods. Few details were available in 1941.

Icing.—All belligerents flying in Europe during the winter months had difficulty with icing of aircraft and engines. Ice is frequently encountered on the north Atlantic ferry routes. Several planes were lost on transatlantic delivery flights, and on one occasion, 37 British bombers were lost over the North sea in the course of a long-range raid into Germany, probably because of icing. A great deal of effort was being made on both sides to eliminate this hazard. The Germans were probably having less trouble from icing of engines because of the widespread use of direct fuel injection in place of the more common carburetion. They also made considerable progress in the direction of controlling icing on wings and tail surfaces by the application of heat from the engine exhausts—a technique that was under intensive study in the U.S.



Anti-aircraft Protection.—Although no startling new methods or devices for anti-aircraft protection in the way of guns, balloon barrages, searchlights, etc., came into use during 1941, great strides were made in methods of detecting the approach of hostile aircraft. The older aural listening devices gave way to radio detection methods that were very accurate and which covered far greater distances. By the use of these detectors, supplemented by reports from ground observers, the British developed an elaborate and successful control system which permitted the plotting of the courses of aircraft approaching the British Isles, and from which orders were issued to aerodromes all over Britain for the sending up of interceptors and fighters. This system, together with the improved arming and performance of Britain's night fighters, was an important factor in reducing the severity of German night raiding over Great Britain.

Tactical Innovations.—If technical surprises were few, some tactical innovations were startling and of considerable significance. The use of paratroops was already well established before the end of 1940. Key points in Norway, Holland and Belgium were taken by the sky troops. There had been persistent rumours, however, of possible invasion of Great Britain by transporting large numbers of troops in glider trains. None such appeared over the English channel, but the taking of Crete might well have been a dress rehearsal for an attempt in that direction. Not only were paratroops used in large numbers, but for the first time troop-carrying gliders were towed over an objective and landed successfully on enemy terrain. The machines used carried eight to ten fully armed men and had a wing span of some 80-odd feet. They were of steel and plywood construction and were stout enough to be landed safely on rough ground. Trains of three to five of them were towed behind JU-52 transports. How many hundreds of troops were put down on Crete in this manner was not definitely known, but the manoeuvre was successful enough to cause every air force in the world, including that of the United States, to make a hasty reassessment of the value of motorless aircraft as a military weapon.

Air Power v. Sea Power.—However, a series of events of world-shaking importance with respect to aviation took place in the closing months of 1941. For the first time in the history of aviation, the proponents of air power *versus* sea power could point to definite examples to prove their arguments, rather than having to rely entirely on theoretical considerations. The number of capital ships sunk by aerial bombardment, both in the open sea and while lying in harbours, was not fully known. The British success against the Italian navy at Taranto was only a beginning. The toll was rising steadily. Although the German battleship "Bismarck" was sunk by naval action, it was hunted down and brought to bay by aircraft. Out of a clear sky, Japanese airmen dropped into Pearl Harbor and inflicted losses on the U.S. Pacific fleet that were not, up to Jan. 1, 1942, fully evaluated in public. Some three days later, the English-speaking world was plunged into gloom by the destruction of the British warships "Repulse" and "Prince of Wales" when they were caught off Singapore without air protection. Naval people everywhere who had counted on the invulnerability of modern battleships had to face the uncomfortable fact that no surface vessel could fight off, without adequate aerial protection, a determined assault by large numbers of bombers and torpedo carriers determined to destroy it at any cost.

Gen. William Mitchell, who resigned from the U.S. army air corps in the middle '20s as a result of his unorthodox opinions, may not have been entirely right in claiming absolute superiority for air power over naval power. There is little doubt, however, that the lessons of 1941 were having a profound effect on naval thinking and naval tactics all over the world. Airports and Flying Fields.

Transportation and civilization have always advanced hand in hand, and United States engineering genius has always played a large part in improving transport facilities. In 1941, however, that genius was directed toward war, another world war, with the aeroplane its chief weapon. Airports in the U.S., far from being solely a factor in the nation's commercial development, became a vital factor in its national defense. Each civil airport, whether small or large, must be considered a potential military airport in time of war. Thus, every consideration must be given to its utility and adaptability to war. Scientific aids to flight which had been developed were being improved under emergency pressure.

In order to provide the nation with enough adequate airports from which planes may defend it in case of attack, $40,000,000 was appropriated for airports in the 1941 budget, and for 1942 an additional appropriation of $94,977,750 was made by congress to the Civil Aeronautics administration. This airport construction program, while closely co-ordinated with defense efforts, was of double value as an investment for it not only met an im-

PARACHUTE TROOPS of Camp Benning, Ga. dropping at regular intervals from U.S. army transport planes. By the fall of 1941 the number of such troops had grown from 48 to more than 4,000

mediate and urgent defense need, but also represented a permanent contribution to aviation in general.

Construction or improvement projects were to be conducted on 288 airports in the United States during 1941-42. These locations involved a total estimated expenditure of $80,810,110, of which $53,409,800 would be spent on 26 locations in the initial program but not in 1941 placed under construction, and 149 new locations in the continental United States. New locations mean those not heretofore included in the Civil Aeronautics administration program. A total of $18,968,871 was to go toward continuing work on 113 other projects in the United States started in the initial program authorized in Oct. 1940. It was anticipated that all work would be completed during the early part of 1942. In the over-all Civil Aeronautics administration airport program which began Oct. 1940, completion of this program would mean that the national total of airports would be increased by 43 class 4, 246 class 3, 14 class 2, and 2 seaplane ramps as a result of the Civil Aeronautics administration program. Class ratings are by runway lengths, class 1 having runways of 2,500 ft. or less; class 2, 2,500 ft. to 3,500 ft.; class 3, 3,500 ft. to 4,500 ft.; and class 4, 4,500 ft. or more.

Airport construction and improvement projects under the supervision of the Civil Aeronautics administration were limited to airports owned by local governmental authorities. The work undertaken on these airports was restricted to the development of landing facilities. All other improvements, including hangars and other buildings, must be done by local enterprises or local government. The airports must be operated in the general public interest, must remain in public ownership, and local government must agree to maintain and operate them.

Federal Airways System of the United States.—Under the stimulus of national defense, the Civil Aeronautics administration continued its rapid expansion of the federal airways system during the fiscal year 1941.

As of July 1, 1941, the total mileage of lighted operating airways in the United States had risen to 30,913 mi. There were 1,945 mi. of airways under construction and 921 mi. under survey. Other indications of the progress made in this direction are the following figures for air navigation facilities in operation as of July 1, 1941: 2,276 airway beacons, 280 intermediate landing fields, 29 lighted airports maintained by the Civil Aeronautics administration, 114 full-power radio stations, 139 medium-power radio range and communication stations, 39 low-power radio range and communication stations, 38 nondirectional radio marker stations, 118 ultra-high frequency fan markers and 2 modified Z-type markers.

[2]Lighted airport: boundary and beacon and/or floodlights.

CONTROL TOWER of the National airport at Washington, D.C., most modern in the world at the time of the airport's opening June 16, 1941. It has radio receivers for each airline using the field

Over a network of 13,292 mi. of teletype wires were transmitted instructions and information needed for the orderly direction of airways traffic from 133 traffic control stations. Invaluable weather information was supplied from 414 weather reporting stations, with a teletype mileage of 29,422 mi.

Traffic along this vast chain also must be guided 24 hr. a day, a job that requires the unceasing vigilance of more than 3,000 employees and costs more than $1,500,000 a month to maintain.

The major development in 1941 was the establishment of ultra-high frequency radio ranges and radio landing systems at various points throughout the country. Congress appropriated $2,477,000 to the Civil Aeronautics administration for this purpose. The New York-Chicago airway was the first link in what the Civil Aeronautics administration technicians believe would be the eventual conversion of the entire 35,000 mi. of federal airways from intermediate frequencies in the 200-400 kilocycle band to ultra-high frequencies between 119,000 and 126,000 kilocycles. The utilization of ultra-high frequency radio waves not only eliminates interruptions due to static interference inherent in the low frequencies, but assures uniformity of signal strength in the pilot's headphones. (E. M. E.)

Air Races. The spreading war conditions and governmental acquisition of most aeroplane production lines, reduced civilian air races throughout the world to a new low. Naturally European countries had no air races scheduled at all and even in the United States, not at war until almost the end of 1941, numerous air race events were cancelled. Chief among the annual races thus postponed for the duration, was the 1941 National Air races which for a score of years before had been a world-famous classic. The Bernarr Macfadden Trophy race also had to be called off. However, this was the one event whose cancellation was not due to the unsettled world conditions, but rather to unsettled weather.

Other air race attractions which were temporarily shelved included the Firestone Trophy race for aerial flivvers; the Colonel Batista Cup race for aerobatics; and the Culver Trophy races in California.

One event for women, a 25-mile race at Miami, Fla., was won by Virginia Snodgrass of Waterloo, Ia. She stepped up her machine to 104.035 miles per hour. (T. J. D.)

Air Raid Shelters. Public and domestic air raid shelters are provided in Great Britain by local authorities under the statutory powers conferred upon them by the Air Raid Precautions act 1937 and by the Civil Defence act 1939. The latter act also places certain duties on the owners or occupiers of factories, commercial buildings and mines employing more than 50 persons to provide shelter of a standard not less than that of the code referred to in section 13 of the act.

These acts are administered by the minister of home security. The responsibility for the execution of the work rests upon the local authority in respect of public and domestic shelters, and upon the owners or occupiers of factories, commercial buildings and mines.

Domestic shelter was originally provided free by the local authority on a grant-aided basis for all persons whose income was less than £250 per annum. Persons with higher incomes were expected to provide shelter for themselves. Domestic shelter was in 1941 provided as far as possible for persons whose income was less than £350 per annum, and the cost was reimbursed in full to the local authority.

The conception before the war was that the populace should be dispersed to the maximum possible extent, taking refuge in their own homes and at their work. Public shelter was intended only for those caught by a raid out of reach of home and place of work.

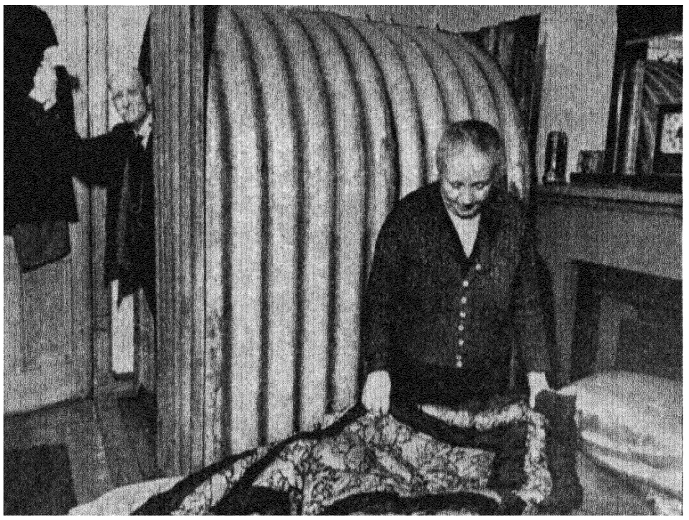
Experience of raids had shown beyond question the value of dispersal and while daylight raids were frequent the original system of shelter was satisfactory. The defeat of the day raids and the adoption of night bombing, however, led to a demand for dormitory shelter in the more vulnerable towns. Both public and domestic shelter which was only designed for short periods of occupation, therefore, had to be remodelled to provide dormitory accommodation by the provision of suitable bunks, lighting, heating, etc. Experience and research led to modifications in the design of shelters.

It was decided that deep or bombproof shelters should not be provided, the chief reasons being the impossibility of providing such shelter for all and the obvious undesirability of everyone going to ground during raiding. In the absence of adequate data it was decided that shelter should provide protection against blast, splinters and debris and the standard requirements were set out in the code referred to above. The shelters so constructed in the main stood up to bombs at closer range than their design provided for, but experience indicated that the earth waves set up by a bomb exploding after penetrating the ground led to more failures of shelters than any other cause, and shelters were redesigned to meet these effects and existing shelters modified accordingly.

The first domestic shelter to be designed, manufactured and issued by the government was the "Anderson" shelter. This consisted of corrugated iron sheeting upon a light angle-iron frame sunk three or four feet into the ground and covered with earth as a protection against splinters.

This shelter proved its value abundantly and, moreover, owing to its ductile properties, withstood the effect of the earth waves from bombs so close that the shelter was on the very edge of the crater and sometimes even closer.

For both domestic and public shelter, basements were also largely used. This form of shelter was popular as there was a tendency among many people to go to ground in air raids. The roofs of such basements were shored to prevent their collapse under the debris of the building above. Here again the design of the shoring was modified to meet the effects of earth shock.



ANDERSON AIR-RAID SHELTER installed in the bedroom of a private home in Glasgow, Scotland

A large proportion of the domestic and public shelter provided was brick and concrete structures, the designs of which were revised from time to time in the light of actual bombing and experiment.

Experience also showed that the protection against splinters and blast afforded by the average dwelling house is greater than was expected and that the chief danger therein is from debris due to collapse. This and the desire to provide shelter in the home in pursuance of the policy of dispersal led to the adoption of an indoor shelter designed to protect the shelterers against debris. The "Morrison" shelter, which consists of a strong steel framework supporting a steel table top and having a spring mattress, was issued in large quantities and proved its value in saving life, many persons having been rescued uninjured from houses which have collapsed on the shelter.

Public shelter was also provided in trenches, railway arches and disused tunnels. Trenches were the first type to be provided, the best being those lined with *in-situ* reinforced concrete. While trenches have of course been immune from splinters, blast and debris, except from a direct hit, they have been liable to damage from earth shock and steps were taken to strengthen them.

Experience indicated the value of modern fully framed buildings of reinforced concrete or steel, particularly the latter. Their resistance to collapse under even direct hits makes them eminently suitable for shelter. Wherever possible such buildings were used for shelter purposes.

Mention has been made of the use of existing tunnels as shelters. Many of these and old quarry workings, such as the Chislehurst caves, were adopted as shelters by the public without authority. Some of those so adopted were, unlike the Chislehurst caves, by no means bombproof and the calamity risk in the event of penetration was, of course, serious. Wherever suitable tunnels existed opportunity was taken to render them safe.

In London the stations of the tube railways were thrown open to the public for shelter when night raiding was heavy. Bunks and other amenities were provided.

Additional tube shelters were also being prepared against future emergencies by constructing portions of tube railways on the lines of future railway extension, some of which were ready for occupation in 1941. The provision of shelter was throughout hampered by the shortage of suitable material or of labour, but at the end of 1941 there was shelter accommodation for about 21,-

000,000 people in public and domestic shelter in addition to shelter provided by householders at their own expense and the shelter provided in factories, commercial buildings and mines. For organization against air raids in the U.S.A., *see* CIVILIAN DEFENSE, OFFICE OF. (A. M. R.)

A.L.A.: *see* AMERICAN LIBRARY ASSOCIATION.

Alabama. Alabama is one of the "deep south" states of the United States, admitted to the union 1819. Area, 51,609 sq.mi.; pop. (1940) 2,832,961. Capital, Montgomery (78,084). Cities with larger population were Birmingham (267,583) and Mobile (78,720). Of the state's population in 1940, 855,941 were urban, or 30.2%. There were, in 1940, 1,847,850 whites; 983,290 Negroes; 574 of other races; 2,821,004 native-born; 11,957 foreign-born; 47.2% of the total population was rural.

History.—Chief officers of the state in 1941, elected for service beginning Jan. 16, 1939 were: governor, Frank M. Dixon; lieutenant governor, A. A. Carmichael; state auditor, Howell Turner; secretary of state, John Brandon; state treasurer, C. E. McCall; attorney general, T. S. Lawson; superintendent of education, A. H. Collins; commissioner of agriculture and industries, J. H. Paterson.

Education.—A well defined system of elementary and high schools and colleges for both races is maintained. Elementary education is free between the ages of 6 and 21, and compulsory between the ages of 8 and 16. State appropriations in 1941 amounted to $14,795,041. Total revenues from all sources were $24,910,789. Illiteracy among whites between 10 and 20 years was 1.9%, Negroes 2.6%. There are seven state-supported institutions of higher education for whites and three for Negroes. Several colleges are maintained by the Methodists, Baptists and Catholics.

Charities and Correction.—The state supports many philanthropic and penal institutions: institutions for the deaf and blind of both races; hospitals for the insane of both races; a school for feeble-minded children; training schools for wayward white boys and girls; and a reformatory school for Negro boys, etc.

Banking and Finance.—In 1941 there were 66 national banks with capital stock, surplus and undivided profits of $50,462,000, deposits of $233,731,000 and total assets of $268,659,000; 151 state banks with a capital stock surplus and undivided profits of $22,224,499, deposits of $96,320,940 and total assets of $111,644,594. Revenue sources include a property tax, income tax, sales tax, privilege taxes and levies on gasoline, tobacco, beer and liquor. Receipts for the fiscal year 1939–40 were $66,128,786; disbursements, $65,046,810; state debt, $64,703,000.

Agriculture.—The total income of farmers in Alabama in 1940 was $115,463,000, divided as follows: cash income from crops, $62,006,000; cash income from livestock, $27,606,000; government payments, $25,851,000. In 1939 farm lands and buildings were valued at $408,782,488.

Table I.—*Leading Agricultural Products of Alabama, 1941 and 1940*

Crop	1941	1940
Corn, bu.	50,580,000	43,450,000
Oats, bu.	4,875,000	3,000,000
Cotton, bales	768,000	770,000
Potatoes, bu.	5,400,000	4,176,000
Peanuts, lb.	210,000,000	205,800,000
Tame and wild hay, tons	747,000	636,000
Tobacco, lb.	362,000	415,000

Table II.—*Principal Mineral Products of Alabama, 1939 and 1938*

Mineral	Value, 1939	Value, 1938
Pig iron	$43,902,681	$29,190,091
Coal	27,708,000	26,769,000
Coke	10,917,550	9,888,292
Iron ore	9,971,024	7,341,620
Cement	6,690,765	6,114,240
Stone	2,516,584	1,809,379
Clay products	2,306,712	1,487,067

Manufacturing.—In 1939 there were 2,052 manufacturing establishments hiring 126,215 workers and producing goods valued at $574,670,690. The leading manufactures were cotton textiles (valued at about $92,000,000; spindles in operation, 1,835,909), iron and steel and electricity. Corporation and municipal production of electricity amounted to about 900,000 h.p., and the TVA plants were capable of producing slightly more. There were more than 6,000 mi. of rural electric lines. Other important industries: lumber, blast furnace products, cast iron pipes and fittings, coke oven products, cotton-seed oil and meal, paper, aluminum, cement, chemicals, fertilizers, meat packing and shipbuilding. War demands caused expansion of old industries and the rise of new industries, such as powder manufacturing, in 1941.

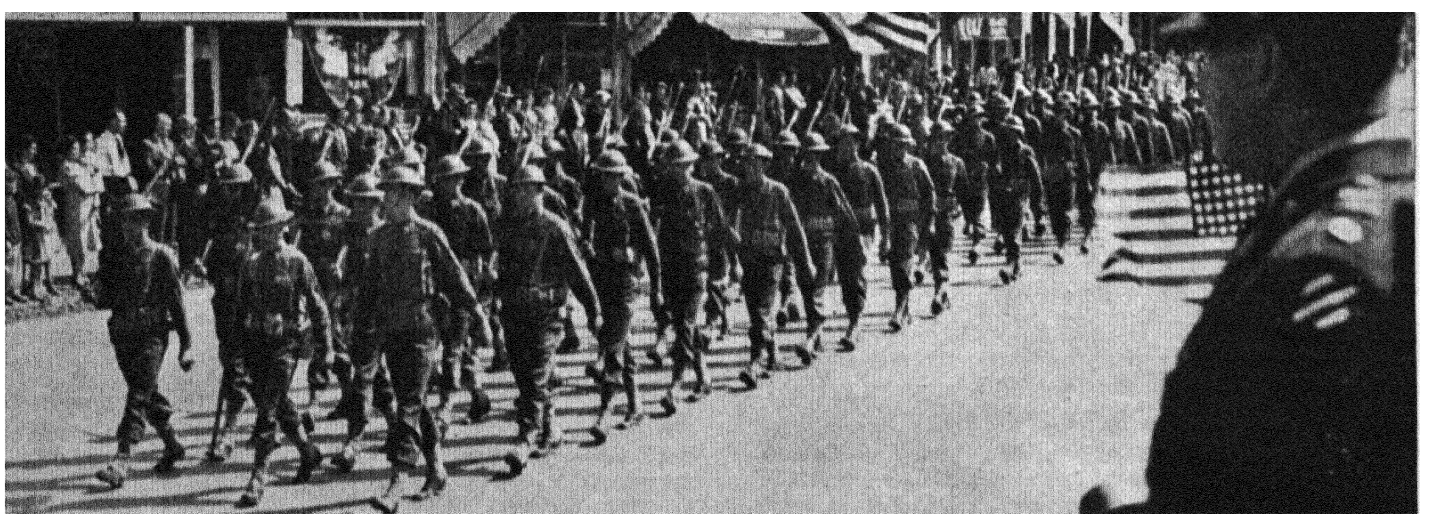
Mineral Production.—The total value of Alabama's mineral production in 1939 was $54,124,382; in 1938 it was $46,296,293. (A. B. Mo.; X.)

Alaska. Alaska, one of the two incorporated territories of the United States, 586,400 sq.mi. in extent, approximately one-fifth of the area of the 48 states, lies between the meridians 130° W. longitude and 173° E. longitude and between the parallels of 51° and 72° N. latitude. It is bounded on the north by the Arctic ocean, on the west by the Arctic ocean, Bering strait and Bering sea, on the south and southwest by the Pacific ocean, and on the east by Canada. The eastern boundary from the Arctic ocean to the Pacific in the neighbourhood of Mt. St. Elias is the 141st meridian; thence eastward to Portland canal the boundary is irregular but runs approximately parallel to the shore at a distance some 30 mi. inland.

In the year 1941, the territory reached an all-time high in population. The 1940 census (actually taken in Alaska Oct. 1, 1939, six months earlier than in the states) showed a total population of 72,524—an increase of 22.3% over the 1930 figure of 59,278 and substantially higher than the previous high in 1910 of 64,356. The taking of the census, however, preceded the inauguration of a far-flung national defense program in Alaska, which by the end of the calendar year 1941 approached $200,000,000. Not counting the troops stationed in Alaska, it is conservatively estimated that the population of the territory at the end of 1941 exceeded 80,000.

History.—Military and naval construction, begun in 1940, was greatly increased in 1941 and included the establishment, with the navy posts at Sitka, Kodiak and Dutch Harbor, of army posts respectively named Fort Ray, Fort Greeley and Fort Mears. A

THE FOURTH OF JULY, 1941, was celebrated in Anchorage, Alaska with a parade of newly-arrived U.S. troops



new post at Seward, southern terminus of the Alaska railroad, was named Fort Raymond—all these after army officers who had rendered distinguished service in the territory in earlier days. The seat of the Alaska defense forces at Fort Richardson, near Anchorage, was put under the command of a major general, with a brigadier in direct command of Fort Richardson itself. A great program of military and commercial airports and flying fields was also well under way, with major fields at Annette island—to serve Ketchikan, the southern gateway to the territory—at Juneau, Yakutat, Cordova, Seward, Bethel, Nome, East Ruby, Big Delta and Moose Creek, just west of the Alaska-Yukon territory boundary near the Tanana river. The construction on Ladd field near Fairbanks as an experimental station for fliers was completed. Commercial radio-beam stations, previously lacking in Alaska, were likewise installed. An important by-product of the defense program was the construction begun and well under way in 1941, of a trunk highway from Palmer to Copper Center connecting the Anchorage and Fairbanks system of roads and making a total central road network in Alaska of 1,392½ mi. The territorial legislature, convening in the spring of 1941, enacted for the first time a territorial traffic law.

Commerce.—The salmon run in southeastern Alaska during the 1941 season was unprecedented in size. For the fiscal year ending June 30, 1940 gold production also reached unprecedented levels; namely, $26,178,000. Tourist travel was impaired by the requirements of defense personnel and the withdrawal of certain steamers for defense purposes elsewhere. The year 1941 was the most prosperous year in Alaska's history. The defense program brought great activity throughout the territory, and wages soared to unprecedented heights. (E. GRU.)

Alaskan Highway: *see* ROADS AND HIGHWAYS.

Albania. A kingdom, united with the Italian empire, in the western part of the Balkan peninsula. Area, 10,629 sq.mi.; population (census 1930) 1,003,124. Capital, Tirana. Chief cities: Tirana (30,806); Scutari (29,209); Kortcha (22,787); Elbasan (13,796); Valona (9,100). Religion: Mohammedans (688,280); Orthodox Christians (210,313); Roman Catholic (104,184). King: Victor Emmanuel III, king of Italy. Prime minister: Mustafa Merlika Kruja.

History.—Albania shared during 1941 the general fate of the Balkan peninsula. At the beginning of the year the Italian fascist troops under strong Greek pressure were everywhere in retreat and the Greek armies were in occupation of a large part of Albanian territory in the east and in the southeast of the country, where they restored the Albanian law as it had existed before the fascist invasion of the country on Good Friday, 1939, and its union with Italy. In the first months of 1941 the Greeks succeeded in holding all Italian attempts at a reconquest of the lost territory, and even expanded their hold on the country. On Jan. 10 they captured Klisura and pressed toward Tepeleni. In March Premier Mussolini himself visited the Albanian front and assumed personal direction of the operations. Nevertheless the Italian offensives all failed with very heavy losses for the fascist army. Neither, however, were the Greek forces strong enough to capture the long-assaulted Tepeleni on the central front and Valona on the sea. But the Albanian situation changed fundamentally, not through any Italian efforts but through Germany's active participation in the war against Greece. On April 6, 1941, the German forces began active operations against Yugoslavia and Greece. By April 18 the Yugoslav army had surrendered, the Greeks were pushed far back and were unable to hold the Albanian front any longer. Under these conditions the Italians could reoccupy the parts of Albania evacuated by the Greeks, and on April 22 even cross the Greek frontier. The next day the Greek army in the Epirus surrendered to the advancing Germans (*see* WORLD WAR II).

From that moment Albania came again under fascist administration, and fascist laws were reintroduced throughout the country. With the Italian occupation of large parts of Yugoslavia and Greece certain rectifications of the Albanian frontier, by the inclusion of Greek and Yugoslav parts, were envisaged.

Education, Finance, Trade.—Albania had, in 1939, 663 state elementary schools with 38,988 boys and 17,948 girl pupils; in addition, 18 secondary schools for boys and one for girls. The Albanian currency is pegged to the Italian currency. An Albanian franc equals 6.25 lire (32.89 cents U.S., June 1941). In the last year of normal independent Albanian life, in 1938, the imports amounted to 22,397,890 Albanian francs (of which 8,337,109 came from Italy, 1,350,413 from the U.S.A.), the exports to 9,749,959, of which there went to Italy 6,665,257 and to the U.S.A. 435,537. Chief articles of export were hides and furs, wool, cheese and cattle; chief articles of import were cotton and cotton goods, corn and sugar.

Communication and Minerals.—Albania had no railroads in use in 1941, but the Italians have very much improved, for military reasons, the road system, though communications outside the main roads remained primitive in 1941. The main port of the country is Durazzo. With the economic life of the country still on a very primitive level, there exists practically no modern industry. The Italians have made efforts to exploit the mineral resources of the country, especially oil and copper. (*See* also GREECE; ITALY.)

BIBLIOGRAPHY.—Vandeleur Robinson, *Albania's Road to Freedom* (1941). (H. KO.)

Alberta. The most westerly of the prairie provinces of Canada, Alberta was created a province by act of the dominion parliament Sept. 1, 1905. Area, 255,285 sq.mi.; the population by the census of 1941 was 788,393. Seat of government, Edmonton (92,404). The principal cities and their populations (1941 census) are: Calgary (87,264), Lethbridge (14,238) and Medicine Hat (10,473). The province sent 17 members to the house of commons at Ottawa, and six senators to the Canadian senate, as of 1941.

History.—William Aberhart, the premier in 1941, was first elected to office Sept. 3, 1935, at the head of a new party, called the Social Credit party. His government was returned to office at the general elections held in March 1940, securing 36 out of the 57 seats—a loss of 11 seats when compared with 1935. All attempts to put the social credit plan into operation had failed by 1941, and all unorthodox monetary and financial legislation passed by the Alberta legislature had been declared *ultra vires* by the supreme court of Canada, as for example, in Dec. 1941, the Alberta Debt Adjustment act of 1937.

Education.—The province has autonomous control over formal education. In 1939, daily average school attendance was 138,392; teachers numbered 5,963; government grants and tax revenue amounted to $10,196,906.

Communication.—In 1940 there were 3,456 mi. of surfaced roads and 12,309 mi. of improved earth roads. Total expenditure for 1939 was $3,749,141.

Finance.—The province continued to default on its bond maturities during the year. The total in default as of Dec. 1, 1941, was slightly in excess of $22,000,000. Ordinary revenue (1940) was $24,410,040; ordinary expenditure, $21,922,189.

Agriculture.—The following figures as reported by the Dominion bureau of statistics, show the value of the principal field crops for 1941: wheat, $43,200,000; oats, $22,630,000; barley, $9,720,000; rye, $760,000; flaxseed, $1,331,000; potatoes, $1,222,000; hay, clover, $3,775,000; alfalfa, $2,183,000; grain hay, $6,500,000, and sugar beets, $1,782,000. The total value of crops in 1941 was $93,331,000, as compared with $139,659,000 in 1940.

Mineral Production.—The production of crude oil in Canada for 1941 reached an all-time high of some 9,990,000 barrels. Of this volume, 97% was produced from the Turner valley field, which showed an increased output of 15% over 1940. The producing rate for this field, as assigned by the Alberta Petroleum and Natural Gas Conservation board for the conservation and maximum economic recovery of the oil and gas resources, was supplemented by the production stabilization program of the oil controller for an increased volume of output and a uniform rate of production during 1941. Thirty-nine new wells were completed up to Dec. 1, 1941. Exploratory drilling resulted in an extension of 1¼ mi. to the known productive area in the north end of the Turner valley. During the year the production of crude oil was commenced from the bituminous deposits of Athabaska, and some deliveries of refined products were made at McMurray.

(J. T. C.)

Albertini, Luigi (1871–1941), Italian journalist and politician, was born Oct. 19 at Ancona. He was named to the senate in 1914. Albertini was editor and chief owner of *Il Corriere della Sera*, Milan newspaper, from 1909 until 1925, when he was ousted by Mussolini for his outspoken criticism of fascism. A Berne dispatch of Dec. 30 carried the news of his death in Rome. (See *Encyclopædia Britannica.*)

Alexander, Robert (1863–1941), U.S. general, was born Oct. 17 in Baltimore, Md. He quit his law practice in 1886 to join the army and saw service in the Sioux Indian campaigns of 1890–91, the Spanish-American War, the Philippine insurrection and the Mexican campaign. During World War I he rose swiftly from the rank of colonel to major general and was placed in command of the 77th division in Aug. 1918. His troops participated in the Vesle-Aisne advance, the Argonne drive and the big push on Sedan in 1918. Gen. Alexander, who was awarded the D.S.C. and the Croix de Guerre, retired from the army in 1927. He died at the Veterans' Administration hospital in the Bronx, N.Y., Aug. 26.

Alfalfa. Production of alfalfa hay in the United States in 1941 was 32,346,000 tons from 14,929,000 ac., compared with 30,206,000 tons from 13,908,000 ac. in 1940, and a ten-year (1930–39) average, including two extreme drought years, of 24,907,000 tons from 12,867,000 ac. The yield was 2·17 bu. per ac. in 1941 and in 1940, the ten-year average yield being 1·93 bu. per ac. Nearly a quarter of the crop was from three states: Michigan, Wisconsin and Minnesota. Production of alfalfa seed in 1941 was 1,017,100 bu. (61,026,000 lb.), 32% under the output of 1,489,900 bu. (89,394,000 lb.) in 1940. The ten-year average was 1,028,220 bu. (61,693,200 lb.). The 1941 acreage harvested for seed was 791,000 compared with 962,700 ac. in 1940 and a ten-year average of 556,150 ac. The 1941 yield was 1·29 bu. per ac.; 1·55 bu. in 1940 and a ten-year average of 1·87 bu. (*See* also HAY.)

Aliens: *see* CENSUS, 1940: *Race and Nativity;* IMMIGRATION AND EMIGRATION.

Alimentary System, Disorders of. **Disorders of the Oesophagus.**—Camiel and Loewe state that features common to all tumours involving the upper third part of the oesophagus are: location at or near the uppermost portion, paralysis or paresis of one or both vocal cords, inability to swallow, aspiration of food into the tracheobronchial tree, pulmonary complications due to aspiration, and the frequent occurrence of club fingers. With the oesophagoscope Faulkner showed that disturbing thoughts and emotions produce generalized oesophageal spasm, and that certain oesophageal strictures, cardiospasm and pressure diverticula can have their origin in disturbing emotional influences. Garlock believes that the skilled surgeon approaches the serious problem of oesophageal carcinoma with gradually increasing chances of some success from proper operative procedures.

Stomach and Duodenum.—Reports from army and navy hospital centres in Britain and from recruiting centres in Canada lend clinical proof that dyspeptic persons are the largest single group of patients in the armed forces. Difficulties of digestion, from several points of view, constitute the most important medical problems of the war. About one in four dyspeptic persons has a gastric or duodenal ulcer, the latter predominating.

Little advance has been made in the recognition of gastric cancer in its earlier, operable stages. In a consideration of the early roentgenologic diagnosis of this disease Bücker included Konjetzny's description of the macroscopic appearance of the smaller cancers: (1) well defined verrucose, crusted or polypoid mucosal thickening, (2) circumscribed flattened, frequently small, inconspicuous mural thickening with superficial irregular erosions, (3) large superficial erosions with mucosal rims, giving the impression of superficial ulcers, (4) saucerlike shallow ulcers, and (5) typical chronic ulcers. The fact that gastric cancer can masquerade as benign ulcer, not only with the symptoms and signs, but occasionally even reacting in response to treatment, is being amply confirmed by competent observers. The intravenous and intramuscular use of coagulants derived from shepherd's-purse, having as their active principle oxalic acid and related dicarboxylic acids, in the treatment of acute haemorrhage, and diacetyltannin-silver-protein compound in the treatment of inflammatory states of the gastro-intestinal mucous membrane, deserves an extended trial. (*See* also CANCER.)

Biliary Tract and Pancreas.—In the United States the traditional use of the high carbohydrate, low fat and protein diet in the treatment of diseases of the biliary tract is undergoing revision. Experimental and clinical observations confirm the importance of an adequate intake of protein. The protective action of a high protein diet for the liver against the necrotizing action of certain anaesthetic agents and the deleterious influences of other hepatotoxins such as arsphenamine have been demonstrated by Ravdin and others. In the treatment of hepatic cirrhosis Patek and Post advocated a nutritious diet containing a moderate amount of protein (114 gm.) and fat, and dietary supplements rich in the vitamin B complex. Broun and Muether have had encouraging results with a diet low in animal fat and cholesterol, the use of casein and vegetable proteins, and the administration of a 25% watery solution of flavoured choline chloride.

The principal clinical features in a series of 18 cases of pancreatic lithiasis were, according to Snell, colic, motor disturbances of the stomach and small intestine, diabetes, actual and latent, loss of weight and fatty diarrhoea. The diagnosis depends chiefly on the roentgenologic evidence of stones.

Intestines.—Sulphonamides loom increasingly important in the medical and surgical treatment of intestinal disturbances. Bacillary dysentery and other infections caused by the so-called colon-typhoid-dysentery group of organisms are reported to respond favourably to this form of chemotherapy. Sulphanilylguanadine is particularly recommended because of its low toxicity. Whether it possesses any real advantage over the other sulphonamides remains to be seen. Fatalities arising from acute appendicitis and its complications seem likely to be reduced by the augmentation of chemotherapy with intelligently used gastrointestinal decompression. The curative effect of sulphanilamide and sulphapyridine in the treatment of abdominal as well as other forms of actinomycosis appears to be confirmed by the observations of Dorling and Eckhoff.

Dis.* (July 1941).

(G. B. EN.)

Allergy. The question whether sensitivity in humans (allergy) is comparable to similar conditions in animals (anaphylaxis) is of more than academic interest, because of the application of observations in animal experiments to allergy in humans. The relationship of the two conditions was demonstrated by the study of typical spontaneous hay fever in a dog (Wittich). The animal gave positive skin, eye and nasal reactions to the suspected pollens. The similarity of anaphylaxis (induced sensitization in animals) and allergy was confirmed by Cohen and Weller, who succeeded in demonstrating the presence of antibodies known as precipitins in the blood of typically allergic patients. Such antibodies heretofore had been found only in the blood of sensitized animals, particularly in rabbits.

Another interesting contribution in the field of experimental sensitization was reported by Loveless. Three non-allergic patients who were suffering from incurable conditions permitted themselves to be transfused with the blood of pollen-sensitive cases. All three developed symptoms of pollen sensitivity lasting up to 24 days.

A number of new causes for allergic symptoms were reported during 1941. A patient with hives of 15 months' duration was found sensitive to acrolein and other common, related aldehydes (Rappaport and Hoffman). Since acrolein is common as a combustion product of fats, as in the frying of foods, and since many aldehydes (in perfumes and aromatic foods) are related to acrolein, it may indicate a new and important cause of allergic symptoms. Ascher reported nasal allergy caused by the use of psyllium seeds as a laxative. To the many known causes of asthma were added paprika (Gelfand), and gum acacia (Bohner, *et al.*). While acacia was previously reported as a rare cause of allergy, the authors found ten patients with asthma due to its use as an offset spray in printing. Insect emanations, as a cause of asthma, were given added importance by the reports of asthma due to moths (Urbach), to beetles (Sheldon and Johnston), and to a crustacean known as the water flea (Way).

Most important contributions were toward improvement in the treatment of pollen sensitivity. Most of the work was limited to changes in pollen solutions involving the preparation of a material which would be absorbed more slowly, and would permit fewer injections for immunization. Spain and his co-workers reduced the rate of absorption of pollen by adding gelatin to the solution, with excellent results in the treatment of a group of patients. Strauss and Spain reported the chemical union of ragweed pollen with sulphanilic acid. This conjugated product retained its potency as demonstrated by skin tests. Naterman reported excellent results in 90% of hay fever cases treated with a tannic acid precipitate of pollen.

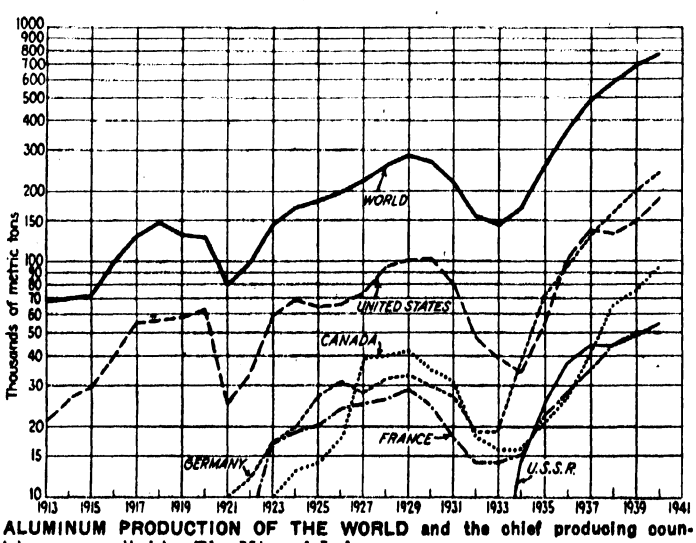
Alphonso XIII (1886–1941), king of Spain, was born May 17 in Madrid. Two weeks before his death the former monarch issued a manifesto, renouncing his rights to the throne in favour of his son, Don Juan, whom a monarchist faction hailed as the future Juan III. In 1939 the Franco government decreed the restoration to Alphonso of property valued at about $8,500,000, which had been confiscated by the Spanish republic in 1932, the year after he fled the throne. He died in Rome, Feb. 28. The Franco government granted permission for his burial in the royal pantheon of the Escorial near Madrid. For his earlier career see *Encyclopædia Britannica.*

Aluminum. The estimated world production of aluminum (also spelled aluminium) increased from 670,000 metric tons in 1939 to 785,000 tons in 1940, of which 240,000 tons are attributed to Germany, 188,000 tons to the United States, 95,000 to Canada, 55,000 to the Soviet Union, 50,000 to France, 36,000 to Italy, 32,000 to Japan, 29,000 to Switzerland, 20,000 to Norway, and smaller amounts to minor producers. No estimates were received for 1941, but the growing demand for military uses assures an even greater increase in 1941 than that of 1940.

The United States output increased 29% in 1940, to 206,280 short tons and would show a further heavy increase in 1941. No specific figures had been made public, but an expansion program that called for an output of about 340,000 tons by midyear was known to have been approximately achieved, and good progress was reported on further additions that would add a similar tonnage early in 1942, and still further additions would probably be made. Secondary recovery increased to 68,045 tons in 1940, and was expected to keep pace with new output in 1941. Demand from abroad kept exports well ahead of imports during 1939 and 1940, but in 1941 exports were limited and this, in connection with lack of accessibility to foreign sources of supply, cut both imports and exports to below normal.

Following a reduction in price from 20 cents per lb. to 17 cents during 1940, the price was further reduced to 15 cents on Oct. 1, 1941.

Production conditions outside of the United States were kept so well under cover that only inferences can be drawn. The distance between Great Britain and sources of bauxite supply made it likely that there would be little increase in British production, as it was more feasible to take British Guiana bauxite to Canada, and such increases as might be made were more likely to come in Canada than in Britain. Two-thirds of the Russian capacity was on the Dnieper river, and had presumably been destroyed. Germany had direct access to bauxite supplies in Hungary, Yugo-



ALUMINUM PRODUCTION OF THE WORLD and the chief producing countries, as compiled by *The Mineral Industry*

DISPLAYS OF USED ALUMINUM contributed by housewives and others to purposes of national defense appeared throughout the U.S.A. in the spring and summer of 1941

slavia and Greece, from Italy if needed, and probably from France as well; this assured a plentiful supply, and if German output were restricted in any way, it would not be likely to be from lack of ore supplies. Italian production probably was enlarged, and also that of Japan. While the Norwegian smelters were entirely under German control, it was expected to be extremely difficult to keep them supplied with ore, and it was doubtful if they could be kept going. While Switzerland was still nominally independent of German control, the smelters were dependent on ore supplies that were under complete German control, so that it was likely that Swiss production was in 1941 largely for German benefit. The growing subservience of Vichy France to German domination probably put both the French ore supplies and smelters under German control insofar as they might have been needed, even though they were located in the unoccupied area. (*See* also CYROLITE.) (G. A. Ro.)

Ambassadors and Envoys.

The following is a list of ambassadors and envoys to and from the United States and to and from Great Britain Jan. 1, 1942.

To and From the United States

(*=ambassadors; unstarred, envoys.)

To the United States	*Country*	*From the United States*
*Espil, Felipe A.	Argentina	*Armour, Norman
Casey, Richard G.	Australia	Johnson, Nelson T.
*Straten-Ponthoz, Count Robert van der	Belgium	*Biddle, Anthony J. D., Jr.[3]
Guachalla, Dr. Luis F.	Bolivia	Jenkins, Douglas
*Martins, Carlos	Brazil	*Caffery, Jefferson
McCarthy, Leighton	Canada	Moffat, Jay Pierrepont
*Michels, Rodolfo	Chile	*Bowers, Claude G.
*Hu Shih, Dr.	China	*Gauss, Clarence E.
*Turbay, Dr. Gabriel	Colombia	*Braden, Spruille (absent)
Fernández, Dr. Luis	Costa Rica	Lane, Arthur Bliss
*Concheso, Dr. Aurelio F.	Cuba	*Braden, Spruille (appointed)
Hurban, Vladimír	Czechoslovakia	Biddle, Anthony J. D., Jr.[3]
Kauffmann, Henrik de	Denmark	Atherton, Ray (absent)
Troncoso, Dr. J. M.	Dominican Rep.	Scotten, Robert M.
*Alfaro, Capt. Colón E.[1]	Ecuador	Long, Boaz
Hassan Bey, Mahmoud	Egypt	Kirk, Alexander C.[4]
Brennan, Robert	Eire (Ireland)	Gray, David
Castro, Dr. Hector D. (absent)	El Salvador	Frazer, Robert (absent)
Kaiv, Johannes[2]	Estonia	. . . . .
Procopé, Hjalmar J.	Finland	Schoenfeld, H. F. Arthur
*Henry-Haye, Gaston	France	*Leahy, William D.
*Halifax, Viscount	Great Britain	*Winant, John G.
Diamantopoulos, Cimon P.	Greece	Biddle, Anthony J. D., Jr.[3]
Recinos, Dr. Adrian	Guatemala	Des Portes, Fay A.
Dennis, Fernand	Haiti	White, John C.
Caceres, Dr. Julian R.	Honduras	Erwin, John D.
Thors, Thor	Iceland	MacVeagh, Lincoln
Schayesteh, Mohammed	Iran	Dreyfus, L. G., Jr.[5]
Bilmanis, Dr. Alfred	Latvia	. . . . .
Žadeikis, Povilas	Lithuania	. . . . .
Le Gallais, Hugues	Luxembourg	Moffat, Jay Pierrepont[6]
*Castillo Nájera, Dr. Francisco	Mexico	*Messersmith, George S. (appointed)
Loudon, Dr. A.	Netherlands	Biddle, Anthony J. D., Jr.[3]
DeBayle, Dr. León	Nicaragua	Boal, Pierre de L.
Munthe de Morgenstierne, Wilhelm	Norway	Biddle, Anthony J. D., Jr.[3]
*Jaén Guardia, Ernesto.	Panama	*Wilson, Edwin C.
Soler, Dr. Juan José	Paraguay	Frost, Wesley
*Freyre y Santander, Manuel de	Peru	*Norweb, R. Henry
*Ciechanowski, Jan	Poland	*Biddle, Anthony J. D., Jr.[3]
Bianchi, João A. de	Portugal	Fish, Bert
*Cárdenas, Juan F. de	Spain	*Weddell, Alexander W.
Boström, W.	Sweden	Sterling, Frederick A.
Bruggmann, Charles	Switzerland	Harrison, Leland (absent)
Seni Pramoj, Rajawongse	Thailand	. . . . .
*Ertegün, Mehmet M.	Turkey	*Steinhardt, Laurence A. (appointed Jan. 1942)
Close, Ralph W.	Union of South Africa	Keena, Leo J.
*Litvinov, Maxim	U.S.S.R.	*Steinhardt, Laurence A. (absent)
*Blanco, Dr. Juan C.	Uruguay	*Dawson, William
*Escalante, Dr. Diógenes	Venezuela	*Corrigan, Frank P.
Fotić, Constantin	Yugoslavia	Biddle, Anthony J. D., Jr.[3]

[1]Rank of ambassador for duration of boundary negotiations between Ecuador and Peru. [2]Acting consul general, in New York city. [3]Accredited to governments of Belgium, Czechoslovakia, Greece, The Netherlands, Norway, Poland and Yugoslavia, all established in England. [4]Accredited also to Saudi Arabia; resident in Cairo. [5]Accredited also to Afghanistan; resident in Tehran. [6]Minister to Canada but accredited also to government of Luxembourg, established in Canada.

To and From Great Britain

(*=Ambassador; unstarred=Envoy-Extraordinary; ‡=Minister Resident; §=Chargé d'Affaires.)

To Great Britain	*Country*	*From Great Britain*
Sardar Ahmed Ali Khan	Afghanistan	Wylie, Sir F. V.
Carcano, Dr. Miguel Angel	Argentina	*Ovey, Sir Esmond
*de Marchienne, Baron E. de C.	Belgian Govt.	*Oliphant, Sir Lancelot (returned to London Sept. 30, 1941)
Patiño, Antenor	Bolivia	Dodds, J. L.
*de Aragão, J. J. Moniz	Brazil	*Charles, Sir Noel N. H.
*Bianchi, Manuel	Chile	*Orde, Sir Charles W.

[3]Minister and consul-general.

American Academy of Arts and Letters.

This organization was founded in 1904 by the National Institute of Arts and Letters. It is an honorary educational body limited to 50 members, who are elected from the membership of its parent body, the National Institute of Arts and Letters, also an honorary educational body limited to 250 members qualified by notable achievement in art, music or literature.

Throughout 1941 a joint exhibition of the works of Childe Hassam and of Edwin Austin Abbey, both deceased members of the academy, was shown in the art gallery and was to continue indefinitely. The Abbey paintings were lent by Yale university. The art gallery and the permanent museum are open and free to the public from 1 to 5 P.M. weekdays (closed Mondays) and from 2 to 5 P.M. Sundays and holidays.

The officers of the academy for 1941 were: Walter Damrosch, president; James Truslow Adams, chancellor and treasurer; William Lyon Phelps, secretary. The other six directors were Stephen Vincent Benét, Van Wyck Brooks, William Adams Delano, Charles Dana Gibson, Deems Taylor and Chauncey B. Tinker. (F. GN.)

American Academy of Arts and Sciences.

The academy is limited to 800 fellows and 130 foreign honorary members, divided among four classes: mathematical and physical sciences, natural and physiological sciences, the social arts, the humanities. The officers for the year 1941 were: president, Harlow Shapley; corresponding secretary, Abbott P. Usher; recording secretary, Hudson Hoagland; treasurer, Horace S. Ford. The following papers were presented at regular monthly meetings: Tenny L. Davis, "The Identity of Chinese and European Alchemical Theory"; Edward L. Thorndike, "The Development, Retention and Attraction of Superior Men"; Fletcher G. Watson, "The Approaching Comet"; James G. Baker, "Trends in Astronomical Optics"; Donald H. Menzel, "Motions in the Solar Atmosphere"; Thomas Head Thomas, "The Hitler War and Hemisphere Defense"; Harold E. Edgerton, "Stroboscopic Light and its Applications"; Herbert Brown Ames, "Canada's Major Contribution in the Present War"; Kenneth J. Conant, "The Architectural Revolution: an Historical Background for the New Architecture in America."

May 14, 1941 awards were made from the Francis Amory fund for distinguished contributions to the treatment and cure of disease and derangement of the human genitourinary organs. Awards were made to Dr. Joseph F. McCarthy, to Dr. Carl Richard Moore, to Dr. Hugh H. Young, and to a scientist in nazi-occupied Europe whose name was withheld. The recipients of prizes gave brief descriptions of their work.

The following papers were read by title: Tenny L. Davis and Chao Yün-ts-'ung, "Four Hundred Word Chin Tan of Chang Po-Tuan"; J. H. Bartlett and R. E. Watson, "The Elastic Scattering of Fast Electrons by Heavy Elements"; Charles T. Brues, "Photographic Evidence on the Visibility of Color Patterns in Butterflies to the Human and Insect Eye."

Grants in aid of research were made from the Rumford fund, the C. M. Warren fund and from the Permanent Science fund. (A. P. U.)

American Academy of Political and Social Science.

On April 4 and 5, 1941 there was held the 45th annual meeting, with the general subject "Defending America's Future," the proceedings of which, together with a number of additional articles, appeared in the

July issue of *The Annals*. Other meetings included a session on "Canada and the United States" held on Feb. 4, at which the Hon. Athanase David of Ottawa, Canada and John MacCormac of Washington, D.C. were the speakers, with Dr. F. Cyril James of McGill university presiding; a meeting on March 4, addressed by Gerhard Colm of the treasury department, Prof. O. M. W. Sprague of Harvard university, and the Hon. Arthur A. Ballantine of New York, formerly undersecretary of the treasury, with Alexander Biddle of Philadelphia presiding, on "How to Finance National Defense"; and, on Nov. 14, a session on "When the War Ends," addressed by Señor Julio Alvarez del Vayo of Spain, Count Carlo Sforza of Italy and Sir Norman Angell of Great Britain.

The volumes of *The Annals*, the academy's bimonthly journal, are unique in that each is a symposium of some special subject of current interest. During 1941 the six issues, including the July volume, had the following titles: "New Horizons in Radio" (January); "Billions for Defense" (March); "America and Japan" (May); "Defending America's Future" (July); "Crime in the United States" (September); "Public Policy in a World at War" (November).

Student memberships, announced during 1940, totalled by the end of 1941 approximately 275. Under this arrangement students enrolled in educational institutions receive all of the privileges of regular membership, but at a cost of only $3 per year instead of the usual $5.

The officers for the year were: Ernest Minor Patterson, president; J. P. Lichtenberger, secretary; Charles J. Rhoads, treasurer; Thomas S. Hopkins, assistant treasurer; Herbert Hoover, Carl Kelsey and C. A. Dykstra, vice-presidents. Headquarters are at 3457 Walnut st., Philadelphia, Pa. (E. M. P.)

American Association for the Advancement of Science.

The officers of the American Association for the Advancement of Science for 1941 were Irving Langmuir, associate director of the research laboratory of General Electric company, president; Forest Ray Moulton, permanent secretary; Otis W. Caldwell, general secretary; Charles Carroll Morgan, treasurer; and Sam Woodley, assistant secretary. The retiring president, Dr. Walter B. Cannon, delivered an address on "The Body Physiologic and the Body Politic."

In 1941 the membership of the association passed 21,500. Its affiliated and associated societies, 181 in number, had a combined membership, including duplications, of nearly 1,000,000. The association held three meetings in 1941, its annual meeting in Philadelphia, Pa., which closed on Jan. 2, a joint meeting at Durham, N.H., June 23–28, and a meeting at Chicago, Ill., Sept. 22–27. The attendance at the annual meeting was about 6,000, including representatives from 46 states, four dependencies and nine foreign countries. At this meeting a total of 2,164 addresses and papers were delivered or read. The annual association $1,000 prize was awarded to Drs. D. R. Hoagland and D. I. Arnon for their investigations on plant nutrition. Eighteen grants in aid of research were given. One of the features of the meeting was a symposium on "Human Malaria," including 43 contributions by leading authorities, which has been published by the association as a 406-page volume. This is the 15th volume in its symposium series. *Strange Malady—The Story of Allergy*, by Dr. Warren T. Vaughan, was published during the year as one of the association's non-technical series. The June meeting was held in connection with the celebration of the 75th anniversary of the founding of the University of New Hampshire, and the September meeting in connection with the celebration of the 50th anniversary of the founding of the University of Chicago. (F. R. Mo.)

American Bankers Association.

The association was active in the banking field during 1940–41 under the administration of P. D. Houston, chairman of the board of the American National bank, Nashville, Tenn.

Four new divisions of the association, a consumer credit department, a department of research in real estate and mortgage loans, a department of customer relations and a department of economics, all of which were established tentatively during 1939–40, proved effective in their operations and were made a permanent part of the association's activities.

Both the new departments and the previously established divisions, sections and commissions of the A.B.A. devoted a substantial part of their efforts to problems dealing with national defense financing, working in co-operation with congress and various government departments and agencies.

Officers elected at the 67th annual convention of the association in Chicago, Sept. 28–Oct. 2, 1941, for the ensuing year were: president, Henry W. Koeneke, Ponca City, Okla.; first vice-president, W. Linn Hemingway, St. Louis, Mo.; second vice-president, A. L. M. Wiggins, Hartsville, S.C.; treasurer, William F. Augustine, Boston, Mass.; executive manager, Dr. Harold Stonier, New York, N.Y.; secretary, Richard W. Hill, New York, N.Y.; senior deputy manager, Frank W. Simmonds, New York, N.Y.; national bank division, president, W. C. Bowman, Montgomery, Ala.; vice-president, S. A. Phillips, Louisville, Ky.; savings division, president, Stuart C. Frazier, Seattle, Wash.; vice-president, W. W. Slocum, Detroit, Mich.; state bank division, president, James H. Penick, Little Rock, Ark.; vice-president, Frank P. Powers, Mora, Minn.; trust division, president, Richard G. Stockton, Winston-Salem, N.C.; vice-president, Louis S. Headley, St. Paul, Minn.; state secretaries section, president, William Duncan Jr., Minneapolis, Minn.; first vice-president, Fred Bowman, Topeka, Kan. (L. Gn.)

American Bar Association.

At the 1941 meeting in Indianapolis leading English, Canadian and Latin-American jurists discussed hemispheric solidarity and world order. During the year the committee on national defense, headed by Edmund R. Beckwith, organized state and local bar committees to co-operate in the administration of the Selective Service act, give free legal aid to men in service and their families, and furnish leadership in the maintenance of civilian morale. Under the chairmanship of Judge John J. Parker, the committee on improving the administration of justice promoted its nation-wide program to integrate the judiciary, improve the jury system, simplify trial and appellate practice and the rules of evidence, and improve the procedure of administrative tribunals.

Awards: annual medal of the association to George Wharton Pepper, former U.S. senator, for conspicuous service in the cause of United States jurisprudence; Ross prize of $3,000 to Willard Bruce Cowles of Washington, D.C., for an essay on "The Prospective Development of International Law in the Western Hemisphere as Affected by the Monroe Doctrine"; awards of merit to the Colorado Bar association and the Bar Association of St. Louis, Mo.

Elected at the 1941 meeting were: Walter P. Armstrong, president; Guy R. Crump, chairman of the house of delegates; Harry S. Knight, secretary; John H. Voorhees, treasurer; Joseph D. Stecher, assistant secretary. (M. Dn.)

American Bible Society.

The 125th annual meeting of the American Bible society was held in May 1941. John T. Manson is president. Gilbert

Darlington is treasurer. General secretaries are Rev. Dr. Eric M. North, in charge of translation and foreign activities, and Rev. Dr. Frederick W. Cropp, in charge of activities in the United States. Rev. Dr. Francis C. Stifler is editorial and recording secretary.

The society distributes about 3,700,000 volumes of Scripture annually in the United States. In co-operation with the British and Foreign Bible society, the Scottish Bible society and other missionary organizations, the Scriptures were translated into 1,051 languages up to the end of 1940, and more than 25,000,000 volumes of Scripture were distributed in 1940 throughout the world. The society's principal office is at Park avenue and 57th street, New York city, with branch offices in 11 cities in the United States and agencies, depositories and publishing offices in many other countries, in co-operation with the British and the Scottish Bible societies. The American Bible society elects a vice-president from each of the 48 states and among those so chosen have been Chief Justice Hughes, John R. Mott, William Lyon Phelps, J. L. Kraft and General Evangeline Booth. (F. C. St.)

American Chemical Society.

The society operates under a national charter from the 75th congress. In 1941 the presidency passed from Dr. S. C. Lind of the University of Minnesota to Dr. William Lloyd Evans of Ohio State university with Dr. Harry N. Holmes of Oberlin college as president-elect. Holmes became president Jan. 1, 1942. National meetings in St. Louis and Atlantic City showed attendances of 3,960 and 5,021 with 462 and 550 papers, respectively. The 96 local sections were more active than ever. The awards of the society: Karl A. Folkers, American Chemical society award in pure chemistry; David Rittenberg, Eli Lilly and company award; Claude S. Hudson, Borden award; Thomas Midgley, Jr., Priestley medal; Alexander Silverman, Pittsburgh award; Ferdinand G. Brickwedde, Hillebrand award; Linus Pauling, Nichols medal; Arthur W. Burwell, Schoellkopf medal; Edward A. Doisy, Willard Gibbs medal. Membership passed 28,000. (C. L. Ps.)

American Citizens Abroad.

The following is an estimate of the number of American citizens living abroad, as of Jan. 1, 1941, compiled from reports received from U.S. consulates in all parts of the world. This estimate includes only those whose residence abroad has a permanent or semipermanent character and therefore excludes tourists and all others whose sojourn abroad was considered to be only transitory.

Attention is called to the fact that because of the disturbed conditions existing in certain areas of the world, it has been impossible in many cases for consular officers to obtain exact figures as to the number of U.S. citizens residing in their respective districts. However, this statement, based on all available sources of information, may be considered as a reasonably accurate estimate of Americans living abroad as of Jan. 1, 1941.

Travel Outside the Western Hemisphere.—Because of the war, U.S. passports were not valid in 1941 for use in countries or territories outside the western hemisphere, unless the name of the country to be visited and the object of the visit were specifically stated on the passport by the department of state or under the department's authority. Persons desiring permission to travel outside the hemisphere were required to submit documentary evidence of the necessity for such trips. Citizens of the U.S. visiting countries within the hemisphere but travelling on belligerent vessels in the Atlantic ocean north of 35° N. lat. and east of 66° W. long. were required to obtain special permission from the department of state. Failure to do so might subject the traveller to prosecution under the terms of the neutrality act of 1939.

American College of Surgeons.

The college was founded in 1913 by 500 surgeons of the United States and Canada, under the leadership of the late Dr. Franklin H. Martin, to ensure a standard of professional, ethical and moral requirements for every graduate in medicine who practises general surgery or any of its specialties. Fellowship, 1942: 13,300. Chairman, board of regents, Dr. Irvin Abell, Louisville, Ky.; president, 1941–42; Dr. W. Edward Gallie, Toronto, Ont.; president-elect, Dr. Irvin Abell, Louisville, Ky.; treasurer, Dr. Dallas B. Phemister, Chicago, Ill.; secretary, Dr. Frederic A. Besley, Waukegan, Ill.; associate director and chairman, administrative board, Dr. Malcolm T. MacEachern, Chicago, Ill.; associate director, Dr. Bowman C. Crowell, Chicago, Ill.; assistant directors, Dr. E. W. Williamson and Dr. Harold Earnheart, Chicago, Ill. The organization originated hospital standardization, 1918, formulating minimum standards for approval and starting periodic surveys; 2,873 hospitals in United States, Canada and other countries were on the 1941 approved list; 376 cancer clinics in hospitals and 959 medical services in industry were approved in 1941. An approved list of medical motion picture films is also issued yearly. The college maintains a medical library and literary research department. The committee on graduate training for surgery was organized in 1937. Committees on cancer, archives of cancer, fractures and other traumas, and the Hall of the Art and Science of Surgery function through a department of clinical research. Sectional meetings were held in 1941 in Minneapolis, Minn.; Pittsburgh, Pa.; and Salt Lake City, Utah. The 31st Annual Clinical congress and the 24th Annual Hospital Standardization conference, attended by 3,000 surgeons and 1,500 hospital executives, were conducted by the college in Nov. 1941, in Boston, Mass. (M. T. M.)

American Economic Association.

The purpose of the American Economic association (founded in 1885) is to encourage economic research, issue publications on economic subjects, and stimulate thought and discussion of current problems from an economic point of view. The publications of the association consist of a quarterly, the *American Economic Review*, the *Proceedings* of the annual meetings, occasional monographs on special topics and a biennial handbook or directory of its membership and an information booklet. The program of the 54th annual meeting, held in New York city, in Dec. 1941, was devoted to current economic problems of vital importance affecting war and postwar adjustments.

Officers for the year 1942 were: president, Edwin G. Nourse, Brookings institution; vice-presidents, Frederic B. Garver, University of Minnesota; Frank D. Graham, Princeton university; secretary-treasurer, James Washington Bell, Northwestern university; elected members of the executive committee, J. Douglas Brown, Princeton university; George W. Stocking, University of Texas; Stacy May, Rockefeller foundation; Edwin E. Witte, University of Wisconsin; William L. Crum, Harvard university; Leonard L. Watkins, University of Michigan. The 1942 edition of the handbook, in the form of a specialized "who's who," contained a list of approximately 3,500 members and 1,300 libraries and other subscribers. (J. W. Bl.)

American Federation of Labor.

During 1941, as previously, the American Federation of Labor was mainly concerned with raising the level of life and work for the wage earners. The membership of the American Federation of Labor reached an all-time peak of 4,569,056 members in good standing as of Aug. 31, 1941—the time of the annual report.

The federation pledged its full and unqualified support of the government in its war program and subscribed to a no-strike policy on all defense projects. All unions were urged to forgo strikes during the period of the emergency. This means that the members of the American Federation of Labor voluntarily relinquished their right to strike on defense production for the duration of the war. At the same time the federation insisted that the workers be free from legislative restrictions on their economic rights, in the firm belief that the greatest benefit to all would accrue from voluntary action.

The federation continued its efforts to raise the living standards of the wage earners through increasing the share received by workers in accord with their increased productivity and resultant higher income from the industry to which they were attached. In its annual report the executive council of the federation called attention to the fact that American industry had been able to increase wages substantially and at the same time maintain profits.

The federation kept watch over pending legislative proposals to make sure that provisions were incorporated for the enforcement of labour laws and other government activities of particular interest to labour.

All efforts were made to prevent any impairment of the social gains made by labour in the past, such as fair labour standards and social security.

The executive council of the American Federation of Labor and international executives of affiliated organizations pledged wholehearted support to the government for the duration of the war in support of democratic principles. The federation and its affiliates invested millions of dollars in defense bonds and were expected to continue investments regularly.

The American Federation of Labor also urged advance planning

for postwar adjustments. (*See* also CONGRESS OF INDUSTRIAL ORGANIZATIONS; LABOUR UNIONS; STRIKES AND LOCK-OUTS; UNITED STATES: *History.*) (W. G.)

American Geographical Society. During the summer of 1941 the Fourth Wood Yukon expedition under the sponsorship of the American Geographical society was carried out under the leadership of Walter A. Wood, head of the society's department of exploration and field research, completing a program of aerial mapping begun in 1935 and continued on subsequent expeditions in 1937 and 1939. Mt. Wood (15,800 ft.) and Mt. Walsh (14,800 ft.) were both climbed in successful tests of the feasibility of supplying expeditions in mountainous terrain by parachute. A second expedition sponsored by the society and led by William O. Field, Jr., of the society's staff spent several weeks studying glacier changes in southeastern Alaska in continuation of the leader's earlier studies in the region. The topographical map of the Sierra Nevada de Santa Marta, Colombia, South America, constructed from aerial photographs taken in 1939 under the society's sponsorship by the Cabot Colombian expedition was completed and published. Only one gold medal award was made —the Charles P. Daly medal to Julio Garzón Nieto, chief of the office of longitudes and boundaries of the Colombian government.

The society's publications during the year included an addition to the Special Publications series entitled "Focus on Africa" (a volume of aerial photographs taken on a journey in their own plane from Capetown to Cairo, with accompanying narrative and geographical description, by Richard U. Light and Mary Light) and a brochure entitled "European Possessions in the Caribbean Area." Compilation and drafting was also completed on a 3-sheet map of Latin America on the scale of 1 : 5,000,000 based chiefly on the sheets of the society's map of Hispanic America on the scale of 1 : 1,000,000.

The publication of the society's quarterly journal, *The Geographical Review,* was continued during the year, and to its other periodical publication, *Current Geographical Publications* —a classified list of titles of books, articles and maps selected for inclusion in the Society's Research catalogue, which is issued in mimeographed form monthly except for July and August—a new section, consisting of an annotated list of published photographs of geographical interest, was added. (*See* also EXPLORATION AND DISCOVERY.) (R. R. P.)

American Historical Association was incorporated by act of congress in 1889 "for the promotion of historical studies . . . and for kindred purposes in the interests of American history and of history in America." It had (Oct. 1, 1941) a membership of about 3,600, chiefly recruited from the teachers and writers of history in U.S. and Canadian schools and colleges. Its national headquarters were in 1941 at study room 274, library of congress annex, Washington, D.C. It was governed by a council elected at the annual meeting and supported by annual dues ($5) and by the income of an endowment fund of about $250,000. Its officers for the year 1941 were: president, Arthur M. Schlesinger, Harvard university; first vice-president, Nellie Neilson, Mt. Holyoke college; second vice-president, William L. Westermann, Columbia university; treasurer, Solon J. Buck, the National Archives; executive secretary and editor, Guy Stanton Ford, Washington, D.C.; assistant secretary-treasurer, Patty W. Washington.

During 1941 it continued the publication of *The American Historical Review,* the leading historical journal in the U.S., and participated in the publication of *Social Education,* devoted to the problem of teaching the social studies in the school. (G. S. F.)

American Indians: *see* INDIANS, AMERICAN.

American Institute of Architects. Founded in 1857, the American Institute of Architects is the national organization of the architectural profession in the United States. It is composed of upwards of 3,100 individual members, each of whom is a qualified architect. The members are grouped in 71 local chapters and 21 state associations. Through these organizations more than 8,000 architects of the United States are under its aegis. The objects of the organization are: to organize and unite in fellowship the architects of the United States; to combine their efforts so as to promote the aesthetic, scientific and practical efficiency of the profession; to advance education in architecture and in the arts and sciences allied therewith, and to make the profession of ever-increasing service to society. Its principal activities are directed toward the achievement of the above stated objects of the organization. The officers of the institute were in 1941: president, R. H. Shreve, New York; vice-president, Walter R. MacCornack, Boston, Mass.; secretary, Charles T. Ingham, Pittsburgh, Pa.; treasurer, John R. Fugard, Chicago, Ill. Its headquarters were at 1741 New York avenue, N.W., Washington, D.C. (R. H. SE.)

American Iron and Steel Institute. A substantial part of the activities of the American Iron and Steel institute during 1941 related to the steel industry's function in the national defense program. In connection with that program, the institute cooperated with the Office of Production Management, with the war and navy departments and with other government agencies concerned with defense. Important in the institute's defense activities was the compilation of statistical information relative to production, capacity, shipments, etc., from individual companies in the industry and the transmittal of such information to the defense agencies. In addition, numerous committees of metallurgists and other technical people within the industry served on institute committees, dealing with such problems as government specifications for iron and steel products, standardization and similar related technical subjects. Although activities in connection with the defense program were of major importance during 1941, the regular activities of the institute were continued. Among these were the publication and distribution of booklets and the compilation and publication of a series of freight tariffs on iron and steel products, from important origin points to principal destinations. Another important activity was the providing of accurate information concerning the industry to editors, writers and the public generally. Thousands of requests for such information were handled during the year. (W. S. To.)

American Judicature Society. The American Judicature society was incorporated in 1913 under the laws of Illinois to promote the efficient administration of justice. It first issued a series of bulletins surveying the fundamentals of judicial administration, and in 1917 began publication of the bi-monthly *Journal,* in its 25th volume (1941). The society's interest embraces the whole field of judicial administration, civil and criminal, state and federal, and it aids in improvement of bar and court organization, judicial selection and tenure, civil and criminal procedure, and legal education and admission to the bar. It has laid the foundation for virtually every reform accomplished and under way in its field. During its first 12 years it was supported entirely by Charles F. Ruggles, a layman. In 1941 it had 2,600

members, mostly lawyers, law teachers and judges. Membership is open to all, with dues at $5 a year. Subscriptions to the *Journal* are free. The society co-operates closely with the American Bar association and with state and local bar organizations, all of which its *Journal* serves in the field of judicial administration. Officers in 1941 were David A. Simmons, president; John J. Parker, Merrill E. Otis, Homer Cummings, Edward R. Finch and John G. Buchanan, vice-presidents; Thomas F. McDonald, chairman of the board; Herbert Harley, secretary-treasurer; and Glenn R. Winters, assistant secretary-treasurer. Offices are in Hutchins hall, University of Michigan, Ann Arbor, Mich. (H. HAR.)

American Law Institute. Since its organization, the chief work of the American Law institute has been a *Restatement of the Law,* best described as an orderly statement of the present common law. While the sections into which the restatement is divided are written in statutory form, they are not presented to legislatures for adoption. The object of the restatement is to clarify and simplify the common law, but not to prevent its continued development by judicial decision. Prior to 1941, 15 volumes of the restatement were published, including the law of contracts, conflict of laws, agency, trusts, restitution and security, besides large portions of the law of property and torts. During 1941 work on the restatement of the subjects, judgments, security and the fourth volume of the restatement of the law of property went forward. Work on the volume on the restatement of security was concluded and published. The institute was also engaged on two other projects of importance—the drafting of a model code of evidence and statutes dealing with the administration of the criminal law in so far as it affects youths between 16 and 21 convicted of crime. A model statute creating a treatment board to which such convicted youths will be sentenced was adopted at the annual meeting in May 1940 and steps were taken in 1940 and 1941 to secure its consideration by state legislatures. In July 1941 the act was adopted in California. An act creating a model youth court was adopted at the annual meeting in May.

The American Law institute was organized in Feb. 1923. Its object is to carry on constructive scientific work for the improvement of the law. Aside from the official members, who are those holding the leading judicial, bar and law school faculty positions, there are 725 life members; membership being a distinct professional honour. The governing body is a council of 33. The members meet each year in Washington, D.C. All legal and other official publications of the institute must be first approved by the council and by a meeting of members. The president in 1941 was George Wharton Pepper; William Draper Lewis was director and chief of the editorial staff. The executive office is at 3400 Chestnut street, Philadelphia, Pennsylvania. (W. D. L.)

American Legion. In 1941 the American Legion practically went on a complete war basis to throw the full weight of its manpower, prestige and influence into America's all-out national defense effort. All its other activities were co-ordinated with this main program.

During 1941 the Legion registered 900,000 of its members for national defense service; sent a mission at its own expense to Great Britain to study civilian defense functions in modern warfare; published the first handbook in the United States on civilian participation in air-raid warning and air-raid precautionary services; enrolled and trained tens of thousands of observers for air-raid warning posts; organized thousands of air-raid observation posts; established a division of defense at national headquarters; participated in numerous air-raid warning tests

LYNN U. STAMBAUGH waving to delegates of the American Legion convention at Milwaukee after his election as national commander Sept. 18, 1941. Beside him is Milo J. Warner, retiring commander

conducted by the army and received high commendation; sponsored test blackouts in many cities; conducted a recruiting campaign for the navy; pledged itself to promote service as flying cadets for the army and navy; suggested and participated in the aluminum collection campaign; invested post, department and national funds in defense bonds and supported bond-buying campaigns; established blood banks; organized "ham" radio networks for emergency service; entered into a nation-wide physical education campaign; worked with the FBI against spies and saboteurs; extended its free rehabilitation services to all members of the present armed forces; aided in finding employment for discharged conscripts.

There was further expansion of the Legion's youth-training activities, with many thousands of pupils in 46 states participating in a high school oratorical contest; 15,000 selected boys enrolled in 34 Boys' States in which they were taught the mechanics of American self-government; and with 400,000 boys under 17 playing in junior baseball.

The long-range child welfare objective was fixed as the physical fitness of American childhood, and the known total of $6,279,469.67 was expended in emergency financial aid to 629,993 needy children, mostly for food, clothing and medical treatments; a rehabilitation program recovered grants totalling $2,603,747.49 in contested benefits for disabled veterans and their dependents. Membership was at the highest point in the American Legion and its four affiliated organizations.

The 23rd annual national convention was attended by 200,000 members and their families in Milwaukee, Wis., Sept. 15–18, 1941. The convention went on record for repeal of the neutrality act, removal of geographic limitation on the movement of U.S. troops, indorsement of the foreign policy of the president and the congress, upholding the traditional U.S. policy of freedom of the seas, opposition to any appeasement toward the aggressor nations (Germany, Italy and Japan).

The 1,462 official delegates, representing 58 continental and outlying departments and four posts not attached to any department, named Lynn U. Stambaugh, Fargo, N.D., attorney, to succeed Milo J. Warner, Toledo, O., as national commander, and chose New Orleans, La., as the 1942 convention city.

National headquarters of the American Legion, and of its affiliated organizations, the American Legion auxiliary, the Forty

and Eight, and the Sons of the American Legion, remained at the War Memorial building, Indianapolis. The Eight and Forty has headquarters elsewhere in Indianapolis. Frank E. Samuel, national adjutant, and principal administrative officer of the American Legion, was re-elected by the national executive committee at its meeting in Milwaukee, immediately following adjournment of the national convention. (L. U. S.)

American Library Association.

This association is the official organization of librarians, library trustees and others interested in libraries. While most members are from the United States and Canada, all continents are represented in the membership of 16,000. The association was founded in 1876, and is the oldest and largest organization of its kind in the world. Headquarters are at 520 North Michigan avenue, Chicago. Charles H. Brown, Ames, Ia., was president for 1941–42, and Carl H. Milam was executive secretary.

The development of library service in the United States and Canada is the major objective of the association. Most recent figures reveal there are 47,000,000 people without public libraries in the two countries. The headquarters staff and many volunteer committees work to raise standards of library service, to maintain standards of professional training, to improve the status of the profession, and integrate its interests with those of the federal and local governments.

Committees contribute important service in book buying, analysis of reading interests, federal and international relations, library administration, microphotography, work with the blind and foreign-born. Of special significance during 1941 were the policies and programs for action, planned to adjust library service for maximum efficiency under defense and wartime conditions.

A policy statement, "Libraries and the War," was adopted at the annual midwinter conference, Dec. 28–31, 1941, and outlined the American public library's wartime program. Libraries will act as war information centres; sources of research material and books on technical and industrial skills; disseminators of authentic information about ideas and interpretations of events of vital importance to the civilian in World War II. Libraries also looked forward to a postwar "world order of decency, security and human dignity," in which the American people would make wise decisions based on knowledge the public library can supply.

In a statement to the press in Jan. 1942, Mrs. Eleanor Roosevelt, assistant director of the Office of Civilian Defense, endorsed the service of libraries as war information centres, and announced official participation by the Office of Civilian Defense along lines recommended by the American Library association.

More than 4,000 librarians and friends of libraries attended the 63rd annual conference in Boston, Mass., June 19–25, 1941. The theme of the conference was "Deeds, Not Words." Much time was devoted to the necessity of adjusting libraries to an enormous industrial expansion, a problem not then overshadowed by the library's wartime responsibilities for civilian information.

Awards.—The Newbery award for the best contribution to children's literature during 1940 was conferred on Armstrong Sperry's *Call It Courage*. Robert Lawson received the Caldecott medal for *They Were Strong and Good*, judged the most distinguished picture book for children published in the United States during 1940. Anne Eaton won the James Terry White award for her book *Reading With Children*. For the first time, two library trustees were officially cited by the association for their service to American libraries. They were Rush Burton of Lavonia, Ga., and William E. Marcus of Montclair, N.J.

National Book Drive.—During the conference preliminary action was taken on plans for a national book drive for soldiers and sailors, sponsored by the American Library association, United Service Organizations and the American Red Cross. Althea Warren, librarian of the Los Angeles public library, was named as national director. The campaign opened Jan. 12, 1942.

Publications.—More than 150 publishing projects were in various stages of completion during 1941. Of the total, 29 were published. Funds from the Carnegie corporation made possible the publication of 14 bibliographies and two surveys concerned with industrial and technical training for defense, the preservation of democracy and international understanding. Among books published during the year were *Introducción a la Práctica Bibliotecaria en los Estados Unidos* by Carnovsky; *Teacher-Librarian's Handbook* by Douglas; *Subject Index to Poetry* by Bruncken; a preliminary American second edition of *A.L.A. Catalog Rules* and *Administering Library Service in the Elementary School* by Gardiner and Baisden.

In addition to books, bibliographies, indexes and pamphlets the association publishes the *A.L.A. Bulletin*, a monthly which includes the annual reports; the *Booklist*, a semimonthly guide to the selection and purchase of current books; the *Subscription Books Bulletin*, a quarterly presenting critical estimates of subscription books and sets sold by canvassing agents; the *Journal of Documentary Reproduction*, a quarterly; *College and Research Libraries*, a quarterly published by the Association of College and Reference Libraries, a division of the A.L.A., and the *Hospital Book Guide*, a quarterly which evaluates books from the point of view of the invalid and convalescent.

Finances.—The association's endowment was in 1941 approximately $2,152,000. The income of the organization in 1940–41 (excluding cash balances of $45,160 on Sept. 1, 1940) was $369,240. About $194,220 was derived from membership dues, conference income, sales of publications, advertising, subscriptions, etc., and was used primarily for membership and publishing activities; $98,900 came from outside sources in the form of grants for specific purposes.

These grants supported such activities as relations with Latin-American libraries; provision of books for public libraries in Europe; purchase and storage of research material for the rehabilitation of scholarly European libraries after the war; publication of book lists; the national defense program. (O. M. PN.)

American Literature.

The course of American literature in 1941 did not differ markedly from the general directions of the year before, but tendencies already observable were strengthened by the flow of events. For example, the trickle of books on South America grew to a river, while increasing tension in the far east gave rise to the publication of a number of volumes discussing the position of the United States and Japan, and interest in the U.S. past continued unabated in fiction as well as nonfiction. In fact, the only strong trend in the novel continued to be toward the historical, although there were also a number of works of regional nature, and in several excellent series various rivers, cities and parts of the country found their students and historians.

The popularity of John Gunther's *Inside Latin America,* one of the most widely read books, might have been at least partly attributable to its author's reputation as a continental reporter, but it is safe to assume that the timeliness of the subject matter had much to do with its success. The latter quality, coupled with an excellent journalistic style, also played a large part in the reading of William L. Shirer's *Berlin Diary: The Journal of a Foreign Correspondent, 1934–1941,* the most popular of a number of similar publications. Of books concerned with U.S. history, Margaret Leech's *Reveille in Washington,* a detailed account of life in the nation's capital during the period of the American Civil War, won thousands of shocked and fascinated readers, and was also a landmark in the progress of social history, written with emphasis upon the details of daily living, rather than upon battles and politics. Of somewhat the same general nature was Carl Van Doren's *The Secret History of the American Revolution,* subtitled *An Account of the Conspiracies of Benedict Arnold and Others,* and based upon a study of important documents hitherto unexamined, a more scholarly and less popular work than that of Miss Leech, but one of first importance.

The increasing significance of Pres. Roosevelt's position in world affairs added interest to two books about the presidency, Matthew Josephson's *The President-Makers: The Culture of Politics and Leadership in an Age of Enlightenment, 1896–1919,* and Edward S. Corwin's *The President: Office and Powers,* with the subtitle *A History of Analysis and Opinion,* a thorough study. The president continued his own account of his stewardship in the second four-volume set of *The Public Papers and Addresses of Franklin D. Roosevelt,* presented with a special introduction and explanatory notes, and covering the years between 1937 and 1940, with the following separate titles: *1937: The Constitution Prevails; 1938: The Continuing Struggle for Liberalism; 1939: War—And Neutrality; 1940: War—And Aid to the Democracies.*

Another of the important publications of the year was *The Dictionary of American History* in five volumes, edited by James Truslow Adams, with R. V. Coleman as managing editor. It was designed to be a companion set to the famous *Dictionary of American Biography.*

In fiction, an average number of fresh new talents made their appearance, while older novelists contributed books up to their accustomed standards, although the year was without a startling novel, either from the point of view of exceptional popular success or artistic merit. A new short story writer of distinction, Eudora Welty, published her first collection, *A Curtain of Green,* with an introduction by Katharine Anne Porter, and also won second prize in the O. Henry Memorial competition.

Worthy of mention in poetry was the appearance of a number of long poems of merit, more or less evenly divided among poets of established reputation and younger people. Among these were William Rose Benét's autobiography in verse, often of high quality, *The Dust Which Was God,* Mark Van Doren's novel of pioneer days, *The Mayfield Deer,* John Gould Fletcher's story of Arkansas, *South Star,* Harry Brown's *The Poem of Bunker Hill* and Delmore Schwartz's *Shenandoah,* the title being taken from the name of the protagonist, a Jew born in the Bronx. Universal interest in aviation was evidenced by the popularity of Selden Rodman's excellent anthology of poems about flying, *The Poetry of Flight.* An important body of the work of Horace Gregory was represented in *Poems: 1930–1940,* and a complete collection of the verse of Ridgely Torrence in *Poems by Ridgely Torrence,* while all Edna St. Vincent Millay's sonnets were gathered into one volume called *The Collected Sonnets of Edna St. Vincent Millay.*

The Novel.—Of older writers of fiction, John P. Marquand continued his ironical and penetrating analysis of the New England scene and character with *H. M. Pulham, Esq.,* a novel about a Bostonian-cum-Harvard who longed for the fleshpots of Manhattan, but had to be content with the baked beans of his native city, while Ellen Glasgow produced another of her serious stories called *In This Our Life,* marked by her usual grasp of the fundamentals of the struggle for spiritual survival. The year saw the loss to American letters by death of Elizabeth Madox Roberts, whose last novel, *Not by Strange Gods,* gave further evidence of her unusual talent, although it did not reach the heights of her masterpiece, *The Time of Man,* and of F. Scott Fitzgerald, who left behind the unfinished manuscript of a novel, *The Last Tycoon.* Concerned with the career of a Hollywood magnate, it was published as a fragment along with *The Great Gatsby* and some selected stories, and served to emphasize the impressive and only partly realized possibilities of its author. The last of Thomas Wolfe's literary remains, a collection of fragments and stories called *The Hills Beyond,* seemed unlikely to bring about any change in the author's reputation.

JOHN P. MARQUAND published another best-seller about Boston, *H. M. Pulham, Esquire,* in 1941. He is pictured in his home in New York city, under Grant Wood's "Parson Weems' Fable"

Booth Tarkington, the most productive of the older writers of fiction, was represented by two titles, *The Heritage of Hatcher Ide,* a story of American youth in the depression, and *The Fighting Littles,* less important, but amusing. Robert Nathan also produced two of his exquisite short novels, *They Went on Together* and *Tapiola's Brave Regiment,* both allegories for these times. Ben Ames Williams, one of the most prolific writers of fiction in the whole history of American letters, was represented by *The Strange Woman,* perhaps his finest and most ambitious work, while Mary Ellen Chase's *Windswept,* another panel in her Maine series, was generally regarded as her best work. Edna Ferber's *Saratoga Trunk* was reliable Ferber, full of colour and action, and headed, like Louis Bromfield's story of old New Orleans, *Wild Is the River,* straight for Hollywood, with very few changes. Evelyn Scott's uneven and still distinguished talent was in evidence in *The Shadow of the Hawk,* and Josephine Herbst's *Satan's Sergeants* disclosed a pleasantly lighter side to the work of a novelist who has often seemed to suffer from an excess of social consciousness. Upton Sinclair's *Between Two Worlds* continued the story of our times begun in *World's End* in a readable fashion.

Of a round hundred novels that represented 1941's serious contribution to the annals of American literature, some 30 were historical, covering many parts of the U.S. and many periods of time. Carl Carmer, hitherto known as a poet and social historian, made his debut in this field with *Genesee Fever,* a well done story of post-revolutionary days in the part of the country which the author knows thoroughly, while Frank O. Hough continued his account of war in Westchester county with *The Neutral Ground.* Other novels of the early days of the republic included Tom Pridgen's *Tory Oath,* with the Scottish Cape Fear country as its background; *Captain Paul* by Commander Edward Ellsberg, a stirring fictionization of the career of John Paul Jones; *One Red Rose Forever* by Mildred Jordan, based on the life of William, called Baron, Stiegel, the famous glassmaker; *Waters of the Wilderness* by Shirley Seifert, a stirring romance with George Rogers Clark as the hero; *Green Centuries* by Caroline Gordon, a novel of early days in Kentucky; *Not Without Peril* by Marguerite Allis, the story of Jemima Sartwell, Indian captive, and the upper Connecticut valley from 1742 to 1805; and *Richard Pryne* by Cyril Harris, a super-spy story of Long Island and New York in the days of the Revolutionary War.

Two relatively unknown fiction writers swept to the front during 1941 with unusual books. One of them was Marcus Goodrich, whose *Delilah* was the tale of an over-age destroyer, with the Philippines as the background, which won universal praise from the reviewers for its originality, while the other was Budd Schulberg, whose *What Makes Sammy Run?* was a stinging portrait of a Hollywood producer. Other younger writers whose work brightened the literary horizon included George Stewart, whose *Storm,* coming at the end of the year, promised to carry over well into 1942 and perhaps to start a new literary genre as well; Josephine Pinckney, hitherto known as a poet, whose *Hilton Head* was an excellent historical novel of her own South Carolina; Maritta M. Wolf, whose *Whistle Stop* was a moving study of everyday people in a middle western community; Paul Engle, whose *Always the Land* marked the entrance into the fiction ranks of a good young poet; Mary King's *Quincie Bolliver,* the story of a girl in an oil town which had striking life and gusto—the oil town boom also found treatment in Edwin Lanham's *Thunder in the Earth*—and Robert Paul Smith, whose *So It Doesn't Whistle* was a shrewd and entertaining story of life in contemporary New York.

Short Stories.—The death of Edward J. O'Brien after 27 years of editorship of *The Best American Short Stories* marked the end of the work of a man whose taste for a certain type of short story had had marked effect upon a whole generation. The 1941 volume was completed by Martha Foley, of *Story* magazine, who will continue the anthology. Harry Hansen surrendered the editorship of the O. Henry Memorial Prize Short Stories to Herschel Brickell, whose first volume, the 23rd in the series, contained 20 stories, the prize winners being Kay Boyle's "Defeat," Eudora Welty's "A Worn Path," Hallie Southgate Abbett's "Eighteenth Summer" and Andy Logan's "The Visit."

Biography.—The important biographies of the year fell into two main groups, studies of famous families of great wealth, and of noted military and political leaders, principally of the revolutionary period. Among the first, the notable examples are Wayne Andrews's *The Vanderbilt Legend: 1794–1940,* a detailed account of this famous family and all its members; Harvey O'Connor's *The Astors,* which performs a like service for another clan of plutocrats; and *Alfred I. du Pont: The Family Rebel* by Marquis James, a full-length and colourful portrait of the most unusual member of the du Ponts of Delaware. In the second classification were *The Admirable Trumpeter: A Biography of General James A. Wilkinson,* by Thomas Robson Hay and M. R. Werner, a fine biography of one of the most complex and fascinating rascals in U.S. history; *Horatio Gates: Defender of American Liberties* by Samuel White Patterson, a strongly biased but important book about a neglected leader; *James Madison: The Virginia Revolutionary* by Irving Brant, an excellent full-length portrait of one of the most important of the founding fathers; and *Anthony Wayne* by Harry Emerson Wildes, an attempt to do justice to Mad Anthony, by a competent and scholarly biographer. Two naval commanders were given handsome treatment in Hulbert Footner's *Sailor of Fortune: The Life and Adventures of Commander Barney, U.S.N.,* and in Charles Lee Lewis's *David Glasgow Farragut: Admiral in the Making,* while a Civil War hero who was also found in the Spanish-American War was presented in full detail by John P. Dyer in *Fightin' Joe Wheeler.*

Other notable biographies of the year included Blanche Colton Williams's sympathetic and engaging life of Clara Barton, subtitled *Daughter of Destiny;* Garrett Mattingly's *Catherine of Aragon,* a triumph of American scholarship, since it was regarded as the best study yet made of Henry VIII's Spanish queen; *William Henry Welch and the Heroic Age of American Medicine* by Simon Flexner and James Thomas Flexner; *The Doctors Mayo* by Helen Clapsaddle, the full account of the careers of the magicians of Rochester, Minn.; *Mr. Dooley's America: A Life of Finley Peter Dunne* by Elmer Ellis, an excellent portrait of the creator of one of the best known of imaginary Americans and Irving Stone's *Clarence Darrow for the Defense.*

Rivers and Regions.—Books of a regional character have been published in ever-increasing numbers and 1941 had its full share. Additions to the excellent Rivers of America series, which was started under the editorship of the late Constance Lindsay Skinner and which was being carried on under the guidance of Stephen Vincent Benét, include *The Kaw: The Heart of a Nation* by Floyd Benjamin Streeter; *The Brandywine* by Henry Seidel Canby; and *The Charles* by Arthur Bernon Tourtellot. Other books about rivers, not in the series, included *Great River of the Mountains: The Hudson,* with photographs and text by Croswell Bowen, and an introduction by Carl Carmer, and *Flowing South* by Clark B. Firestone, more about the Mississippi. A fine new collection, called the American Folkway series, under the editorship of Erskine Caldwell, got under way with three excellent volumes, *Desert Country* by Edwin Corle, *Piñon Country* by Haniel Long and *Short Grass Country* by Stanley Vestal. Additions to the Ports of America series were *Northwest Gateway: The Story of the Port of Seattle* by Archie Binns, and *Baltimore on the Chesapeake* by Hamilton Owens.

Other important books in this field included Joseph Henry

Jackson's rousing history of early California, *Anybody's Gold: The Story of California's Mining Towns;* Dorothy Gardner's *West of the River,* the story of the Missouri country from the arrival of the first explorers to the coming of the first railway; J. Frank Dobie's *The Longhorns,* an account of the great days of range cattle raising in the west; Jeremiah Digges's *In Great Waters,* a book about the Portuguese fishermen of New England; *Shenandoah and Its Byways* by William O. Stevens; and *The Farthest Reach* by Nancy Wilson Ross, a book about Washington and Oregon. Vermont and North Carolina, mountain states north and south, inspire people to write books about them in quantities, and the latest crop included *The Reluctant Republic: A History of Vermont* by Frederick F. Van der Water; *Winter in Vermont* by Charles A. Crane, with many beautiful photographs taken by the author, and *The Covered Bridge* by Herbert Wheaton Congdon, with photographs by Edmund Homer Royce. Archibald Henderson wrote a two-volume history of his native North Carolina, *The Old North State and the New,* and Jonathan Daniels produced an impressionistic study in *The Tar Heels: A Portrait,* an addition to a new series of biographies of the 48 states. Oliver Carlson tried, with some success, to put all of California into *A Mirror for Californians,* and other books in this classification ranged from *Williamsburg: Old and New* by Hildegarde Hawthorne, the last volume illustrated by E. H. Suydam before his death, to *Sodom by the Sea: An Affectionate History of Coney Island,* by Oliver Pilat and Jo Rawson.

South America.—In addition to John Gunther's *Inside Latin America,* which found considerably less favour among South Americans than among Gunther's fellow countrymen, a number of good books on the neighbouring continent, its peoples and its problems, appeared during the year. Of those covering large areas with thoroughness were W. L. Schurz's *Latin America,* a sound and carefully accurate study, made by a veteran observer; Hubert Herring's *Good Neighbors,* which devoted most of its attention to the ABC powers, Argentina, Brazil and Chile, but which also covered the 17 remaining republics, and which was the result of long and patient study; *The Other America* by Lawrence Griswold, covering ten South American republics, with Panama and the Guianas thrown in, and written by a distinguished archaeologist and geographer; *A Pageant of South American History* by Anne Merriman Peck, covering the whole story from pre-Columbian days to 1941, and an indispensable book on the subject; Charles Morrow Wilson's *Central America: Challenge and Opportunity,* which adds Colombia, Jamaica and Cuba to its nations of middle America, and Carl Crow's *Meet the South Americans,* interesting reading, but much more superficial than any of the other volumes mentioned.

The question of hemisphere defense was also treated in several valuable books, such as Charles Wertenbaker's *A New Doctrine of the Americas,* which contains many sketches of the personalities helping to put the new doctrine into action, and which also discusses military and economic matters; *Strategy of the Americas* by Cushman Reynolds and Fleming MacLeish, explaining the paths of possible attack and indicating defense resources; *Hands Off!* by Dexter Perkins, a complete history of the Monroe Doctrine; and *United We Stand: Defense of the Western Hemisphere* by Hanson W. Baldwin, the noted military and naval expert.

Far East.—The surprise attack of the Japanese on Pearl Harbor might have been avoided if the numerous books on the far eastern situation had been read by the commanders of the American forces. Most surprisingly prophetic of these was *Hawaii, Restless Rampart,* by Joseph Barber, Jr., which revealed fully the activities of the Japanese fifth column. Florence Horn's book on the Philippines, *Orphans of the Pacific,* was equally wise in its predictions, while many other books revealed the attitude of Japan toward the United States. Among them were the work of the veteran newspaper correspondent, Hallett Abend, called *Japan Unmasked;* Wilfred Fleisher's equally well informed *Volcanic Isle;* Claude A. Buss's scholarly *War and Diplomacy in Eastern Asia;* and William C. Johnstone's *The United States and Japan's New Order.* A full discussion of the war strength of the two nations was set forth in *The Armed Forces of the Pacific: The Military and Naval Power of the United States and Japan* by Capt. W. D. Puleston, U.S.N., retired, somewhat optimistic in tone from the American point of view. Mark J. Gayn's *Fight for the Pacific* was much more pessimistic and therefore closer to the mark. Both are valuable sources of information. Other important books on the far east included Edgar Snow's *The Battle for Asia,* a history of the Sino-Japanese War by one of the most noted correspondents in the orient; Joy Homer's *Dawn Watch in China,* a young writer's account of Chinese youth in wartime; and Emily Hahn's *The Soong Sisters,* a lively biography of China's three outstanding women, the wives of Chiang Kai-shek and H. H. Kung, and the widow of Sun Yat-sen.

Belles Lettres.—The year produced at least one literary study of first magnitude in F. C. Matthiesen's *American Renaissance: The Art of Expression in the Age of Emerson and Whitman,* a long and profound discussion not only of the two giants mentioned in the title, but also of Melville, Thoreau and Hawthorne. Edmund Wilson's *The Wound and the Bow* consisted of seven studies in literature, ranging from Dickens to Hemingway, and was done with this critic's usual perspicuity. *The Opinions of Oliver Allston* by Van Wyck Brooks, set forth in an unconventional autobiography Brooks's thoughts on life and letters, and was a positive declaration of faith, which called upon writers to help make a better future. Literary biographies of note included *That Rascal Freneau: A Study in Literary Failure* by Lewis Leary, a book about the first U.S. poet; *American Giant: Walt Whitman and His Times* by Frances Winwar; and *Crusader in Crinoline* by Forrest Wilson, a life of Harriet Beecher Stowe.

Autobiography.—Among autobiographies of literary men, William Alexander Percy's *Lanterns on the Levee* was widely popular because it not only showed that a distinguished poet could write distinguished prose, but it revealed also a whole attitude toward life, that of a wellborn southerner, and it was a very plum pudding of anecdote. Ray Stannard Baker's *Native American: The Book of My Youth,* a kind of double autobiography, since Baker and his nom de plume, David Grayson, have led separate careers, was valuable not only as history, but as a setting forth of the American way of life. In *Young Man of Caracas* T. R. Ybarra, the well known journalist, wrote a charming account of his family, truly Pan-American, since his father came from Venezuela and his mother from Boston. Margaret Deland's *Golden Yesterdays,* memories of Pennsylvania and New England, had a delightfully reminiscent quality, and the second volume of Josephus Daniels' long autobiography, *Editor in Politics,* was filled with good reading, as was Irvin Cobb's *Exit Laughing* and Rex Beach's *Personal Exposures.*

Miscellaneous.—The most notable volume of letters of the year was *The Holmes-Pollock Letters: The Correspondence of Mr. Justice Holmes and Sir Frederick Pollock, 1874–1932,* which was edited by M. A. De Wolfe Howe and which had an introduction by John Gorham Palfrey, the civilized correspondence of two great men. (*See* also ENGLISH LITERATURE.) (H. BL.)

American Medical Association. The American Medical association includes more than 121,000 physicians. It is a democratic organization, with representation in a house of delegates to which

is elected yearly, on the basis of the number of physicians from each state, a given number of delegates. Its purpose is to guard and promote medicine in all of its branches. It maintains a department quite similar to the bureau of standards in Washington, D.C., in which are critically investigated and passed or rejected, drugs, medical apparatus, food and all types of materials which relate to medicine. It ascertains in these materials which are advertised whether or not they are what they purport to be in their advertisements, and if they are not, their advertisements are not accepted in any reputable medical journal. It maintains a council on medical education and hospitals, with investigators who are constantly critically observing medical schools to be certain that they are maintaining the standards which are required for grade A rating in medical schools. It publishes the *Journal of the American Medical Association* weekly, which has the largest circulation of any medical journal in the world. It also publishes 12 special journals such as the *Archives of Surgery, Archives of Internal Medicine,* etc. The officers of the association for 1941–42 were: president, Frank H. Lahey; president-elect, Fred W. Rankin; vice-president, Charles A. Dukes; secretary and general manager, Olin West.

The American Medical association supports an annual meeting with lectures of general interest, given by recognized authorities, for the first two days, and sectional meetings of special interest, including one for general practitioners, for the last three days of the meeting. Before these sections are read papers having to do with the new developments in medicine. At the same meeting it organizes and presents a scientific exhibit in which everything that is new in medicine is presented in exhibits, with outlines, charts, figures, moulages, X-rays, statistical data, and with the exhibitors present who are familiar with all of their details, to discuss and demonstrate them to those who desire to learn from them.

The American Medical association sent questionnaires to more than 180,000 physicians and tabulated under the punch card system more than 160,000 physicians as to their availability for military service. Doctors in various specialties were tabulated as to their specialty, but also rated as to their qualifications.

At the meeting of the American Medical association in Cleveland, a motion was passed by the house of delegates and forwarded to the president of the United States, the secretary of war, the secretary of the navy and the surgeons general of the army, navy and public health, advising the establishment of an agency for the procurement and assignment of medical personnel for the various departments of the government related to war. This agency, appointed by the president, was functioning in 1941 and was ready to supply medical men for the armed forces, selected through corps area, state and county committees, having in mind that no area is to be depleted and that the names be selected in terms of age, training and requirements of the armed forces.

The headquarters of the American Medical association in Chicago employs 630 persons who conduct its many bureaus and produce its publications. (F. H. L.)

Anaemia. Renewed attention was directed to the haemolytic anaemias (due to blood destruction). In 1941, studies were reported on march haemoglobinaemia, favism, paroxysmal nocturnal haemoglobinuria, Baghdad spring anaemia, bush-tea haematuria, and haemolytic reactions to transfusions from anti-Rh haemolysins, or from isoimmunization of group A_2 individuals against group A_1 blood. Haemolytic lysolecithin develops in stagnant blood. In the acute haemolytic anaemia following sulphanilamide or sulphapyridine poisoning, 30% of circulating blood corpuscles may be dissolved in 12 to 48 hours, resulting in shock. Haemoglobin is released from the cells and methaemoglobin and methaemalbumin are produced. Erythrocytes in the blood of patients with familial acholuric jaundice undergo autohaemolysis (self-blood destruction) more rapidly than normal red blood cells, in vitro, at 37°.

Red blood cell survival after storage up to 18 days is but little inferior to fresh blood when transfused into patients with anaemia and the cells may be detected in the circulation for from 70 to 90 days. Symptomatic haemolytic anaemia, secondary to dermoid cysts, chronic lymphatic leukaemia, Hodgkin's disease, lymphosarcoma, severe liver disease or pneumonia can be relieved only with the improvement of the underlying condition. The haemoglobinuria in blackwater fever appears to be due to the action of the abnormal amount of bile salts, released from the affected liver, on the red blood cells injured (decreased lytic resistance) by the malarial infection. Extensive studies on the technical aspects of blood preservation (bank blood) for transfusion in anaemia were reported. Blood transfusions may be given directly into the bone marrow. Among blood substitutes for restoring blood volume are pectin and isinglass. Transfusions of concentrated saline suspensions of red blood cells are effective in treating anaemia. "Universal blood" (group O) may be made safe for transfusion by the addition of group specific substances A and B. Combined universal blood (group O cells and group AB plasma) may be given to patients of any group without previous testing or subsequent reactions. However, danger is not present in giving blood from a universal donor directly to patients, regardless of the donor's serum agglutinins. The regeneration of blood in transfusion donors is eight times more rapid when iron is given than when medication is not given. After the loss of 500 c.c. of blood, the return to normal, with iron therapy, requires 11 days.

Anti-Rh factor in a mother has been reported as a cause of erythroblastosis foetalis in infants who are Rh-positive. Deprivation of placental blood in the newborn results in a lowering of the red blood cell count and a decrease in the haemoglobin content of the blood. Lysine is an essential amino acid in haemoglobin regeneration. Casein digests parenterally have been used to form blood plasma protein. The stimulus to haemoglobin formation is greater when anaemia is more severe and regeneration is proportional to the degree of anaemia. Haemoglobin regeneration in anaemic trout is more rapid after the feeding of fly maggots, than after liver. Primary deficiency macrocytosis appears in persons with deficient nourishment. A familial microcytic anaemia, refractory to treatment, was described in an Italian family.

Deficiency in natural prothrombin with prolonged bleeding time, as well as idiopathic hypoprothrombinaemia, have been found to be causes of haemorrhagic disease. Haemorrhagic anaemia of the newborn is prevented by the intravenous injection of 4-amino-2 methyl-1 naphthol hydrochloride (vitamin K) into the mother before delivery. Vitamin B has been recommended for the treatment of residual neurologic complications in pernicious anaemia. In mild hypochromic anaemia in the adult, the addition of 3 mg. of copper sulphate to iron and ammonium citrate does not increase the effectiveness of iron in haemoglobin regeneration. Arrest of haemorrhage is produced by contraction of blood vessels (capillaries) for from 20 to 120 min., during which time a clot forms and seals the opening. (R. Is.)

Anaesthesia. In Feb. 1941 the American Board of Anesthesiology, Inc., became a major independent board whereas previously it had been an affiliate of the American Board of Surgery. The officers were: president, Ralph M. Waters, Madison, Wis.; vice-president, Henry S. Ruth, Philadelphia, Pa.; secretary, Paul M. Wood, New York city.

In June 1941 the section on anaesthesiology of the American Medical association met for the first time at the annual meeting of the American Medical association in Cleveland, O. The chairman was Ralph M. Waters, Madison, Wis.; vice-chairman, Thomas J. Collier, Atlanta, Ga.; secretary, John S. Lundy, Rochester, Minn.

In 1941 the National Research council set up medical and surgical advisory boards. One of the subcommittees to the committee on surgery was the subcommittee on anaesthesia. The officers were: chairman, Ralph M. Waters, Madison, Wis.; secretary, E. A. Rovenstine, New York city. The members were: Lewis S. Booth, New York city; Ralph M. Tovell, Hartford, Conn.; and John S. Lundy, Rochester, Minn. This subcommittee made recommendations concerning anaesthesiology problems to the surgeons general of the army, navy and public health. They prepared a manual entitled "Fundamentals of Anesthesia" for the use of officers and others employing anaesthetic agents or supervising administration of them. This manual was published by the American Medical association. Thus the specialty of anaesthesiology was finally and for the first time formally established on a basis of a relative equality with other specialties.

"Recommended Safe Practice for the Use of Combustible Anesthetics in Hospital Operating Rooms," was an outline developed by the conference committee on operating room hazards. Their recommendations tended to renew confidence in cyclopropane and other inflammable anaesthetic agents in institutions in the United States where an attempt had been made to avoid the use of these agents, although because of their great value their loss was keenly felt.

The contribution of Lemmon of the method of continuous spinal anaesthesia was used in a greater number of cases. Reports of a number of variations in the technique of its use appeared. This is an outstanding development in anaesthesia and each year should see it gain in favour.

Use of intravenous anaesthesia continued to increase, and a new agent was being investigated in 1941 which, it is hoped, will be an improvement on evipal soluble (n-methyl-C-C-cyclohexamyl-methyl barbituric acid) and pentothal sodium (sodium ethyl [1-methylbutyl] thiobarbiturate). Indications for, and contraindications to, its use have not been established definitely. It is of the greatest value when it is combined with other agents and methods and when the dose of it that is used is not larger than from 1 gm. to 2 gm. The administration of oxygen or the mixture of half oxygen and half nitrous oxide considerably increased the usefulness of the method.

The activity of anaesthetists in connection with aspiration of material from the tracheobronchial tree during and after operation was greatly stimulated by reports of excellent results obtained when this procedure is available and is used early. Not only is it of value as a prophylactic measure, but it is of definite therapeutic value in the treatment of atelectasis.

Investigations were concerned chiefly with new anaesthetic agents, especially for intravenous use. An attempt was being made to explain why certain agents should be avoided in the presence of shock, not only in civilian practice but in military practice. (*See* also SURGERY.) (J. S. L.)

Anderson, Sherwood (1876–1941), U.S. author, was born Sept. 13 in Camden, Ohio. He was the third child in a family of eight and his father was a struggling harness maker. Young Anderson showed little interest in school; at 14 his schooling stopped and at 17 he became an itinerant housepainter. He wandered through the bustling midwestern states, keenly alive to the growth of industrialization in the '90s. In 1898 he joined the army, saw service in Cuba during the Spanish-American War and returned to Ohio a hero. He became manager of a paint factory, but, dissatisfied with office routine, he quit suddenly and went to Chicago where he worked in an advertising agency. There he met, through his brother Karl, a magazine artist, Chicago's literary titans—Dreiser, Sandburg and Hecht. Under their influence he wrote his first novel, *Windy McPherson's Son*, published in 1916. In 1919 he wrote *Winesburg, Ohio*, a collection of short stories about small-town life, regarded as his best and most lasting work. Later he bought a small-town weekly in Virginia and edited this paper for a while before turning it over to his son. Among his publications are *Tar* (1927); *Hello Towns* (1929); *Perhaps Women* (1931); *Beyond Desire* (1933); *Death in the Woods* (1933); *No Swank* (1934); *Puzzled America* (1935); *Kit Brandon* (1936), and *Plays* (1937). He died March 8 in Colon, Panama; he had been touring South America with his wife. (See *Encyclopædia Britannica.*)

Andrews, Frank Maxwell (1884–), U.S. army officer, was born Feb. 3 in Nashville, Tenn. He was graduated from West Point, 1906, became a cavalry lieutenant and was promoted through the grades to colonel in 1935. Gen. Andrews saw service in the Philippines, 1906–07, and in Hawaii, 1911–13. He was a major with the signal corps during World War I and served with the U.S. army of occupation in Germany, 1920–23. Upon his return to the U.S. he became executive officer of Kelly field, 1923–25, and was a member of the war department general staff, 1934–35. He was appointed temporary major general of the air corps in 1935 and major general commanding G.H.Q. air force, 1936–39. While in the latter post, Andrews piloted an army air corps amphibian

bomber 1,425 mi. from San Juan, Puerto Rico, to Langley field, Va., setting a new world's distance and straight-line record for amphibian planes. In 1939 he was named assistant chief of staff for all army air operations and training. In Sept. 1941 he was promoted to the rank of lieutenant general and head of the Caribbean defense command and the Panama canal department.

Angling. Women anglers in 1941 established four new marks in competition strictly for their sex. But it fell to men to contribute the year's two outstanding catches.

The most notable of these was a 737-lb. blue marlin, taken July 16 by J. Victor Martin at Bimini, British West Indies. This huge fish, caught on 39-thread line, established a new all-tackle record for the species. It was 13 feet 1 inch in length.

The second all-tackle world's record was set in the channel bass division by Captain B. R. Ballance, off Cape Hatteras, North Carolina, on Nov. 29. His catch tipped the scales at 75 lb. 8 oz., breaking a record that had existed for 12 years.

The outstanding women's catch was made by Mrs. Maurice Meyer, Jr., at Bailey's Island, Maine, Aug. 3, when she landed an 818-lb. tuna in 3½ hours to establish a new women's all-tackle record for this species. Second largest catch fell to Mrs. Sarah Farrington—a 659-lb. broadbill swordfish caught June 12 off Tocapilla, Chile. This new women's all-tackle record for the species also constituted an all-time record for 24-thread line.

Other women's all-tackle records established during 1941 were a wahoo of 110 lb., taken April 1 at Walker Cay, British West Indies, by Mrs. B. Davis Crowninshield on 39-thread line in eight minutes' time, and a dolphin of 58 lb. caught May 10 off Morro Castle, Havana, Cuba, by Mrs. James Simpson, Jr. This fish was caught on 9-thread line.

THE BOATS OF 800 FISHERMEN dotted Puget sound, Wash. at dawn on Sept. 7, 1941 as the annual Ben Paris salmon derby got under way. The prize catch of the day weighed 28 lb. 5 ounces

There were no new world's records established by fresh-water anglers. On the basis of all information available, the largest inland-water fish taken during the year was a muskalonge of 56 lb. 8 oz., caught by Robert D. Shawvan at Lake-of-the-Woods, Ontario. It fell short of the world's record established in 1940 by Percy P. Haver by a full six pounds. (B. Bh.)

Anglo-Egyptian Sudan. A territory under the joint sovereignty of Great Britain and Egypt in northeastern Africa, south of Egypt. Area 967,500 sq. mi.; pop. (est. Jan. 1, 1941) 6,362,852. Chief towns: (pop. Jan. 1, 1941) Khartoum, incl. Khartoum North (61,641); Omdurman (117,041); Port Sudan (26,255); Atbara (19,757); El Obeid (33,328). Governor-general: Lt.-Gen. Sir Hubert Huddleston; languages: English and Arabic; religion: Mohammedan.

History.—The security of the Sudan, which in view of its long common frontier with Eritrea and Abyssinia had been seriously threatened by the entry of Italy into the war, showed signs of rapid improvement at the beginning of 1941. The Italians had already been forced to leave Gallabat, and on Jan. 20 the Sudan government was able to reoccupy the important frontier town of Kassala. Meanwhile revolt was spreading in Abyssinia and by the end of January the Emperor Haile Selassie had moved into Abyssinia to put himself at the head of his own people. The Italians evacuated Kassala without offering serious resistance and retired to the mountains round Cheren after Agordat and Barentu had been taken early in February. Kurmuk, the last post on Sudan soil remaining in the hands of the Italians, was reoccupied Feb. 20. The Italian positions round Cheren were strong and were stubbornly defended; and it was not until March 27 that this city was taken after severe fighting. Asmara was not defended, and with the occupation of Addis Ababa on April 5 and the surrender at Amba-Alagi on May 20 the campaign so far as the Sudan was concerned was virtually at an end. There remained an Italian force at Gondar which was left undisturbed during the rainy season but which was compelled to surrender on Nov. 27. The fear of invasion and destructive air raids on Khartoum was thus removed. Throughout the campaign the Sudan defense force, consisting of Sudan native troops, performed its part in a manner which reflected credit on its members and its leadership. The strain on the resources of the Sudan, particularly the railways, caused by the movement and maintenance of large bodies of troops, was heavy but was adequately met. Commerce was active and the economic position of the country generally was good; the cotton crop found a ready market and trading in the other staple products of the Sudan was maintained. (B. H. B.)

Education.—(Jan. 1, 1941) Government schools: elementary schools 137, scholars 17,184; intermediate schools 11, scholars 357; Gordon Memorial college, scholars 1,308; state-aided Koranic schools 501, scholars 23,000; scholars at non-government (mission) schools, 12,925.

Banking and Finance.—In 1940: revenue £7,143,731; expenditure £7,052,899; public debt (Dec. 31, 1940) £10,023,570.

Trade and Communication.—In 1940 imports were valued at £E3,695,776; the value of exported merchandise was £E5,024,088, of which cotton accounted for £E2,894,833 and gum £E680,969; re-exports £E209,871. Communication: roads, suitable for motor traffic, all weather, *c.* 1,000 mi.; railways 1,991 route mi.; river service 2,325 mi.; motor vehicles licensed (1937) 4,354 cars, commercial vehicles and cycles; telephone subscribers (1938) 2,383.

Agriculture and Mineral Production.—(1938–39) Production: (in metric tons) cotton-seed (1939–40) 102,000; ginned cotton (1939–40) 50,600; millet (1937–38) 315,000; sesamum 33,200; maize 10,300; wheat 8,200; groundnuts 8,600; barley 1,600; gold (1938) 252 kg.

Anthropology. The most important development in anthropology in 1941 was the formation of the Society for Applied Anthropology to "promote scientific investigation of the principles controlling human relations and to encourage the wide application of these principles to practical problems."

Since 1920, anthropology has provided the unifying centre for the various specialists concerned with the study of human relations. This is due to the fact that anthropology is primarily a field science and deals with man as a whole, that is, with all aspects of human relations in all environments, all institutions and for all peoples. Because of this general point of view, anthropological methods and principles have more and more come to be used in the fields of business and political administration, in psychiatry, social work, education, etc., in the solution of practical problems of human relations. In order to further this development, and in particular, to encourage the testing of hypotheses as a routine process in the field of human relations, the Society for Applied Anthropology was formed.

The first issue of its journal, *Applied Anthropology,* is good evidence of the way in which the anthropologist deals with problems of his own society even more than with problems of the non-European groups. It includes an analysis of personnel and labour difficulties in industry together with suggestions as to ways in which they can be eliminated or kept under control ("Organization Problems in Industry," E. C. Chapple); an investigation of the lack of success of settlement houses in accomplishing their objectives, which is shown to be due to the failure to base their policies upon the actual situation in the groups whom they are trying to help, and also includes a case where the use of natural leaders from foreign groups brought about the successful completion of a project ("The Social Role of the Settlement House," William F. Whyte); a general discussion of the way a national morale program should be administered in the United States ("On Implementing a National Morale Program," Margaret Mead); an analysis of the failure of the program of the department of interior to make the Eskimo self-supporting in terms of a reindeer economy because of not adapting the program to Eskimo ways of life ("Native Economy and Survival in Arctic Alaska," Froelich Rainey); a detailed analysis of the administration of a resettlement project in western Pennsylvania with special emphasis on the human factors which condition successful planning ("Community Resettlement in a Depressed Coal Region," F. L. W. Richardson, Jr.); and a critical review of Roethlisberger and Dickson's, *Management and the Worker,* the first systematic use of anthropological methods in industrial research ("Towards a Control System in Industrial Relations," C. M. Arensberg).

The year 1941 also saw the publication of the first results of two important researches on present-day United States communities which had been under way for over a decade under the direction of Professor W. L. Warner of the University of Chicago, formerly of Harvard university (*The Social Life of a Modern Community,* W. L. Warner and P. S. Lunt, Yale University press, New Haven; *Deep South,* A. Davis, B. B. Gardner and M. R. Gardner, University of Chicago press, Chicago). The first of these is a study of a New England community, called "Yankee City," and the volume which appeared (other volumes were to follow) is a statistical and qualitative description of the six social classes postulated by the authors and a discussion of their interrelationships. *Deep South* is a similar study of a southern city and its rural hinterland in which the emphasis is on the relations of Negroes to the whites. According to the authors, each of these groups forms a caste, and the two castes are then subdivided into classes, much in the same way that Yankee City is said to be. After describing the differences in cultural activities of each class and caste, an analysis is given of the economic system of the area with special emphasis on tenancy, the plantation system as well as upon the kind of economic organization of the urban area.

Outside of the work done in the United States, a number of studies appeared in 1941 which were of interest in furthering knowledge of the relationships between non-European and European groups, the field commonly called acculturation. A general survey of the situation in Polynesia, Melanesia and Micronesia was completed by Felix Keesing (*The South Seas in the Modern World,* F. Keesing, with a foreword by J. B. Condliffe, Institute of Pacific Relations International Research series, John Day, New York). This book is an attempt "to define comprehensively the political, strategic and economic role these oceanic islands play in the world today, and especially the modern experience and problems of the peoples native to them." The book is, of course, extremely timely, but it is primarily important as an analysis of the way in which vast human and economic resources have been wasted through lack of skilful planning by responsible administrators, which is primarily due to the failure to base planning policies upon the existing systems of human relations in the several islands. Another book in the oceanic field which appeared in 1941 is a general survey of the Maori of New Zealand with the stress laid on their present-day situation (*The Maori People Today,* edited by I. L. G. Sutherland, Oxford University press, Oxford). The book provides the reader with an excellent account of the way these fine people have adjusted themselves to modern civilization.

In the field of acculturation, several other studies are of interest. In January, the *American Anthropologist* published a group of papers prepared under the leadership of M. J. Herskovits ("Some Comments on the Study of Culture Contact," M. J. Herskovits; "Some Aspects of Culture Change in the Northern Philippines," Fred. Eggan; "Culture Change among the Nilgiri Tribes," D. G. Mandelbaum; "World View and Social Relations in Guatemala," Sol Tax; "Acculturation among the Gullah Negroes," W. R. Bascom; "Some Aspects of Negro-Mohammedan Culture-Contact among the Hausa," J. H. Greenberg;—*American Anthropologist,* vol. 43, no. 1). Of particular interest is a study by J. F. Embree of the Japanese in Hawaii ("Acculturation among the Japanese of Kona, Hawaii," J. F. Embree, *Memoirs of the American Anthropological Association,* no. 59). There is considerable evidence given which can provide a background for administrative action and which can serve as a basis for future work in defining the status of different elements of the Japanese population in Hawaii. As Embree shows, the primary division in loyalties is between the older generation who look towards Japan for leadership and the younger who are loyal to the United States. For the purposes of the administrator, an analysis of the intra-family relationships of groups of Japanese would quickly provide the touchstone for testing where disloyalty would occur.

In contrast to the above methods generally used in the study of acculturation, Robert Redfield contrasted four communities in Yucatan, ranged in order of complexity, a village of tribal Indians, a peasant village, a town serving as trading centre between Spanish and Indian groups, and the city of Merida (*The Folk Culture of Yucatan,* R. Redfield, University of Chicago press, Chicago). Redfield found that there is a progressive increase, as one moves from the tribe to the city, in what he calls the "disorganization" of culture as judged by the fact that "meanings attached to acts and objects are relatively few and inconsistent," in the amount of "secularization," and in "individualization." As a result, he postulates for Yucatan in the future a merging of the Spanish and Indian influences and the formation of a class society with

racial and cultural differences disappearing.

Also of interest in the Central American field are two monographs, one on Guatemala and one on the Maya ("Economics of a Guatemalan Village," C. Wagley, *Memoirs of the American Anthropological Association,* no. 58; *Maya Indians of Yucatan,* M. Steggarda, publication 531, Carnegie Institution of Washington.

Other studies of general interest include Whiting's study of teaching and learning among the Kwoma of the Sepik river, New Guinea (*Becoming a Kwoma,* J. W. M. Whiting, Yale University press, New Haven) in which he describes childhood, adolescence and adulthood among these people and then analyzes the data in terms of learning theory; Ford's autobiography of a Kwakiutl chief (*Smoke from their Fires,* C. S. Ford, Yale University press, New Haven); and Schapera's discussion of the changes in the family system of the Kgatla of Bechuanaland after white influence for over a century (*Married Life in an African Tribe,* I. Schapera, with an introduction by B. Malinowski, Sheridan house, New York).

The year 1941 also saw the publication of the Sapir Memorial volume (*Language, Culture and Personality,* Essays in Memory of Edward Sapir, edited by L. Spier, A. I. Hallowell, S. S. Newman, Sapir Memorial Publication fund, Menasha, Wis.). This volume is divided into four major sections: the first deals with problems of linguistic classification, the second with linguistic behaviour and thought, the third with the development of culture patterns and the fourth with culture norms and the individual. The contributors, all former students of Sapir, provide an effective implementation of Sapir's point of view.

National Defense.—With the outbreak of war, and indeed for some time previous, anthropologists were increasingly concerned with activities connected with national defense. There are roughly three major headings under which these activities may be grouped First, the use of anthropologists as experts on those parts of the world in which they have done research and on which they are specially fitted, by the fact of doing field work, to give advice useful in military and economic warfare. Second, the use of anthropologists in the United States to assist in the many problems connected with the war. These include the study of industrial and community morale, the analysis of the various problems of ethnic groups, the study of food habits with its special emphasis upon raising the national standard of diet, the study of methods of administration and organization, etc. Third, the use of anthropologists in preparing the groundwork for a sound peace settlement. Many responsible persons believed that World War II was the result of ignoring the factor of human relations in the peace settlement after World War I. For that reason, several agencies, both governmental and private, began to gather information about the important countries in the world so that any organization set up after the war would be based upon known facts about the way in which human beings behave in the several countries in question. In this area, anthropologists played an important part in guiding the research activities. (E. D. C.)

Antimony. Although there was some production of antimony metal in the United States from domestic ores during World War I, since then ore production has been small, and the only metal recovery was that in antimonial lead. During 1941 there was a large smelter in Laredo, Tex., operating on Mexican ores and producing metal and oxide; a smaller plant near Los Angeles, Calif., has also been working Mexican ore, and other plants have been producing oxide from Mexican and South American ores. Output at both of the smelters was increased in 1941, and the Laredo plant reported the treatment of some domestic ore. In addition, a third smaller smelter was started at Kellogg, Ida., in March 1940. The output reported in 1940 included 494 short tons of recoverable metal in ores and concentrates, 2,077 tons of antimony in antimonial lead, part of which was recovered from foreign ores, and 11,421 tons of secondary metal. Imports of metal, needle antimony and oxide were reduced sharply, the respective amounts being 209 tons, 228 tons and none in 1940, while there was a two-thirds increase in the metal content of imported ores to 15,733 tons, 35% of which came from Bolivia, 4% from Peru, and 60% from Mexico. Ore imports at the end of the third quarter of 1941 were approximately equal to the total for 1940.

Chinese operations and shipments were seriously cramped by Japan, and in December with the United States at war with Japan, shipments from China might no longer be possible, although loans were made to China by the United States, payment of which was to have been made in antimony. Increasing demand in the United States would have to be met from Mexico and South America. Moderate tonnages of 50% ore were shipped from South Africa to England, and a plant for the recovery of by-product antimony from the treatment of other ores was installed at Trail, B.C., Canada. (G. A. Ro.)

Anti-Saloon League of America, Inc. The Anti-Saloon League of America is a nonpartisan, interdenominational, federated organization formed in 1895 for the purpose of temperance education and legislation. Its work in 1941 was devoted to public education on the alcohol problem, advocacy of total abstinence from all alcoholic beverages and of legislation to minimize the evils growing out of their use.

During 1941 the legislatures of 43 states met. Some states tightened restrictions on sales to minors; women bartenders were prohibited in Illinois and Pennsylvania; a number of states increased penalties for drunken driving, and New York and Oregon provided for chemical analyses of body fluids for had-been-drinking drivers involved in accidents. Numerous other restrictive laws were enacted. Many attempts to liberalize existing liquor laws were defeated.

In South Carolina the league supported the enactment of a statewide prohibitory law, which the people in an advisory referendum in 1940 had instructed the legislature to pass with a provision to replace liquor revenue by some other form of taxation. This measure failed of enactment because of inability to agree upon tax legislation to replace liquor revenue.

The league continued its efforts for local option during 1941. Preliminary returns indicated that no-licence prevailed in the elections in the proportion of 5 to 4.

Following the passage of the Selective Training and Service act on Sept. 16, 1940, the league urged the enactment of protective measures against vice and liquor in the vicinity of military and naval establishments. Congress enacted the May bill on July 11, 1941, authorizing the establishment of zones against commercialized vice in such areas. Owing to the opposition of the secretaries of war and the navy, a section which had been adopted by the senate authorizing the establishment of zones against the sale of alcoholic beverages was stricken out on reconsideration. The national headquarters are at 131 B. st. S.E., Washington, D.C. (E. B. Du.)

Anti-Semitism. As in the year 1940 the violent anti-Semitism which forms one of the fundamental points of the program and activities of national socialist Ger-

many not only continued unabated during 1941, but as a result of further national socialist conquests it spread to such an extent that it became a problem of an intensity and of dimensions unknown in history before, even in the so-called dark ages. While the possibilities for emigration diminished rapidly, until at the end of the period under discussion they totally disappeared, the national socialist regime not only intensified its anti-Semitic legislation to an unheard-of degree, but carried its treatment of the Jews with even greater violence into the newly conquered territories in the soviet union, territories which belong to the most densely populated, as far as Jews are concerned. Though the Jews had been deprived of all possibilities of economic earning in Germany, they were ordered on Jan. 20, 1941, to pay 15% additional gross income tax, "to compensate for their social inferiority." Jews remained barred from any professional or social contact with non-Jews and excluded from any visit to cultural or recreational places or institutions. They received no ration cards for clothing, shoes or coal, and much smaller rations for food than non-Jewish citizens. On Sept. 6, all Jews over six years of age were ordered to wear the Star of David in yellow on their coats or dresses with the inscription "Jew" in black and were forbidden to leave the areas in which they resided without special police permission. In the fall a systematic enforced transportation of all Jews living within the greater German reich began to eastern Poland. They were allowed to take with them only a minimum of clothing and money. All their property, personal belongings, clothing, furniture, money and funds were confiscated. The propaganda minister, Dr. Goebbels, promulgated a ten-point charter, inciting to an undying hatred of the Jews as the mortal enemies: "Anyone who still cultivates private relations with the Jew, belongs to him and must be appraised and treated the same as the Jew." Simultaneously similar curbs were applied to the Jews in the German-occupied countries of Netherlands and Belgium. The fascist government in Italy promulgated during the summer a Jewish "final law" aiming at the elimination of the Jews from any contact with life in Italy.

The fascist government in Vichy France imitated the national socialist legislation which had first been applied to the German occupied zone only. Sweeping racial curbs excluded Jews from practically all fields, not only of cultural, but also of economic activity. Xavier Vallat, a former extreme rightist member of the old parliament and a violent anti-Semite, was appointed on March 29 commissioner-general for Jewish questions. Under him the famous Nurnberg laws of the third reich were not only applied in all their rigour in German-occupied France, but introduced in rapid succession in the nonoccupied zone. The original Jewish statute, proclaimed by Vichy on Oct. 3, 1940, was amplified by a new law on June 14, 1941, and its strict measures were extended to all the French colonies under Vichy control, especially Algeria and Morocco. Only those parts of the French empire under control of the Free French remained free from anti-Semitism.

In view of the adherence of Japan to the "new order" it is not astonishing that for the first time an anti-Jewish association was organized in Japan on Sept. 7, under the leadership of Gen. Senjuro Hayashi with the motto "Jews are the enemies of the world." The war was regarded as a conflict between Jews and anti-Jews. Similarly in all other countries, especially in the United States and in Latin America, anti-Semitism became a characteristic of movements which supported directly or indirectly the "new order," and even of many persons and movements who wished to keep their own countries "neutral" in what national socialist Germans proclaim as a war of fascism against the Jews. National socialist anti-Semitism does not aim only at the extinction of the Jews; it serves, above all, as a most important weapon in the effort to undermine democracy and the will to resistance in the democratic countries. (*See* also FASCISM; JEWISH RELIGIOUS LIFE; JEWS, DISTRIBUTION OF; REFUGEES.)

Anti-Tank Guns: *see* MUNITIONS OF WAR.

Antonescu, Ion (1882–), Rumanian soldier and statesman, was born in Transylvania June 2 and fought with the Rumanian armies during World War I, after which he was promoted to the rank of colonel. He later became military attaché of Rumania in London and Rome, chief of the army's general staff and war minister. He was named prime minister by King Carol (*q.v.*) Sept. 5, 1940, in the midst of the disorders that followed the partition of Rumania. Antonescu's first act was to demand the abdication of Carol. The prime minister then assumed dictatorial powers and on Sept. 14, 1940, formally promulgated a totalitarian rule. He proceeded to restore temporary quiet in his country and established working relationships with the axis by signing the German-dictated pact of Nov. 23, 1940.

After subduing the Iron Guardist anti-Semitic riots of late Jan. 1941, Antonescu tightened his grip on the government, with German backing, and decreed the death penalty for acts of terrorism and disorder. In a controlled plebiscite of early March, Rumanians approved his regime by a vote of 2,490,944 to 2,816. Iron Guardists continued to be his principal opponents, and in April he announced a plot by the organization to assassinate him during Easter services in Bucharest. Antonescu began to mobilize his army early in June and marched against the U.S.S.R. on the same day (June 22) that Hitler's troops crossed the Russian border. Before assuming the title of generalissimo and commander of the Rumanian armies in Bessarabia, he was reported to have relinquished the premiership to his nephew, Mihai Antonescu. Rumanian casualties in 1941 were heavy, especially around Odessa, and in recognition of the country's sacrifices in the "anti-Bolshevik" crusade, Hitler personally conferred the iron cross on Antonescu Aug. 6, 1941. (*See* also RUMANIA.)

Apples. The commercial crop of apples in the United States in 1941 was estimated by the department of agriculture as 126,076,000 bu., compared with 114,391,000 bu. in 1940 and a six-year (1934–39) average of 125,310,000 bu. The commercial crop includes apples for processing and those sold for fresh consumption. The war affected seriously the export of U.S. fruit in 1941. In the year ending June 30, 1941 only 868,000 bu. were exported, compared with 3,216,000 bu. in 1940 and an annual average of 12,870,000 bu. in the six years, 1931–36. The 1941 apple crop in Canada was by preliminary estimate, 3,436,400 bbl., or about 20% below the 1940 crop.

Table I.—*U.S. Apple Production in Leading States, 1941 and 1940*

State	1941 bu.	1940 bu.	State	1941 bu.	1940 bu.
Washington	28,350,000	27,469,000*	Indiana	2,230,000	1,225,000
New York	16,120,000	12,936,000	Massachusetts	2,174,000	2,174,000
Virginia	11,505,000	10,660,000	Maryland	2,070,000	2,077,000
Pennsylvania	9,313,000	9,100,000	Idaho	1,908,000	2,160,000*
California	7,992,000	6,498,000	Delaware	1,794,000	1,909,000
Michigan	7,520,000	5,967,000	Missouri	1,708,000	1,616,000
Ohio	7,064,000	5,074,000	North Carolina	1,365,000	962,000
West Virginia	5,024,000	4,868,000	Connecticut	1,267,000	1,210,000
Illinois	3,509,000	1,876,000	Colorado	1,265,000	1,564,000*
New Jersey	3,150,000	3,296,000	Arkansas	1,025,000	765,000
Oregon	2,673,000	3,263,000	New Hampshire	817,000	925,000

*Includes the following quantities harvested but not utilized owing to excessive cullage: Idaho, 216,000 bu.; Washington, 1,280,000 bu.; Colorado, 50,000 bu.

A greatly reduced production in Iowa, Nebraska, Kansas and northwest Missouri was due to an Armistice day, 1940, freeze

which killed or damaged many trees.

Table II.—*Canadian Apple Production by Provinces, 1941 and 1940*

	1941 barrels	1940 barrels		1941 barrels	1940 barrels
British Columbia	1,415,100	1,081,000	Quebec	252,700	323,500
Nova Scotia	1,148,000	1,151,000	New Brunswick	67,000	53,000
Ontario	553,000	783,000

Aquariums. The New York aquarium closed its doors for the last time on Oct. 1. It was originally established in 1896 by the city of New York and had been operated by the New York Zoological society since 1902. This closure was considered necessary by the city, incident to construction work in Battery park. The recorded public attendance reached more than 84,000,000 persons from 1902 to 1941, inclusive. The bulk of the collections was distributed among the public aquariums in Washington, D.C., Philadelphia, Pa. and Boston, Mass.; the remainder were being held for public exhibition in a small display under construction in the New York Zoological park, to be opened in the early part of 1942. Research activities formerly centred at the aquarium were continued, in part at the New York Zoological park and in part at the American Museum of Natural History.

Other aquariums as far as reported or able to report were surviving. Collecting in all cases was greatly restricted and as the war continued they all, of necessity, became increasingly exhibits of localized collections. (C. M. BR.)

Aqueducts. The Colorado river aqueduct, constructed by the Metropolitan Water District of Southern California at a cost of approximately $200,000,000 extends 241 mi. from Parker dam on the Colorado river to Cajalco reservoir, 12 mi. south of Riverside, Calif. This aqueduct is capable of delivering 1,000,000,000 gal. daily to Los Angeles and 12 neighbouring coastal cities. With the last of the tunnels on the distribution system completed in 1941, the entire system totalling 392 mi. was in complete operation on Aug. 18, 1941. The Delaware river aqueduct, an 85-mi. pressure tunnel, being built by the board of water supply of New York, is an important feature of the $298,000,000 Delaware project which will add 540,000,000 gal. daily to New York city's water supply, thus increasing the supply 50%. The last of the major tunnelling jobs was holed through Sept. 17, 1941, completing 83.8 mi. of the aqueduct which will carry water 300 to 1,000 ft. underground from the watersheds of the Catskill mountains to Hillview reservoir on the northern boundary of New York city. Final holing through of the entire tunnel is expected in the spring of 1942. The All-American canal, biggest irrigation ditch in the United States, was in operation its full length during 1941. It carries water diverted from the Colorado river by Imperial dam a distance of 80 mi. into Imperial valley. With its 130-mi. Coachella branch canal, excavation for about half of which is completed, water will be supplied for 1,000,000 ac. of land in southern California. As a part of the Boulder canyon project, the All-American canal system was being built by the bureau of reclamation at an estimated cost of $38,500,000. The boring of a 13.1-mi. tunnel, which will carry water from the western slope through the Continental Divide to irrigate agricultural lands in northeastern Colorado was proceeding from both ends, with approximately one-third of the entire length either completed or under contract in 1941. Two tunnels of a 40-mi. aqueduct to convey water from Deer creek reservoir in Provo canyon over mountain slopes to Salt Lake City, Utah, were completed and work was under way on a pipe line in 1941. On the Central valley project in California the first 29 mi. of the 46-mi. Contra Costa canal were in use serving fresh water to industries, cities and farms; and work was in progress on the 40-mi. Madera canal to carry water from Friant reservoir to thirsty lands in the San Joaquin valley. A pipe line aqueduct project was put in service in 1941 bringing to Toledo, O., a supply of good water from Lake Erie to replace the old and unsatisfactory supply from the Maumee river. Construction of the Key West aqueduct, to extend from the mainland near Miami, Fla., to the tip of the Key West peninsula, a distance of 134 mi., was planned for immediate construction in Dec. 1941 to supply fresh water for the navy and the Key West civilian population. (*See* also CANALS AND INLAND WATERWAYS; DAMS; TUNNELS.) (J. C. PA.)

GRAVITY-ARRESTER of the Delaware river aqueduct, under construction in 1941 to add 540,000,000 gal. daily to the water supply of New York city. The series of steps slows the rush of water as it issues from a tunnel, so that it will flow smoothly through open-country channels

Arabia. Total area (est.) 1,000,000 sq.mi. Total pop. (est., 1937) 9,300,000; Saudi Arabia, 4,500,000; Yemen 3,500,000; Oman and Muscat 500,000; Kuwait 80,000; Trucial Sheikhs 80,000. Language: Arabic; religion: Mohammedan. Rulers: Saudi Arabia, King Abdul Aziz Ibn Sa'ud; Yemen, Imam Yahaya Muhammad Hamid ed Din; Oman and Muscat, Sultan Sayyid Said bin Taimur; Kuwait, Sheikh Ahmed Ibn Jabir al Subah.

History.—The year 1941 opened with the discovery of a conspiracy in Mecca against King Ibn Sa'ud's regime. In spite of its suspected instigation by the axis, it was not a very important affair and was easily suppressed; one of the personalities inculpated was executed and several others were imprisoned. This was practically the only untoward event in a year during which the Arabian peninsula remained as a whole tranquil and untouched by the war, except insofar as war conditions considerably reduced the number of pilgrims journeying to the Hejaz from overseas for the pilgrimage.

King Abdul Aziz Ibn Sa'ud continued to abide loyally by his friendship with Great Britain. Thus during Rashid Ali's revolt in Iraq in May he refused to render any help, either diplomatic or military, to the insurrectionary regime, in spite of Rashid Ali's move in sending one of his ministers, Naji Suwaydi, on a mission to Riyadh. He also interned German and Italian military refugees from East Africa. The Imam of the Yemen took up a more ambiguous attitude, and the activities of axis agents in his territories seem to have continued in 1941.

If the policy of King Ibn Sa'ud was pro-British, still more was it pro-Arab. He continued to take a close interest in the affairs of Syria, Palestine and other Moslem and Arab countries, and to do what he could to further the interests of their populations. His concern for the welfare of his fellow-Moslems was shown in the speech which he made during the pilgrimage in January. "Not one night," he declared, "do we lie down without anxiety for the cause of all Moslems, anxiety for the cause of our brethren of Syria, Palestine, Iraq and Egypt." His strong pan-Arab and Islamic sentiment was shared, it is probable, by a large proportion of his subjects, no less than by the imam of the Yemen and the other rulers of the peninsula. (A. H. Ho.)

TRADE.—With India (1938–39): Oman and Muscat, imports £283,987; exports £153,568; other states of Arabia, imports £485,932; exports £48,172. With the United Kingdom (1938): Saudi Arabia and Yemen, imports £94,960; exports £28,871; Oman and Muscat, Trucial Sheikhs and Kuwait, imports £40,262; exports £18,354. Total trade of Oman and Muscat (1938–39): imports Rs. 48,76,193; exports Rs. 33,31,939; Kuwait (1937–38): imports £410,812; exports £174,006. (*See* also ISLAM.)

Archaeology.

Western Hemisphere.—Archaeological field work, during the year 1941, diminished in the United States and increased in Mexico and especially in South America. Reallocation of Work Projects administration funds toward defense work reduced the number of state-wide archaeological projects; on the other hand, the Institute of Andean Research launched several important archaeological expeditions in Mexico, Central and South America.

In the United States archaeological efforts centred around the problems of: (1) the antiquity of man in North America; and (2) the more sedentary aboriginal cultures.

1. The association of man-made objects with extinct animal forms still constituted the earliest human horizon in America. No direct association of human skeletal remains had, up to 1941, been recovered. The Smithsonian institution excavated a new site ten miles south of San Jon, N.M., where various types of stone implements were found in association with both extinct and modern bison and extinct mammoth. The University of Michigan continued explorations of old beach lines formed some 10,000-15,000 years ago by the waters of Lake Huron, along the northern shore of that lake near Killarney, Manitoulin Island, Ont., Canada. Archaeologists from the University of Pennsylvania museum excavated Yuma sites in southwestern Wyoming near the town of Eden.

2. Sedentary aboriginal cultures:

In Alaska the American Museum of Natural History continued explorations at an important site known as Ipiutak on a barren gravel spit of Point Hope, 130 mi. above the Arctic circle. More than 500 tombs were excavated in an area of six miles leading from the ancient town. The Ipiutak culture is distinguished by its ivory art, finely chipped flat tools, and emphasis on land hunting gear. Laboratory analysis of the artifacts and human skeletal material may furnish valuable information concerning the migrations from Asia to North America.

The Eastern Washington State Historical society, the University of Washington and Washington State college combined efforts in continuing an archaeological survey near Hellgate, which revealed two distinct levels of occupation. Other sites were excavated between Kettle Falls and the Canadian boundary. The Los Angeles museum continued a survey and excavation of caves and shell middens among the Channel Islands off the coast of California. One cave at the southern end of San Clemente Island produced drilled and tarred planks from a plank canoe, fish harpoons, woven cloth, fishhooks, sea otter robes, etc.—material similar to that obtained from the natives by Capt. Vancouver in 1793. The University of California collected archaeological specimens from vated in the coast region north of Golden Gate. The desert laboratory of the Southwest museum worked two large sites near Twenty-nine Palms, Calif.

The University of New Mexico explored small house ruins in Chaco canyon. The Field Museum of Natural History continued excavations of an important site near Reserve, N.M. In a large rock shelter on the Papago Indian reservation, near Tucson, Ariz., significant additions were made to the prehistoric chronology by the University of Arizona. Within the 15 ft. of trash deposit a record was obtained, extending from modern times back through pre-pottery and pre-agricultural levels. The Amerind foundation continued work at Tres Alamos on the San Pedro river in southeastern Arizona. The Carnegie Institution of Washington sponsored excavation of a Basket Maker II site along the Animas valley near Durango, Colo. The Colorado Museum of Natural History continued archaeological explorations in western Colorado. The University of Utah carried out extensive surveys and some excavations in central and northern Utah.

The North Dakota Historical society proceeded with an archaeological survey and exploration of Mandan and Arikara sites along the Missouri river in central North Dakota. The museum of the University of South Dakota excavated more than 200 protohistoric Arikara house sites, refuse middens and a smaller fortified village along the Missouri river in Hughes county, S.D. Excavations by the Nebraska State Historical society indicated that maize was cultivated by some of the earlier cultural horizons. Excavations were directed in Oklahoma by the state university.

The University of Minnesota excavated sites at Lake Shetek in southwestern Minnesota, and other villages at Tuttle and Fox lakes near the Iowa line in central Minnesota. The University of Missouri carried on excavations of Siouan sites in Missouri. The Academy of Science of St. Louis made archaeological investigations in Jefferson and New Madrid counties in eastern Missouri. In Illinois the state museum and state parks division excavated a mound within the famous Cahokia mound group near East St. Louis; and the University of Chicago continued large-scale explorations at the Kincaid site in the southern part of the state. The Indiana Historical society carried on excavations throughout 1941 at the Angel site in southwestern Indiana. The Ohio State museum directed the excavation of a small Adena mound north of Chillicothe, O.

Under the sponsorship of the University of Kentucky, archaeological excavations were begun in the area to be flooded after the building of the Kentucky dam by the Tennessee Valley authority in the southwestern part of the state; other important excavations were completed in central and western Kentucky. The University of Tennessee directed the excavation of other basin sites to be flooded by the building of Tennessee Valley authority dams, work being concentrated in the Watts Bar dam and on the Tennessee side of the Kentucky dam reservoir areas. The national park service sponsored excavations of small sites within the Ocmulgee national monument at Macon, Ga. Most of the agencies in the Mississippi river valley were assisted by labour furnished through the Work Projects administration.

Historical archaeological excavations at Jamestown island, Va., by the national park service, continued to reveal numerous objects associated with the early 17th century settlement on the island. Similar excavations near Plymouth, Mass., were inaugurated under private sponsorship in connection with the remnants of houses erected by the Pilgrims. The Massachusetts Archaeological society tested early Indian occupation sites in various sections of eastern Massachusetts. The Long Island chapter of the New York Archaeological association explored a section of an important site on the north branch of Long Island. Vassar's Hud-

zons along the Hudson river in New York. The Pennsylvania Historical commission recovered evidence of Hopewell-like cultural material near Warren in northeastern Pennsylvania.

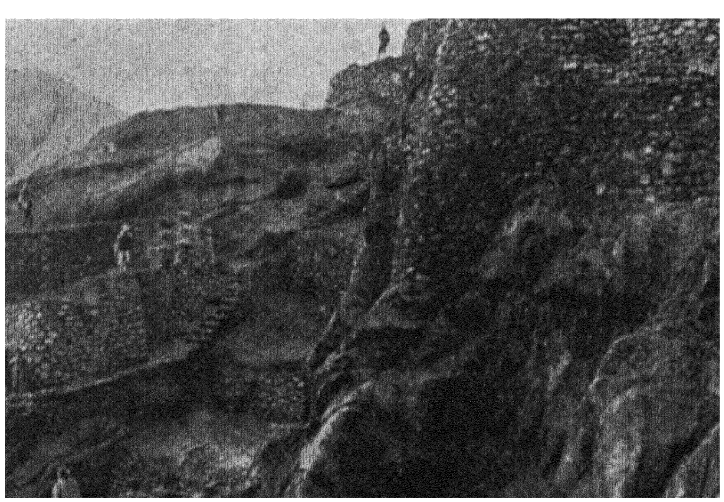
The Smithsonian institution and the National Geographic society jointly sponsored archaeological excavations at a large prehistoric site at Cerro de las Mesas in the southern part of Veracruz, Mex. Two sculptured calendar stones with dates in the first and fourth katuns of the Maya calendar were uncovered. More than eight tons of cultural material were obtained through stratigraphic excavations. A remarkable cache of 782 specimens of precious jade—some the finest examples of sculptured jade from the western hemisphere—was discovered in one of the large mounds. The Smithsonian institution also sponsored an archaeological expedition in the state of Coahuila in northern Mexico, where intensive excavations in two caves and one rock shelter produced well preserved cultural material consisting of feathers, baskets, sandals, throwing sticks, fur robes, grooved clubs and desiccated bodies. The Direccion de Monumentos Prehispanicos of the Mexican government directed explorations in Yucatan, Palenque, Monte Alban, Cholula, Michoacan and Hidalgo; other organizations sponsored work near Acapetlahuaya and in the state of Jalisco.

The Peabody museum of Harvard university directed research upon Chiriqui ceramic types in Panama. Middle American Research institute of Tulane university sponsored an archaeological survey in Honduras and Costa Rica. Carnegie Institution of Washington included in their archaeological program explorations in Guatemala, Honduras, Salvador and Nicaragua, where a large section of buried volcanic strata containing human footprints was uncovered in such a manner as to preserve these imprints of man *in situ*.

Under the direction of the Institute of Andean Research archaeological expeditions were inaugurated in the following states of South America: Venezuela, Colombia, northern Peru and Ecuador, southern Peru and the north Chile coast, southern Peru and the Bolivian highlands. These excavations were made possible through a grant from the Co-ordinator's Committee on Commercial and Cultural Relations Between the American Republics and the wholehearted co-operation of archaeologists in those states of South America. The Peruvian government continued archaeological explorations near Lima, especially at Pachacamac, Tambo Colorado in Pisco, and a site in the Nazca valley. Other states in South America continued their archaeological explorations.

BIBLIOGRAPHY.—Many technical archaeological reports were published during 1941 (vol. 43, *American Anthropologist*, and vol. 7, *American Antiquity*). The most outstanding publication for 1941 was *Aztecs of Mexico*, by George C. Vaillant, which describes, on the basis of archaeological evidence and historical documents, the origin, rise and fall of the Aztec nation (1941). (F. M. SE.)

SECTION of "the city above the clouds," one of the two lost Inca cities discovered near Cuzco, Peru by the Wenner-Gren expedition in 1941. The granite houses, walls and stairways are remarkably well preserved



Eastern Hemisphere.—In a very real sense the following summary of old world archaeological activity during 1941 is a tribute to those scientists who, in spite of the war, managed to make significant contributions to knowledge. The list is by no means exhaustive, since communication with several countries was virtually impossible. In addition to many new discoveries, eight important books were published, notwithstanding the fact that several of the authors were actively engaged in war work. Indeed the war provided many archaeologists with an opportunity for assimilating the tremendous bulk of new material that was brought to light since 1930. At the conclusion of this article a bibliography is given for those desiring further information; other references are cited in the text.

The Palaeolithic Period.—Further details were published by *Time* concerning the Altamira-like cave paintings from the Grotte de Lascaux, near Montignac in the Dordogne region of south-central France, the discovery of which was announced in 1940. Six of the scenes, including one 39 ft. long showing a herd of woolly horses, two goats and a wild cow, are reproduced in the *Time* article, which should be consulted by all students of primitive art.

Dr. F. W. Wulsin's book, *The Prehistoric Cultures of North-West Africa*, published by the Peabody museum of Harvard university, is the first complete account of the archaeological material from Tunisia, Algeria and Morocco that has ever been compiled. An enormous body of facts, especially those dealing with the Old Stone Age, was collated and synthesized by the author. This book, intended primarily for reference purposes, demonstrates the important role played by northwest Africa from early times down to the historic period in the diffusion of culture into Europe. It likewise points the direction which future research should take in this region by emphasizing the existing problems.

The Mugharet el 'Alyia (High cave), an important cave in Tangier, northwest Africa, which contained both atypical Upper Palaeolithic and Neolithic levels, as well as a mandible fragment and a molar tooth of Neanderthaloid affinities, was in 1941 completely excavated. In 1939 Prof. Carleton C. Coon of Harvard university dug a large trench through the deposits, but the war prevented him from returning to finish the work. However, in spite of very difficult circumstances, this was successfully achieved by Dr. Ralph Nahon and Hooker Doolittle, both former residents of Tangier. The material was placed in 1941 in the Peabody museum, Cambridge, Mass., where the complete excavation report was being prepared for publication by Bruce Howe.

At Sidi Abderrahman, near Casablanca (Morocco) on the Atlantic littoral of northwest Africa, Prof. Breuil announced that MM. Neuville and Ruhlmann had discovered an important Lower Palaeolithic archaeological horizon. The latter yields large flakes manufactured by the so-called Clacton technique in association with hand axes of Abbevillian type. Since the site is situated on an ancient dune 90 mi. above present sea level, and since the implements are *in situ* in it, Sidi Abderrahman furnishes definite evidence that western Morocco was occupied by man during early post-Sicilian times.

In 1941 Prof. C. van Riet Lowe, director of the bureau of archaeology of the Union of South Africa, and E. J. Wayland, director of the geological survey of Uganda, jointly prepared an extensive report covering the Pleistocene geology and Palaeolithic archaeology of Uganda. It is understood that the conclusions of these authorities differ in several fundamental respects from those arrived at by T. P. O'Brien, whose book on *The Prehistory of Uganda Protectorate* appeared in 1939. The report, already submitted to the Uganda government, was planned to be published after the war.

To provide a basis for dating archaeological material in South Africa (not only finds directly associated with recognized geo-

logical horizons, but also those obtained by excavation in cave sites) H. B. S. Cook summarized the known facts pertaining to the Late Cenozoic deposits of the region. His report, *A Preliminary Survey of the Quaternary Period in Southern Africa,* published by the bureau of archaeology of the Union of South Africa, includes a discussion of raised beaches, river terraces, non-fluviatile deposits, Pleistocene mammals and caves. The author's tentative conclusions regarding the correlation of the main events are outlined in tabular form.

A large and carefully documented series of palaeolithic implements, comprising Acheulean, Levallois and Upper Palaeolithic types, was collected by Peter D. Cornwall, working for the University of California and Harvard university, on the mainland of Arabia adjacent to the island of Bahrein. The assemblage also includes mesolithic, neolithic and Bronze Age material, in addition to the contents of graves contained in tumuli roughly dated 600–300 B.C. The importance of Cornwall's work in the hitherto little known archaeological region cannot be overestimated.

Preliminary excavations at the cave of Amir-Temir in the mountains of Uzbekistan established the presence of three palaeolithic horizons in central Asia. The oldest of these, very similar to the upper level of Teshik-Tash, was referred to the Mousterian. The work at this place, the second palaeolithic site to be reported from this important region, was being directed by Dr. A. P. Okladnikov of Tashkent.

All students of early man welcomed the publication of Dr. H. de Terra's views on the Pleistocene of China (*Pub. No. 6* of the Inst. Géo-Biol., Peking). The most important single contribution of the work is that it focuses attention on the evidence of former glaciations in China. In the far east, as elsewhere in the old world, the Pleistocene climate underwent a series of major fluctuations, making it possible to date early human fossils as well as Stone Age implements more precisely than heretofore. According to de Terra, the *Sinanthropus* deposits at the famous site of Chou Kou Tien may now be correlated with the 2nd Interglacial period in northwest India.

Fossil Man.—A. D. Lacaille of the Welcome Historical Medical museum, London, reported that he has been working on a large collection of Lower Aurignacian (Châtelperronian) flint and bone implements from the important site of Châtelperron. Associated with this material, excavated some years ago, a hitherto unpublished Upper Palaeolithic skull was "discovered," which was being studied by Prof. Morant. Of interest are the facts that the vault is extraordinarily thick and that it is very like the Combe-Capelle specimen in many respects.

In a communication to the writer, Prof. C. van Riet Lowe stated that his assistant, Dr. B. D. Malan, excavated a cave with great success in the Union of South Africa. The site yielded "a Neanderthaloid skull with quantities of implements made on flakes struck from advanced Levallois (Middle Stone Age in South Africa) cores—plus a good fauna." This discovery is important for two reasons: (a) the human fossil is the first Neanderthaloid to be found in a definitely dated horizon in southern Africa (the age of Rhodesian man is uncertain), and (b) it is the only skull that has ever been found in this region in an undisputed Middle Stone Age context. The Carnegie Institution of Washington announced that Dr. G. H. R. von Koenigswald had discovered a very heavy human mandible belonging to an absolutely new type of fossil man in the upper part of the Lower Pleistocene beds (Djetis horizon) of Java. In several respects this new specimen, the second Lower Pleistocene human fossil to be found in Asia, differs from *Pithecanthropus erectus*—the Java ape-man. Presumably it would be accorded a new generic status.

Neolithic and Later: The Near East.—Florence E. Day established that the Islamic Omayyad (A.D. 661–750) ceramics found at Tarsus in Cilicia were actually manufactured at the site. This green glazed pottery has affinities with T'ang dynasty (A.D. 617–906) wares of China—evidence that further confirms the intimate contact between the near and far east which existed at this period. For on the basis of A.D. 8th century Chinese records, it has been revealed that there were Chinese artisans at Kufa in Iraq during T'ang times.

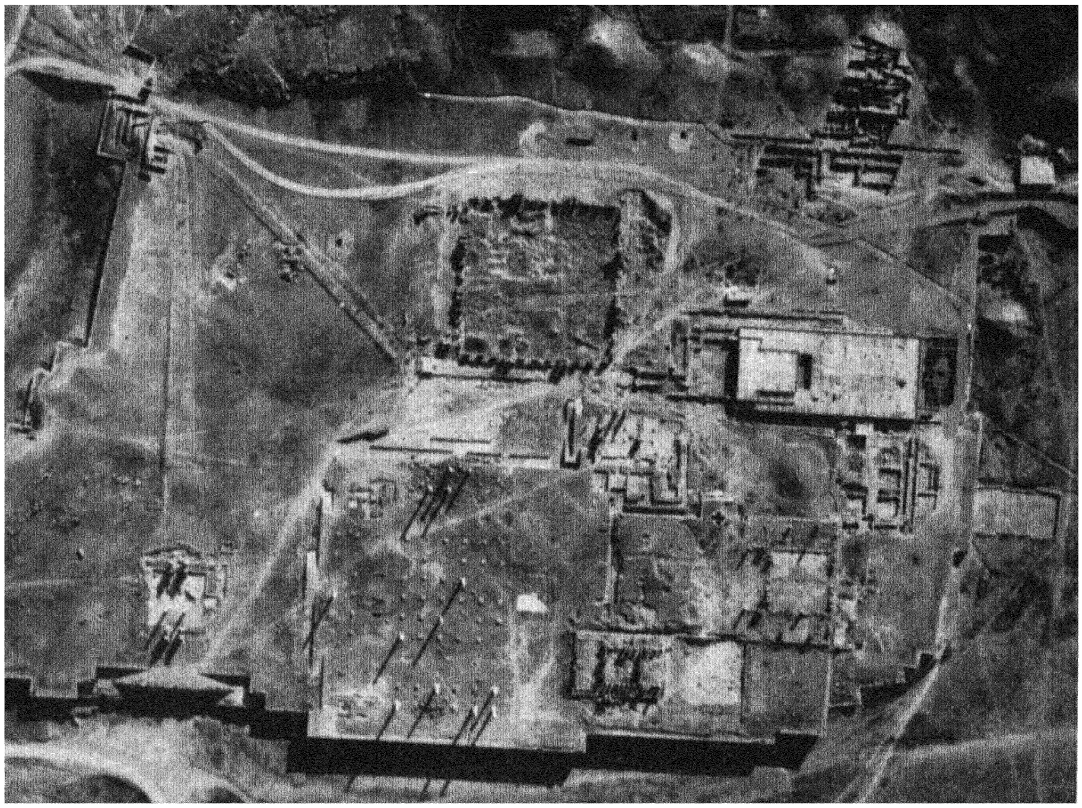
On the northern outskirts of modern Hama, situated in Syria on the Orontes river halfway between Damascus and Aleppo, excavations were made on a large mound by the Carlsberg foundation of Copenhagen from 1930–38. The work, details of which were available in 1941 for the first time, was directed by Dr. H. Ingholt. Twelve different levels of civilization (the last city was destroyed by Sargon in 720 B.C.) were revealed. The oldest level, which goes back to the 5th millennium B.C., overlies virgin soil, and it is characterized by burnished or fluted brown and black pottery. Stratum 11 contains characteristic Tel Halaf painted ware, together with stone artifacts, a terra cotta seal and an animal figurine of clay.

Above these neolithic strata are ten more levels which throw light on the development of Bronze and Iron Age culture at ancient Hama.

In Palestine joint excavations by the American School of Oriental Research and the Hebrew university, near the school's property in Jerusalem, uncovered the remains of the old city wall. A stretch 23 mi. long, including a large tower, was exposed. This segment is on a line with previously discovered remains which together cover a total length of some 600 mi. This so-called "third wall," referred to by Josephus, was built by Herod Agrippa and the Jews between A.D. 40 and 70. The pottery found overlying the portion discovered in 1941 demonstrates that by the Byzantine period this old wall had been completely stripped of its superstructure blocks for building purposes.

Europe (General).—From the point of view of European archaeology it is difficult to overemphasize the importance of C. F. C. Hawkes's book, *Prehistoric Foundations of Europe to the Mycenean Age.* The author's conclusions differ in several respects from those of Prof. V. G. Childe, whose second edition of *The Dawn of European Civilization* was hitherto the only up-to-date general book of a similar nature that had appeared in the English language. Both Hawkes and Childe stress the importance of the principles of diffusion and geographical factors with regard to the interpretation of the development of culture. Both attempt to synthesize the sum total of the evidence—social, cultural and economic—rather than certain classificatory abstractions. Although the scope of Hawkes's book is broader than that covered by Childe, there are available for students of the prehistoric aspects of occidental civilization two authoritative and unbiased accounts of the cultures that flourished in Europe up to the middle of the 2nd millennium B.C.

THE "THRONE OF SOLOMON," a fortress in northwestern Iran, as seen from the air by members of the 1935–37 expedition of the Oriental Institute of Chicago. This photograph appeared in *Flights over Ancient Cities of Iran,* published in 1941



DETAILS OF THE ANCIENT PALACE TERRACE of the Persian kings at Persepolis stand out in bold relief in this aerial photograph taken by the Oriental Institute of Chicago during its expedition of 1935–37 and published in 1941 in *Flights over Ancient Cities of Iran*

Cyprus.—On the basis of new data obtained by careful excavation at the stratified site of Kourion, it was possible to study the history of the script used in Cyprus during the Classical period. According to Dr. J. F. Daniel, this was the last direct descendant of the Minoan linear scripts. At Kourion it first appears in the Late Cycladic I-A level and remains in use through L.C. III-A times—from about 1500–1150 B.C. Since the characters are derived directly from the Minoan linear script A and are devoid of Helladic influence, the new evidence demonstrated that the Late Bronze Age syllabary of Cyprus cannot have been introduced by Achaean colonists.

Greece.—Prof. W. B. Dinsmoor's detailed analysis of the dates when architectural and sculptural repairs were made on the temple of Zeus at Olympia resulted in his recognition of the fact that these repairs were rendered necessary by an earthquake which occurred during the first half of the 2nd century B.C. Thus it was shown that the much disputed substitute statues (*Ersatzfiguren*), discovered more than 60 years ago among the pedimental sculptures of the temple, may be dated between 169 and 165 B.C.

Italy.—In early 1941 mention was made of a steatopygous statuette, found near Reggio Emilia and originally attributed to the Upper Palaeolithic period. Subsequent excavations at this site, however, revealed that the locality where the statuette was discovered—Chiozza di Scandiano—is an extensive neolithic cemetery containing numerous graves. These yielded implements of flint and polished stone, as well as typical neolithic pottery. Since the figurine was undoubtedly associated with one of these burials, views regarding its antiquity based on typological analogies have had to be somewhat modified.

An exhaustive study of the published reports dealing with excavations at Terra Mare settlements in northern Italy, as well as a complete analysis of all the important collections from those sites, convinced Gösta Säflund (*Skrifter Utgivna av Svenska Institutet i Rom*, vol. vii) that the plan of the typical Terramara, as reconstructed by Pigorini (on the basis of his 19th century work at Castellazzo), is only a figment of the excavator's imagination. For in reality a Terramara is a squalid Bronze Age village containing round or rectangular huts, which may or may not be raised on piles. As Dr. G. M. A. Hanfmann pointed out in his review of Säflund's book (see *Amer. Jour. Arch.*, xlv: 308–314 [1941]), those sites cannot conceivably be regarded as the forerunners of Roman camps. Nor does the evidence uphold Pigorini's theory that the Terra Mare were the originators of metal working in northern Italy. From a chronological point of view the Terra Mare arrived in Italy about the middle of the 2nd millennium B.C. (1600 B.C. at the very earliest) and began their decline during the Iron Age invasions (*c.* 900 B.C.), according to Hanfmann. On the basis of cultural analogies, this group is to be regarded as representing a prehistoric infiltration of people from central Europe during Bronze Age times.

As a result of building and constructional work, including the excavation of a deep-level underground railway, many new details pertaining to ancient Rome came to light. Among these were the remains of the temple of Bellona, dedicated a few years after it was vowed by Appius Claudius in 296 B.C.

The year 1941 witnessed the culmination of the huge official project for uncovering the major portion of Ostia, the port of ancient Rome, on which Guido Calza and his staff were engaged for some years. During the final season a large courtyard, without arcades and surrounded by more than 20 rooms, was uncovered at that site. Several fine examples of statuary belonging to the A.D. 2nd and 3rd centuries were found.

Portugal.—European archaeologists were eagerly awaiting further information concerning Prof. H. Breuil's survey of prehistoric sites and ancient monuments conducted on behalf of the Portuguese government. It was understood that Breuil's report would be published in Lisbon.

England.—Although the war put a temporary stop to archaeological research in England, it had by no means halted intellectual activity. Indeed it offered an opportunity for synthesizing the tremendous collection of facts that had been accumulating since 1932. Two of the foremost British archaeologists—Prof. V. G. Childe and Dr. Grahame Clark—produced books of a fundamentally different nature. Childe's *Prehistoric Communities of the British Isles* was intended for students of European archaeology, whereas *Prehistoric Britain* by Dr. Clark was written primarily for the general public. Each authority stressed the importance of the social life of prehistoric man as the key to interpreting problems involving cultural development, economic activity and chronology—a far cry from the now obsolete approach based entirely on typological considerations.

Scotland.—Prof. V. Gordon Childe of Edinburgh university announced that he had successfully dug out a Viking house at Freswick, which was brought to light during the course of commercial excavations. The site belongs to the A.D. 13th century or later.

Prof. Childe's survey of the relation of chambered cairns to recent settlement on Rousay disclosed the interesting fact that each group of cairns corresponds closely to a recent township (croft) in the islands. This suggests that an economy very similar to that of the 20th century characterized Late Bronze Age life on Rousay. The cairns themselves do not appear to be the burial places of rich chieftains, but rather genuinely communal.

Ireland.—In Eire pollen analysis as a means of accurately dating archaeological finds from bogs and other unaerated deposits was making rapid strides. Drs. Mitchell, O'Leary and Raftery demonstrated that a Bronze Age halberd and a typically Irish looped spearhead in reality may be assigned, on the basis of the palaeobotanical evidence, to periods that do not correspond to those suggested by the typology of the objects themselves.

Professor Seán P. O'Ríordáin of University college, Cork, continued his excavations at Lough Gur in County Limerick during 1941. In a small house site enclosed partly by low upright stones, and partly by natural rock, fragments of pottery in association with stone implements were found. This evidence, strongly suggesting a neolithic occupation in the Lough Gur region, is in accord with the implications of Professor O'Ríordáin's previous discovery of quantities of Windmill Hill (neolithic) pottery at the site.

Northern Europe.—Carl-Axel Moberg's *Zonengliederungen der vorchristlichen Eisenzeit in Nordeuropa* (Lund, 1941) is a comprehensive treatise on the fifth and sixth periods of the Northern Bronze Age, the three periods of the Pre-Christian Iron Age, and the earlier part of the so-called Roman Iron Age in northern Europe. This work was welcomed by a wide circle of old world archaeologists. It is an excellent reference book in which the author attempted to define the relationships of the several cultures involved on the basis of geographical and climatic factors.

Sweden.—An important series of pagan monuments found on the island of Gotland and dating from the 5th to the 11th centuries was described by Dr. Sune Lindqvist in his book, *Gotlands Bildsteine*. These monuments are sculptured with figures of horsemen, warriors, ships, etc. The book adds a great deal to existing knowledge of the culture of Gotland during dark age times when this island was an important trading centre connecting the east, via the Russian rivers, with the Baltic and Atlantic sea routes.

U.S.S.R. (Uzbekistan).—From the A.D. 9th to the 15th centuries Uzbekistan (Russian Turkestan) was the centre of an extensive state. In fact during the Samanid period its control extended to northern Afghanistan, Khurasan and other parts of Persia. In the two most important cities—Samarkand and Bukhara—there were many important architectural monuments, which were falling into a bad state of repair. It was gratifying to learn, therefore, that the soviet government established a Committee for the Preservation and Study of Monuments of Material Culture. In 1941, 80 of the most important Samanid buildings were being restored.

With regard to prehistoric times the potentialities of Uzbekistan cannot be overemphasized. Huge *tells*, such as Afrasiyab—the site of ancient Samarkand—were identified. By the close of 1941 there had been very few controlled excavations on this or any of the other ruined cities in the region.

A series of burial mounds between the Chirchik and Boz-Su rivers, near Kaunchi-Tepe, was being excavated by the newly formed Uzbekistan Committee for the Preservation and Study of Monuments and Material Culture. These barrows contained thousands of burials representing three periods: (a) typical Late Bronze Age tumuli similar to those of central Europe and the Ukraine, (b) a group of Iron Age burials of about 500 B.C., and (c) catacomb graves containing elaborate funerary furniture and attributed to A.D. 3rd and 4th centuries.

Iran.—Erich Schmidt's book, *Flights over Ancient Cities of Iran* (Sp. Pub. Oriental Inst. Uni. Chicago), is not only an outstanding contribution to Iranian archaeology, but also a brilliant demonstration of the infinite possibilities which aerial photography offers the archaeologist; for (a) explorations and general survey work can be accomplished quickly and effi-

ciently, (b) it is possible to document prehistoric sites in their topographical environment, and (c) the vertical air view provides the excavator with a base-map—a complete record of surface clues often invisible from the ground. Indeed, the air-map is actually superior in many respects to the ground survey, which requires several months to complete and considerable expenditures. The publication of *Flights over Ancient Cities of Iran* may be considered the archaeological "event of the year" as far as the old world is concerned. In addition to being the most elaborate and comprehensive work that has ever appeared in the field of aerial archaeology, this book points the direction along which research will be conducted in the future.

Information was in 1941 available regarding the 1937 excavations by the American Institute of Iranian Art and Archaeology at Kuh-i-Dasht in southern Luristan. In a circular stone sanctuary a considerable number of small bronzes, revealing a superlative skill, were brought to light. These votive figures chiefly represent goats, frogs and a miniature unicorn—all in the round—as well as an interesting series of repoussé disks. Several of the latter, known from other sites in Iran and the Caucasus, display Assyrian affinities. It was established that they were used as cult standards rather than as hairpins. For the most part the Kuh-i-Dasht bronzes may be dated to the end of the 2nd millennium B.C. (*c.* 1200 B.C.).

China.—Sites containing Late Neolithic black pottery, hitherto known only from Shantung, Honan and Anhwei in eastern China, were reported by Sterling S. Beath from the vicinity of Hangchow in Chekiang province, south of the Yangtze valley. This ware is for the most part wheel-made and burnished on the wheel when nearly dry. Its eggshell thinness indicates a highly developed ceramic technique.

Philippines.—Rev. J. F. Ewing, S.J., was in the Philippines in 1941, where he secured a large anthropometric series from the island of Mindanao. He also announced that he had discovered rich mesolithic as well as neolithic sites in this area. Although Father Ewing did no actual digging, nor was he likely to during the war, it was very significant that stone implements and pottery, of the same types as those found by Dr. Beyer in the vicinity of Manila, also occur on Mindanao.

Archery. The 61st annual tournament of the National Archery association, which was held at Portland, Ore., Aug. 5–9, 1941, was noteworthy because in every target event the record was either broken or tied. Larry Hughes of Burbank, Calif., won the men's championship and set up records of 141–827 in the Single York and 90–744 in the Single American. Miss Ree Dillinger of Bloomfield, N.J., won the ladies' championship by the narrow margin of one point over Miss Mildred Miller of Milwaukee, Wis., the final standing being Miss Dillinger 2,098, Miss Miller 2,097. Miss Dillinger made a new record of 72–584 in the Single Columbia and Miss Miller made a new record of 72–522 in the Single National. Dorothy Axtelle of Tacoma, Wash., won the girls' championship and established a new record of 144–1,022 in the Double Columbia. Billy West of Joplin, Mo., won the boys' championship and hung up a new record of 180–1,426 in the Double Junior American.

The 12th Annual Intercollegiate contest sponsored by the National Archery association was held in May with 148 teams (8 archers to a team) representing 95 colleges competing. In the women's division, first place was taken by Team I from the University of Connecticut, Storrs, Conn., and in the men's division, first place was taken by the team representing Los Angeles City college, Los Angeles, Calif.

In May 1941 the National Archery association also sponsored an interscholastic contest between teams (6 archers to a team) representing high schools. First place in the girls' division went to Bloomfield high school, Bloomfield, N.J., and first place in the boys' division to Forest Grove Union high school, Forest Grove, Ore.

The National Field Archers association inaugurated and successfully carried out a series of field archery contests by mail.

An outstanding performance of the 1941 archery season was that of Larry Hughes, the national champion, in making a Single York round score of 142–910 in a competitive event. (L. C. S.)

Architects, American Institute of: *see* AMERICAN INSTITUTE OF ARCHITECTS.

Architecture. The war was too dominant a factor in the daily and national life of 1941 to allow architecture to continue along its normal progress as an "art of building." The buildings in which individuals were free to choose their form of expression and carry out their experimentations could no longer be built. The international exchange of thought which had stimulated architectural progress had ceased. No new theories as important as those of Frank Lloyd Wright, Le Corbusier or Walter Gropius were expressed.

The architecture of the war period became a science of building, which dealt with the problems of supplying as expeditiously as possible the buildings needed for the expansion of the armed forces, of the industries producing war material, and of the housing and incidental building required for the security of nations. The war imposed limitations; shortages in materials were felt, air-raid precautions had to be considered, governmental control was increased, and construction had to proceed with unusual speed. The combination of these factors with the increasing complexity of architecture led toward greater co-operation between specialists. Large-scale planning was undertaken, not only in dealing with the emergency, but also in preparation for the postwar period.

Design and Planning.—The design of buildings for abnormal war-time needs demanded, aside from rapidity of construction, unusual economy and efficiency.

In industrial architecture the one-story factory established itself as the prevalent type due to the manufacturers' desire for large, clear areas unobstructed by columns, stairs or elevators. Such buildings allowed for the proper "flow" in production and easily facilitated changes which came as a result of research, the making of new products or the installation of higher speed machinery. Progress in fluorescent lighting and air conditioning made the design of windowless factory buildings practicable. Under the consideration of blackouts, night shifts and the effects from solar radiation through glass areas, this type had many advantages to offset its increased initial expense.

In the design of housing for the workers (*see* HOUSING) the requirement of low cost was mandatory with the insistence that the rent to the occupant be kept within a reasonable percentage of his earnings (not more than one-fifth). In American defense housing, the cost per family unit was substantially below that of similar units built during the war of 1914–18. Savings were achieved without loss of comfort by cheaper and more efficient construction, the elimination of all unessential features, a paring down of the spaces to minimums established for decent living, and the omission of wasteful attics, cellars or rooms for dining. Labour costs were reduced by the use of mass production methods, standardization and prefabrication. To provide the dwellings in as short a time as possible and to avoid "ghost towns" after the war, the government established three classifications of defense housing: permanent, demountable and portable.

In general, a greater concern over the problems of town and regional planning was shown. In Great Britain, this found expression in the formulation of policies for postwar reconstruction. In America, building programs were prepared as a "work reserve" for the period of demobilization. In both places, further need for a central planning authority was indicated.

Materials and Methods.—The shortage of building materials was particularly felt in the metals, where the difficulty of obtaining steel had far-reaching consequences. Aluminum was completely unavailable for building purposes and difficulties were encountered in the procurement of tin, brass, copper and the alloys. To deal with these shortages, governmental regulations allowed building only wherever necessary for defense or essential to the health and safety of the people. In Great Britain, special authori-

zation was required for building operations costing more than £100. The Department of Scientific and Industrial Research, London, issued bulletins dealing with wartime construction methods as affected by fire risks, the vulnerability of glazing under aerial bombardment, the provision of adequate lighting in working spaces combined with methods for blackouts, and the shortages of materials; in all recommended procedures, an attempt was made to maintain comfort at the normal level.

In the United States, a general priorities plan was worked out by the Office of Production Management of the national government to provide materials for essential construction. To accomplish this, a priority rating was required for the purchase of critical building materials. No private residential building was considered acceptable for priority if costing more than $6,000 per family unit or demanding rent of more than $50 per month. The feature of demountability, which was adopted for houses and schools in communities to be dismantled after the emergency, gave prefabrication a long-awaited opportunity. The shortage in steel increased the structural use of wood in America, and caused its revival as a building material for the construction of industrial buildings. Larger spans of lighter sections worked into trusses or lamella (lattice-type) roofs became characteristic of modern wood construction in opposition to the heavier beams and short spans of the older mill-type construction.

Among the materials which were outstanding in the progress of their development were glass and plywood. Both played an important role in that phase of progress in architectural design which grew out of technological changes. The use of glass blocks increased. Sheets of glass rendered unbreakable by heat treatment found popular appeal, particularly in store entrances where they permitted the elimination of supporting and enframing members and thereby gave increased vision.

With the development of two-directional bending of plywood for aeroplane construction came suggestions for the application of the new opportunities thus gained, in architecture and interior design. A chair was developed by Saarinen and Eames, which was moulded out of plywood to fit the human form. The 40-year-old method of plywood production in the United States saw the perfection of lathes capable of unwinding a continuous veneer 16 ft. wide and $\frac{1}{8}$ in. thick and a mile in length from an average 6 ft. diameter "peeler" log. The discovery of new types of glues and of synthetic resin bonding agents further improved the quality of plywood and lowered its cost.

Plastics came into wider use for all types of building accessories, hardware and lighting fixtures.

A system of providing comfort by radiating heat at a lower temperature from labyrinths of pipes within the floors or ceilings of rooms gained further acceptance in the United States, where fluctuations of extremes of temperature had hitherto prevented the ready appeal of this method. In keeping with the need for low-cost housing, new types of heating apparatus, economical both as to the use of space and the initial as well as operation cost, were manufactured.

Examples of Recent Architecture.—In England, according to an official statement from the ministry of works and buildings, more than 200 firms of architects in private practice, employing upward of 650 technical assistants, were engaged in the construction of hospitals, hostels, camps, stores, etc. In addition, panels which contained the names of more than 350 firms of architects were drawn upon for the development of air-raid shelter schemes and government buildings, to report on air-raid damage and advise on the precautions to be taken for the safeguarding of historic buildings. The design of shelters for protection from air raids was approached from a scientific basis, taking into account the destructive effect of bombs, standards necessary for the preservation of morale, the cost, and the distribution of shelters with regard to accessibility. Bomb-proof shelters were advocated by Tecton, architects, in the forms of cylinders built downward into the earth with several stories arranged in spiral fashion. (*See* also AIR RAID SHELTERS.)

In the United States, construction contracts for 1941 indicated the largest volume of building for any year since 1929. The types of buildings which constituted this volume were primarily in the fields of military construction, industrial building and housing for defense workers. Buildings which in normal times occupied the majority of architects had declined in volume.

A few examples of civilian architecture, unaffected by the war, were completed. Kleinhans Music hall, Buffalo, N.Y., F. J. and W. A. Kidd, architects, Eliel Saarinen, associate, echoed that type of design in which interest in form and the texture of material were supplemented by a decorative treatment of the surfaces. In the arrangement of the architectural masses the curved shapes of two music halls (dedicated to chamber music and orchestral performances) were brought into interesting interplay. The walls, both inside and out, were enriched by geometric patterns obtained through the jointing of the stone and plywood used for the panelled walls. In the design for the Washington airport building, Howard L. Cheney, consulting architect, the symmetry about the central axis and the classic proportion of the principal motives of the façades, showed in a dominant central portion the continuing popularity of traditional architecture. In contrast, the hangars of this airport, with their undecorated functional use of curved steel trusses, expressed modern functionalism which in part was also discernible in the broad ribbons of glass of the wings of the airport building. The Crow Island school at Winnetka, Ill., Eliel and Eero Saarinen, designers, was built of glass and brick in a modern design; the unusual plan produced in addition to a maximum of natural light for the classrooms and lobby an unusually cheerful atmosphere. In this building, it was shown that recent modern architecture had departed from the boxlike starkness by which it was characterized when it first appeared in Europe.

Regional characteristics of modern residential architecture found their expression on the west coast in the work of the architects of Los Angeles and San Francisco, on the east coast by the architects of New York, Boston, Philadelphia and Washington, and in the midwest, in Chicago. Among these, the work of Edward D. Stone of New York showed a use of glass which allowed for an uninterrupted visual combination of the outdoors with the inner spaces. It also demonstrated that modern architecture could express in designs the characteristics of the individuals for whom they were intended, instead of being impersonal statements of the dogmas of a style.

Many factories were built of unprecedented size with unusual rapidity. Opinions were divided on the use of natural lighting. The Ford factory at Dearborn, Mich., Giffels & Vallet, Inc. and L. Rossetti, architects, was an example of windowless construction. Speed of construction was demonstrated in the building of a 380,000 sq.ft. propeller plant for the Curtiss-Wright corporation at Caldwell, N.J., Albert Kahn, Inc., architects, which was ready for operation within 68 working days from the beginning of excavation.

The housing project at Indian Head, Md. was devoted to experimentation with and demonstration of prefabrication for residential buildings. Although most houses kept the traditional appearance typified by sloping roofs and the application of some ornamental features to satisfy popular demand, they varied substantially in their systems of construction. At Grand Prairie, Tex. it was demonstrated that an entire building could be erected and completed on the site within one day. Houses of cylindrical and

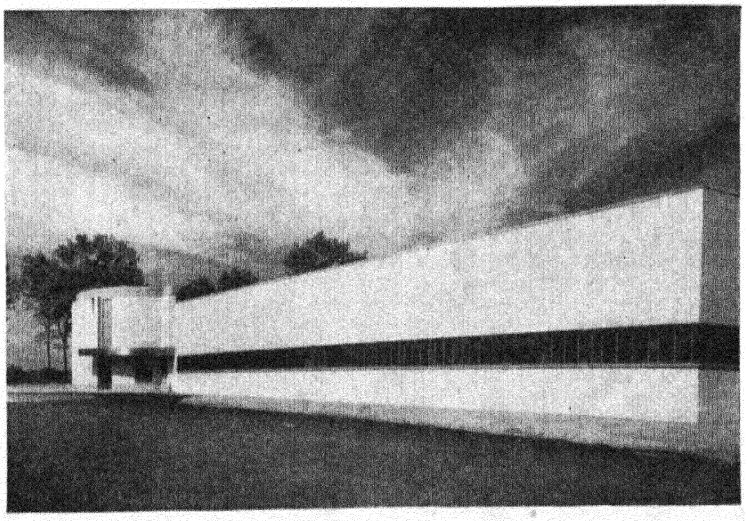
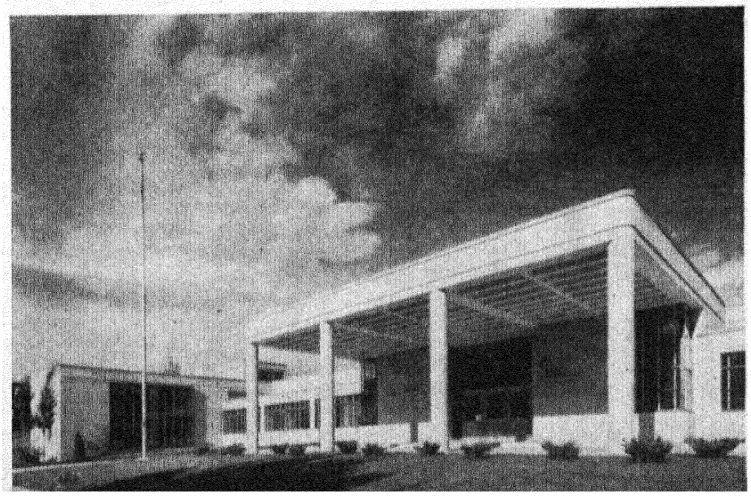
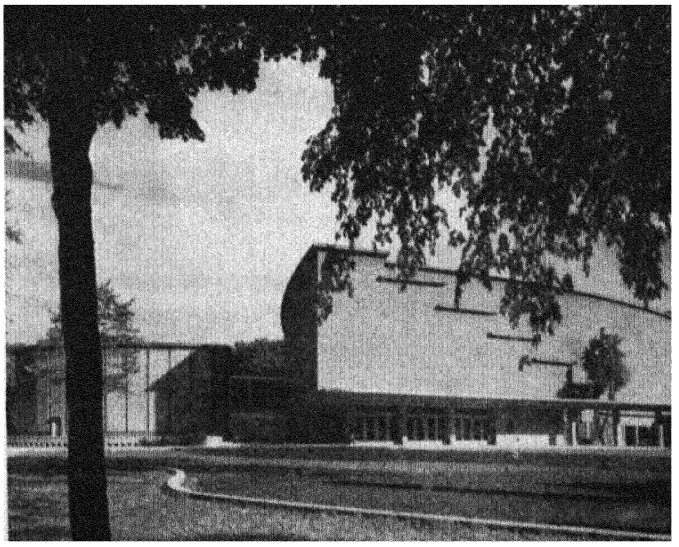
Below, right: KLEINHANS MUSIC HALL, Buffalo, N.Y.; F. J. and W. A. Kidd, architects, and Eliel Saarinen, associate







domed forms were proposed as answers to the problems of low-cost housing and prefabrication. Buckminster Fuller demonstrated the conversion of a mass produced steel grain bin into a demountable house. A number of dome-shaped residences designed by Wallace A., Neff, architect, were built at Falls Church, Va., by spraying concrete (Gunite) over inflated balloons. Thirty thousand dwelling units, out of an estimated demand of 300,000 for workers in defense industries, were designed by independent practising architects under the direction of the division of defense housing of the Federal Works authority. The size of the projects ranged from 20 to 1,690 family units. Row houses and single family buildings, with flat or sloping roofs, were typical of these. At Vallejo, Calif. the largest project, William Wurster, architect, interesting methods of mass production and assembly were applied. Also other government agencies, such as the Federal Security administration and the Public Building administration, were greatly active in this field. (*See* BUILDING AND BUILDING INDUSTRY.)

Archives, National.

This institution, created by act of congress in 1934 and administered by the archivist of the United States, has as its primary purposes the concentration and preservation in the National Archives building of such noncurrent records of the government of the United States as have permanent value and their administration so as to facilitate their use for governmental or research purposes.

Because of its services during the emergency of 1941, the National Archives was designated in Oct. 1941 as one of the national defense agencies of the government. More than half of the 81,000 cu.ft. of records transferred to the National Archives during the fiscal year 1941 came from the war and navy departments and other defense agencies, and the total of 330,000 cu.ft. of material in its custody included many records of World War I that were especially useful to defense agencies seeking information concerning that war. Chiefly as a result of this use, the number of requests for services on records received during the year exceeded in number those received during the two preceding years combined.

The Franklin D. Roosevelt library at Hyde Park, N.Y., which is also administered by the archivist, was dedicated on June 30, 1941. The museum portions of the building, opened to the public on that day, were visited by nearly 30,000 persons by Sept. 30.

Solon J. Buck took office as archivist of the United States on Sept. 18, 1941, succeeding Dr. R. D. W. Connor, the first archivist, who resigned to accept a newly endowed professorship at the University of North Carolina. (S. J. BU.)

Argentina. A republic on the Atlantic coast of southern South America and second largest country of the continent; language Spanish; Capital, Buenos Aires; President, Dr. Roberto M. Ortiz (acting president, Dr. Ramón Castillo). The area is 1,079,965 sq.mi., slightly over a third of that of the United States. The religion is Roman Catholic.

No official census has been taken since 1914, but official estimates placed the population at 13,318,320 as of Dec. 31, 1940. No other American country except Canada has as large a proportion of whites. Native-born persons of European stock aggregated 76·9%, mixed bloods 3·2% and foreign-born (almost entirely European) 19·9%. A majority of the population is of pure Spanish stock, nearly a third is Italian or part-Italian, and an estimated 250,000 are German or part-German. Buenos Aires had a population of 2,515,729 (1941 municipal census), or 3,700,000 with its suburbs. Other cities (with est. pop.) include: Rosario (513,000); Avellaneda (suburb of Buenos Aires) (386,000); La Plata (248,000); Córdoba (213,000); Santa Fé (147,000); Tucumán (147,000); Bahía Blanca (115,000); Mendoza (82,000); Paraná (72,000). In 1916–41, cities and villages of 1,000 or more inhabitants increased their total population by 108% and aggregated 75% of the whole in 1941, while the rural population remained stationary. Around 45% of the population lives in Buenos Aires province and in the Federal District (the city of Buenos Aires).

Government is federal in form, with legislative power vested in a bicameral congress. There are 14 provinces, a federal district and 10 territories. The constitution is modelled broadly on that of the United States. The provinces, however, have in general less autonomy than do the individual North American states.

History.—Argentine history in 1941 was marked by sharp internal political conflict, by serious international frictions, notably in regard to nazi propaganda activities, and in general by a closer relationship with the rest of the Americas. In short, Argentine development during the year followed the general course of world events, which vitally affected it, but policies and procedure were conditioned by domestic political considerations.

Domestic politics played an important role. With a Conservative acting-president and a chamber of deputies controlled by the opposition Radical (*i.e.*, Liberal) party, the year was marked by almost constant political strife. Tension increased as the year wore on, and lessened only with the adjournment of congress in October.

Much of the political confusion arose from the continued illness of President Ortiz, who, prior to withdrawing in favour of Vice-President Ramón Castillo in July 1940, had enforced a policy of fair elections. Under Ortiz, the Radical party, after wandering in a political wilderness since 1930, had gained control of the lower house of congress and several provincial governments. Neutral observers conceded that the Radical party had the confidence of the country, and for this reason the party demanded annulment of fraudulent provincial elections in Mendoza (Dec. 15, 1940) and Santa Fé (Jan. 5, 1941). The Radical party adopted an obstructive policy in congress and refused to pass essential legislation, hoping thus to force free-election pledges from Acting-Pres. Castillo. By May only a handful of bills had been acted upon, no budget for the year had been approved, and no ratification made of the $100,000,000 U.S. Export-Import bank loan to Argentina. When Castillo by executive decree extended the 1940 budget and declared his intention of governing by decree if necessary, the Radical deputies terminated their boycott (May 6). Meanwhile, in January, two outstanding cabinet members likewise resigned, reportedly in protest against Castillo's election policy—Foreign Minister Julio A. Roca (vice-president from 1932 to 1938) and Finance Minister Federico Pinedo.

Amid this heavily charged atmosphere came another serious problem—that of nazi and fascist propaganda and other activity in Argentina. Charges of totalitarian propaganda in the army and of subversive activities in other quarters were aired in congress in June. In response to a formal congressional demand, Interior Minister Culaciatti officially admitted intense nazi activities in many directions but denied their importance (June 18). The chamber of deputies thereupon named a committee, headed by Deputy Rául Damonte Taborda, to investigate "activities contrary to the institutions and sovereignty of the Argentine Republic." The Damonte committee, although denied administrative and police aid, made a sweeping investigation, and during late August and September presented a series of reports with startling disclosures. It formally charged that the nazi party, although formally dissolved by presidential decree of May 15, 1939, still existed with an organization on military lines throughout Argentina, with the German ambassador directing its activities. German embassy expenditures, it was shown, were 36 times as great (5,983,000 pesos) in the year ending June 30, 1941 as in 1938–39; 500,000 pesos in bearer checks had been issued in a single week, part to the nazi propaganda organ *El Pampero;* the German news agency *Transocean* was disclosed to be purely a subsidized propaganda vehicle. Evidence was given, too, of active axis agents among German schools in the Argentine, of German control of 2,000,000,000 pesos of Argentine business through nazi conquests in Europe, a regular system of assessment of Germans resident in the Argentine, and presence of at least 60,000 nazis in Buenos Aires alone. At the same time, there was revealed the existence of strategically located German groups, not only in Argentine areas such as Patagonia and Misiones territory (the northernmost finger of Argentina), but in other South American countries as well. (*See* BRAZIL; HISPANIC AMERICA AND WORLD WAR II.)

The chamber of deputies quickly passed, by a vote of 88 to 1, a resolution declaring German Ambassador Baron Edmund von Thermann *persona non grata* and demanding his expulsion. Von Thermann himself refused to withdraw, and in September, Acting-Pres. Castillo formally "dissociated" his administration from the congressional demand, an act recalling Pres. Irigoyen's flat disregard, in 1917, of a similar congressional resolution after disclosure of German anti-Argentine activity.

Indicative of the administration's unwillingness to antagonize the axis powers was its cautious, legalistic policy toward axis shipping in Argentine harbours. Refusing to follow the lead of the United States, in seizing axis and axis-controlled ships, the government entered into negotiations with Italy and—after long delay—purchased 16 Italian ships totalling 88,000 gross tons. These were made the nucleus of a state-owned merchant marine.

Meanwhile, Argentina had moved toward a hemisphere economy, taking steps in the direction of a qualified Pan Americanism, notably by ratification, in July, of the Havana conference pacts by unanimous vote of both houses of congress. As a result of the Río de la Plata regional conference in Jan. 1941, a treaty was signed with Brazil (Nov. 21) providing reciprocal progressive reduction of duties on non-competitive commodities, tariff exemption of new industrial products, and improvement of communications between the two countries. Other trade pacts were made with Bolivia and Cuba, and negotiations were started with Chile, Paraguay and Uruguay.

Most important of all trade agreements, however, because of its dual political and economic implication, was one with the United States, signed on Oct. 14 after long and protracted negotiations. Under this agreement, tariff duties on 84 items, which accounted for 93% of Argentina's 1938 and 1939 exports to the United States, were cut roughly 50%, while Argentina reduced her duties

on a variety of United States exports by 25% to 50%. The most important Argentine commodities affected were canned meat, wool, hides, linseed and casein. Although the status of Argentine fresh meat was unchanged—its importation into the United States having been banned since 1927 on grounds regarded by Argentina as not only flimsy but gratuitously insulting—the general effect of the agreement was to remove a major impediment to hemispheric solidarity. Meanwhile, a British contract was made for 500,000 tons of Argentine beef (the entire exportable surplus) in the year ending Oct. 1942. Similar large-scale cotton and grain contracts were made with Spain (*see* SPAIN).

Conflicting territorial claims in the Antarctic continued to be an issue with Chile; parleys on the subject, although amicable, were without concrete result. Spread of World War II to the Americas raised another question with Chile—revision of an 1881 treaty forbidding fortification of Magellan strait (*see* CHILE). Argentine claims to the Falkland islands were likewise aired during the year, but with much less fervour than in the past.

Late in September the political situation was suddenly obscured by sudden infantry occupation of military airports and grounding of all army planes in what was widely reported to be suppression of a nascent plot. This, and the president's sudden removal of the entire municipal council of Buenos Aires, accentuated the friction between Castillo and the Radicals. The Radicals refused to pass important financial measures until Pres. Castillo promised to permit free provincial elections in December. Castillo remained adamant, however, and congress adjourned with the breach still wide. The elections resulted in the expected Conservative victory. Public attention, however, was diverted by the outbreak of inter-hemisphere hostilities.

Japan's attack on the United States came as a hard shock to Argentina's complacent neutrality. Pres. Castillo promptly declared that the United States would not be treated as a belligerent, and on Dec. 16 put Argentina in a formal state of siege, with a suspension of constitutional guarantees. Newspapers were forbidden to print anything "affecting the neutrality of the Argentine nation" or against the government, political regime, head of state, or officials of any belligerent nation. Demonstrations, whether pro- or anti-axis, were forbidden, and permission for a mass meeting to pay homage to Pres. Roosevelt was refused. Press and public opinion, however, were so strongly and openly anti-axis that Pres. Castillo recalled the Argentine ambassador to Germany "for consultation," and, on Dec. 31, made a formal declaration of Argentine solidarity with the United States.

Education.—Education is free and compulsory. In 1940 there were 13,615 elementary schools, with 1,929,818 enrolment; 6,463 of these (enrolment: 927,580) were under complete federal control, the remainder under provincial, with federal support, however. An additional 1,167 private schools (as of 1939) had an enrolment of 139,917. Secondary schools of all types numbered 445, and had 75,903 pupils. Six national and one private universities had enrolments aggregating nearly 30,000.

Defense.—Military or naval service is compulsory. The standing army in 1941 was estimated at 45,000, with potential reserves of 281,000. Modern equipment was almost entirely lacking. The navy comprised 2 battleships, 3 cruisers, 16 destroyers and 3 submarines. Air strength was around 300 planes. A military mission was sent to the United States late in 1941 to make extensive purchases of needed materials. A five-year rearmament plan allotting 712,000,000 pesos for naval and 646,000,000 for military expansion was approved by congress in October. Lend-lease aid from the United States approximating $70,000,000 was reported to have been made.

Finance.—The monetary unit, the peso, had an official exchange value of 26.8 cents U.S. and an unofficial rate of approximately 23¾ cents U.S. in 1941. Budget estimates for 1942 called for an expenditure of 1,600,000,000 pesos (a 46,246,000 peso increase). A 1941 deficit well in excess of early estimates of 150,000,000 pesos was expected. Government revenues are largely from customs duties. Income tax rates reach a maximum of 7% at 250,000 pesos.

The public debt on June 30, 1940 totalled 7,724,535,000 pesos (national, 5,291,382,000 pesos; provincial, 1,584,408,000; municipal, 848,745,000), of which 1,952,998,000 pesos, including $190,500,000 in U.S. dollar bonds, were internal. Argentine credit was the highest of any Hispanic American republic in 1941. In Nov. 1941, approximately 2,500,000,000 pesos of 5% internal bonds were converted at 4%.

Foreign Trade.—Argentine imports in 1940 totalled 1,498,757,000 pesos, a 12% gain over 1939; exports were 1,427,933,000 pesos, a 9.2% decline. The United States supplied 29.1% of all imports (1939: 17.2%), Great Britain 19.8% (19.9%), Brazil 7.8% (6.5%), Curaçao 4.9% (4.0%), British India 4.3% (3.9%), Peru 3.9% (4.0%), France 3.1% (5.6%), Belgium 2.8% (6.5%), British Asia (except India) 2.4% (2.2%), Canada 2.3% (1.2%). Great Britain took 36.4% of all exports (1939: 35.9%), United States 17.5% (12%), France 5.8% (4.9%), Brazil 5.3% (4.3%), Spain 3.9% (1.9%), Netherlands 3.7% (8.1%), Italy 3.4% (2.1%), Belgium 2.5% (7.1%), Uruguay 1.7% (1%), Japan 1.5% (0.7%), Sweden 1.4% (2.1%).

The principal imports in 1940 were: fuels and lubricants, 17.5%; textiles, 17.4%; machinery and vehicles, 9.9%; iron and iron goods, 9.2%; chemicals, pharmaceuticals, etc., 8.5%; foodstuffs, 7.2%; metal goods (except iron), 6%; paper goods, 5.8%. Proportions varied only slightly from those of 1939. The principal exports were, by value: wheat 19.9% (1939: 17.5%), chilled and frozen beef 13.1% (13.2%); unwashed wool 8.4% (7.6%), linseed 8.4% (10.8%), hides 7.1% (6.3%), maize 6% (12.9%), washed wool 8.4% (2%), canned meats 3.1% (3.2%), chilled and frozen mutton 2.9% (2.2%), quebracho extract 2.1% (2.7%). While export totals were the lowest, with one exception, in ten years, eight of the ten leading commodities increased in average unit price. The tonnage of cereal exports in 1940 was: wheat, 3,646,603 (1939: 4,745,944), maize 1,874,463 (3,196,073), linseed 752,191 (1,183,203), oats 223,382 (359,791), barley 388,867 (194,851), rye 166,414 (194,851), birdseed 9,255 (6,877). Meat exports totalled 562,658 tons (1939: 669,300 tons), hides 131,450 tons (147,556 tons), sheepskins 11,815 tons (15,518 tons), washed wool 25,146 tons (17,471 tons), unwashed wool 99,027 tons (122,691 tons). Quebracho extract exports were 121,375 tons (1939: 195,863 tons), logs 21,853 tons (74,948 tons). Fresh fruit exports declined from 52,700 tons in 1939 to 24,500 in 1940.

In the first nine months of 1941, imports declined 25.6%, with the United States supplying 27.8% of the total, Great Britain 18.7%, Brazil 12.8%, Peru 5.8%, India 5%, Curaçao 4.8%, Japan 3.6%, Canada 3.3%. Exports were 7.1% less in value, 40.9% less in volume. The United States took 36% of total values (14% in the same period of 1940), Great Britain 32.7%, Brazil 5.8%, Spain 4.6%, Japan 3.5%, Uruguay 1.9%, Chile 1.8%, Bolivia 1.5%, Switzerland 1.2%, Paraguay 1%. The decline in volume was due almost entirely to reduced grain and linseed exports, above all of maize, which was one-fifth the 1940 total. Wool tonnage rose 52%, hides 22%, meat 4.7%, dairy products 80.8%. Most of the declines were registered early in the year; by August, however, the downward trend had been reversed, and export values for the first 10 months were off only 3.5%, export volume about 37½%, while imports were up to 75% of 1940 values.

Communication.—The greater part of Argentine external commerce is handled through Buenos Aires, which is served by numerous steamship lines and is the hub of the country's railway system. Rosario, on the Paraná, however, handles more wheat and maize tonnage than does Buenos Aires. Bahía Blanca, to the south, is also an important cattle and grain port. Comodoro Rivadavia, in southern Patagonia, is the centre of the petroleum industry.

Argentina has the most extensive railway system in Latin America. The country is linked by rail with Bolivia, Paraguay and Uruguay, and by rail and bus with Chile (through the Transandine railway route and Bariloche in the south). In 1941, 42,112 km. of railways (12,702 km. state-owned) were in operation. Government policy is to extend the state railway system. The Transandine railway, purchased in 1940, was under reconstruction, and unsuccessful negotiations were carried on for acquisition of the six British-owned lines, operating 59% of all mileage and representing an investment of around $627,000,000. An Argentine government-financed rail line into the Bolivian oil-fields was in process of construction by agreement with Bolivia in 1941. During 1941 work was accelerated on the Salta-Antofagasta railway, in construction since 1921. A 6,500,000-peso annual expenditure until 1946 was expected to carry the line to the Chilean frontier at Socompa.

Air transport by Pan American airways provides extensive service to all parts of America, with almost daily connections to Chile and Brazil. The Italian "LATI" line began service from Europe (via Brazil) on July 30, but a gasoline boycott compelled cessation in December. State-operated air routes aggregated some 10,000 km. in 1941, and plans for further extension, including lines to Bolivia and Paraguay, Uruguay, and Brazil, were announced Sept. 19. A private aviation training school was opened near Buenos Aires early in 1941. There were 22 glider clubs, with 32 gliders and 1,000 members in 1941.

The Argentine merchant marine aggregated some 300,000 gross tons in 1941, most of it state-owned. Under war conditions, strenuous efforts at further expansion were made.

In 1941 there were 308,248 km. of roads of all types, with 55,403 km. additional under construction. Approximately 65,000 km. were national, although the federal government contributes toward provincial highway development as well. Maintenance is chiefly through a gasoline tax, with annual expenditures around 100,000,000 pesos (101,715,000 in 1941). Although highway mileage was greatly expanded after 1930, the number of automobiles declined from 435,822 to 423,942 in 1939, because of import restrictions, with an increased age of cars in actual service from 7.5 to 11.9 years.

Agriculture.—Argentina's resources are principally agricultural and pastoral, with 10.8% (74,130,000 ac.) and 44.4% (306,404,000 ac.), respectively, of the country's area devoted to them in 1941. Together they account for well over 90% of all export values.

The chief agricultural products are cereals and linseed. In 1941–42 the area devoted to principal crops (in hectares; 1 hect. = 2.471 ac.) was: wheat, 7,190,000; maize (1940–41), 6,097,600; linseed, 2,733,000; oats, 1,440,000; barley, 702,000; rye, 947,000; birdseed, 54,000; rice (1940–41), 30,500; sugar cane (1939–40), 188,714; vineyards (1939–40), 137,934; cotton (1940–41), 336,600; sunflower seed (1940–41), 530,000; alfalfa (1939–40), 5,402,400; potatoes (1940–41), 241,800. Total cereal and linseed acreage was 4.4% less than in 1940, despite an increase in wheat. Tonnage produced was: wheat 7,380,200; linseed 1,459,600; maize 10,450,000; oats 539,500; barley 789,000; rye 212,200; sugar cane 5,835,075 (1939–40); cotton 154,794; sunflower seed, 370,000; rice 57,000 (11,089 tons imported in 1940); potatoes 1,053,000; grapes 953,866 (1939–40). In 1940, 1,455,725 tons of wheat, 539,443 of sugar and 6,706,804 of grapes were processed, nearly all for domestic consumption.

Official estimates as of June 30, 1938 showed a total of 45,916,768 sheep, 34,317,663 cattle, 8,262,057 horses, 4,760,755 goats, 3,381,439 swine and 791,199 asses and mules in Argentina. During 1940, 6,983,694 cattle, 7,518,169 sheep and 1,176,469 hogs were slaughtered, of which 2,120,877 cattle, 4,582,452 sheep and 169,186 hogs were for export. Official 1940 production estimates were: 7,800,000 cowhides, 11,100,000 sheepskins, 176,000 tons of wool.

The dairy industry was increasing in importance in 1941. Production in 1939 was 34,248 tons of butter, 51,065 tons of cheese and 20,781 tons of casein.

Some 9,208 tons of eggs were exported. The small fishing industry was being expanded in 1941.

Forestry.—Timber is limited except in the subtropical north, where quebracho, source of tannin, and yerba mate (Paraguay tea) are well developed, the latter for domestic consumption as well as export. Argentina normally produces most of the world supply of both.

Manufacturing.—Manufacturing underwent extensive development after 1935.

Comparative figures from the 1939 and 1935 industrial censuses showed a 32.7% increase in the number of establishments (to 53,866) and 30.4% in number of employees (to 618,606). Subsequently, a probably much greater increase took place. The chief production is in foodstuffs, textiles, forestal products, paper, printing and chemicals and pharmaceuticals. Practically all manufacturing is for domestic consumption.

Mineral Production.—Argentina ranked 11th in the world production of petroleum in 1941. In 1940 petroleum production, 3,276,496 metric tons, was 10.7% greater than in 1939.

Approximately 60% came from state-owned wells. The first nine months of 1941 showed a further increase of 10.67%. Some 75% came from the Comodoro Rivadavia fields in Chubut territory (in southern Patagonia), the rest from Neuquén territory and Salta and Mendoza provinces, along the Andean foothills.

During 1940 mining advanced considerably, as axis buyers acquired control of some 50% of the tungsten and mica output, the only metals produced regularly. Some beryllium, lead concentrates, tartarate of lime and borax are exported irregularly. In 1941 Japanese control of the tungsten supply was thwarted by a United States purchase agreement with the Argentine government. (L. W. Be.)

Arizona.

The "Apache state" lies in the southwestern part of the United States of America. It borders Mexico on the south; the Colorado river forms most of the western boundary.

Arizona and New Mexico are the youngest of the United States, both being admitted in 1912. By federal census of 1940, the area is 113,580 sq.mi.; pop. 499,261, 65.2% rural and 34.8% urban. Native and foreign-born whites (including Mexicans) numbered 389,955 and 36,837 respectively; Negroes, 14,993; other races (mostly Indians), 57,476.

The capital is Phoenix with a population of 65,414. Chief cities are: Tucson (36,818); Douglas (8,623); Mesa (7,224); Globe (6,141); Prescott (6,018); Bisbee (5,853); Yuma (5,325) and Flagstaff (5,080).

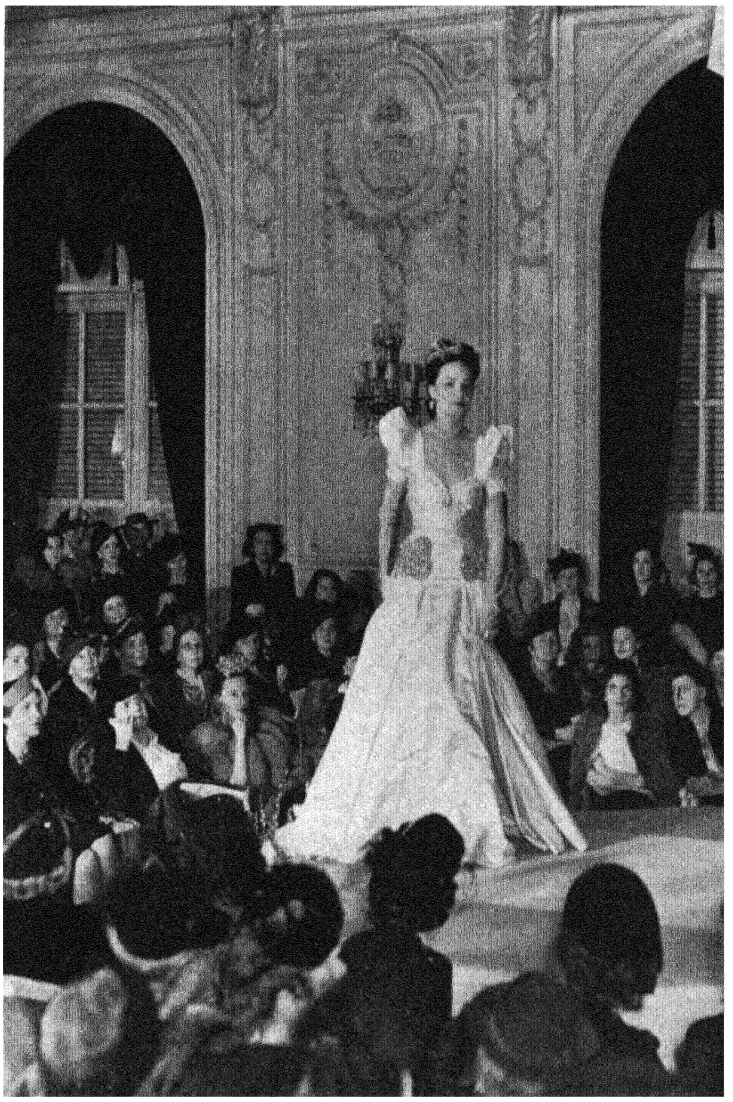
History.—The state officials in 1941 were: chief justice, Alfred C. Lockwood; governor, Sidney P. Osborn; secretary of state, Harry P. Moore; attorney-general, Joe Conway; treasurer, Joe Hunt. Governor Osborn in 1941 proposed the consolidation of bureaus and offices, a new board of control for the state hospital, and an increase of old-age pensions from $30 to $40 per month. The last two measures were formulated into law.

Education.—According to the report of 1939–40 the enrolment and teaching force of the various branches stood, respectively, as follows: elementary schools 87,960 and 2,670; high schools 22,245 and 934; University of Arizona at Tucson 2,906 and 275; State Teachers college at Tempe 1,505 and 72; State Teachers college at Flagstaff 545 and 41. In addition, there were 32 private, parochial and federal Indian schools with a total enrolment of 7,208.

Public Welfare, Charities, Correction.—In Nov. 1941 there were 38,872 persons receiving assistance from the state department of social security and welfare, with a total state expenditure for the month of $330,911. In Nov. 1940 there were 38,664 persons receiving $443,170. State appropriations for 1941 were as follows: industrial school $57,370; juvenile girl offenders $50,000; pioneer home $75,630; prison $181,540; state hospital for insane $298,675; school for deaf and blind $83,870.

Leading Agricultural Products of Arizona, 1941 and 1940

Crop	1941 (est.)	1940
Wheat, bu.	465,000	819,000
Oats, bu.	377,000	297,000
Sorghum grain, bu.	1,508,000	880,000
Corn, bu.	406,000	362,000
Cotton lint, bales	203,000	195,000
Grapefruit, boxes	3,000,000	2,050,000
Oranges, boxes	600,000	500,000
Horses, head	70,000	70,000
Cattle, head	840,000	864,000
Sheep and lambs, head	793,000	755,000



BRITISH MANIKINS modelled the latest creations of London dressmakers at Buenos Aires and other South American capitals in May 1941 in a concerted drive to capture the Latin American style trade

Communication.—The total road mileage in 1941 was 28,291; 3,453 mi. were improved and 3,644 were under the state system. Total railroad mileage, Dec. 31, 1939, was 2,234.

Banking and Finance.—National banks in 1941 had deposits of $70,202,000, loans of $34,911,000 and investments of $17,595,000. State banks had deposits of $30,451,000, loans of $11,124,000 and investments of $12,466,000.

Agriculture.—Citrus fruit, cotton, lettuce and beef cattle ordinarily comprise three-fourths of the value of farm products of Arizona.

Manufacturing.—Only 8.4% of the population were engaged in manufacturing in the state in 1941. The most important industries were food, textile, metal and lumber products.

Mineral Production.—Seven districts ordinarily contributed 99% of the output of copper for the state. The copper output for 1941 was estimated at 671,000,000 lb. The value of all mineral products for 1941 was estimated at $100,000,000. (H. A. H.)

Arkansas.

In the south-central U.S., Arkansas was the 25th state admitted to the union (1836). Its older popular name is "Bear state," the newer (by act of the legislature), "Wonder state." Area, 55,336 sq.mi.; pop. (1940) 1,949,387. The population is predominantly rural, although the 1940 census showed a slight movement to the cities, the urban population having increased from 20.6% in 1930 to 22.2% in 1940. The white population was 1,466,084; Negro, 482,578; other races, 725; foreign born, 7,692. Only 3,210 aliens registered in 1941 under the federal law. The capital is Little Rock (88,034). Other cities are Fort Smith (36,584); Hot Springs (21,370); Pine Bluff (21,290); North Little Rock (21,137); El Dorado (15,858); Texarkana (11,821).

History.—The following state officials, all Democrats, were inaugurated on Jan. 14, 1941, for a two-year term: Homer M. Ad-

kins, governor; Bob Bailey, lieutenant governor; C. G. Hall, secretary of state; Jack Holt, attorney-general; Otis Page, land commissioner; Earl Page, treasurer; J. Oscar Humphrey, auditor; J. S. Holt, associate justice of the supreme court. The outstanding act of legislation in 1941 was the refunding of the highway debt with the RFC at a lower rate of interest. To make assurance doubly sure, court proceedings and a referendum were held on the bill. Other acts of importance were: allowing cities of the first class to levy taxes to pay salaries and pensions of firemen and policemen; establishment of civil service in cities with a population of 20,000 and more; authorizing the governor to join interstate compacts for the conservation of oil and gas; forbidding political parties to name candidates except through primaries or conventions (this was a slap at the Democratic state central committee for naming a candidate for U.S. senator); exempting servants, farm labourers and others from the workmen's compensation law; reorganizing the board of trustees of the University of Arkansas and taking the governor and the secretary of the board of education off the board. According to the old plan of congressional apportionment, Arkansas would have lost one seat in the U.S. house of representatives and Michigan would have gained one. Congress, however, amended the law for "equal proportions" for representation instead of "major fractions," and Arkansas held its seven seats in 1941.

Arkansas had received, by the end of 1941, defense contracts amounting to $12,610,000, among them a munitions plant at Jacksonville and a $33,000,000 aluminum plant on Lake Catherine, near Hot Springs. A $20,000,000 power plant was contemplated, but in the meantime a tie-up with Grand river dam in Oklahoma was to supplement local power.

Education.—The enrolment in the public schools in 1941 was: grades one to eight, 398,246; grades nine to 12, 73,708, a total of 471,954; teachers numbered 13,173; expenditures were $14,023,914. At the state university in the fall semester, 1941, the enrolment was 2,443; teachers numbered 186. Enrolment in state teachers' colleges was 1,040; teachers, 82.

Public Welfare, Charities, Correction.—Appropriations for welfare in 1941 amounted to $7,000,000, plus $884,440 for administration; confederate pensions, $300,000; firemen's pensions, $300,000; teachers' retirement, $207,000; food and cotton stamps, $200,000; employment, $91,000. The penitentiary had 900 white inmates, 800 Negro (including 45 women); the state farm for women had 68. The legislature appropriated $528,800 for the penitentiary; $67,960 for the boys (white) industrial school; $50,390 for the girls' industrial school; $64,350 for the Negro boys industrial school.

Communication.—The state had 9,289.3 mi. of highways in 1941, of which 1,242.7 were concrete, 486.8 asphalt, 1,357.1 bituminous and 5,575.8 gravel. The appropriations for 1941–43 were: $19,650,000, including $3,000,000 county highway fund, $10,000,000 federal, and $6,650,000 state highway. The railway mileage was 4,538.

Banking and Finance.—State bank and trust companies numbered 167 in 1941; building and loan associations, 9. The resources of the former amounted (Sept. 24, 1941) to $121,062,240; deposits, $108,159,436. The national banks numbered 50 with $143,121,585 in assets and $128,831,694 in deposits (Dec. 31, 1940).

State revenue received in 1939–41 was $63,016,301.78. On Dec. 31, 1941 the debt was $146,850,223, a reduction of $4,611,629 from Nov. 1939.

Agriculture.—The total value of crops produced in Arkansas in 1940 was $169,000,000. The cotton crop in 1940 was valued at $69,712,000; corn, $24,884,000; rice, $6,919,000.

Table I.—*Leading Agricultural Products of Arkansas, 1940 and 1939*

Crop	1940	1939
Cotton, bales	1,540,000	1,351,209
Corn, bu.	42,903,000	33,762,323
Rice, bu.	9,741,000	2,185,242

Manufacturing.—In 1939, the industries of Arkansas turned out products valued at $160,166,984 and employed 39,438 persons to whom they paid wages of $30,787,479.

Table II.—*Principal Industries of Arkansas, 1939 and 1937*

Industry	Value of Products	
	1939	1937
Sawmills and kindred works	$35,222,273	$35,963,098
Cottonseed oil, etc.	17,340,538	14,383,526
Petroleum refining	14,327,824	21,320,560
Nonalcoholic beverages	5,632,283	878,381
Household and office furniture	5,441,196	6,627,435
Bread and bakery products	4,910,418	5,384,284
Newspaper publishing and printing	3,848,381	3,661,977

Mineral Production.—The total value of mineral production in Arkansas in 1940 was $33,705,929; in 1939 it was $28,563,693.

Table III.—*Principal Mineral Products of Arkansas, 1940 and 1939*

Mineral	Value, 1940	Value, 1939
Petroleum	$21,230,515	$16,931,240
Coal	4,480,713	4,103,020
Bauxite	2,804,144	2,293,455
Manganese	126,299	89,178
Natural gas	578,808	545,936
Natural gasoline	520,669	754,709

(D. Y. T.)

Armies of the World.

During the year 1941, 30 armies of the world engaged in warfare as World War II extended widening circles of conflict on land and sea and in the air. The preceding 16 months had seen some armies disappear following defeat in major engagements. Others were ineffective and offered no serious resistance to attack. Victorious armies continued the march of conquest and consolidated fresh gains in new territories. Large armies remained engaged in major conflicts. New armies entered the war within the closing weeks of the year.

In Russia, Germany and Finland opposed the enormous and partially tested strength of the Soviet Red army. In western Europe, North Africa, the near east, the far east and in China the armies of the dictatorships remained opposed to the forces of the democracies. In the western hemisphere, the United States, attacked by Japan, without declaration of war and in the midst of peaceful efforts, entered the war on Dec. 8, 1941. There had been widespread unprovoked attacks on U.S. outposts in the Pacific before the Japanese declaration of war. Japan also declared war against Great Britain while the British and the nations associated with them entered the war against the Japanese. In a world of conflict all armies of the world were affected in large or small degree. Each played a role, first in relation to national policy, and second, dependent upon international demands. A limited military analysis of the armies of the world without weighing these policies emphasizes principally the results of military action. For the most part, the armies examined here participated in campaigns during 1941. A brief examination is included of those armies preparing for but up to Jan. 1, 1942 not actively engaged in combat. Any contemporary analysis of the principal armies of the world is limited by the restrictions imposed by warfare censorship. All factual information is presented after careful selection from material secured from the best available sources.

Germany.—By Jan. 1, 1941 the German armies had overrun Denmark and Norway; repulsed British attempts to dislodge them; invaded and defeated Luxembourg, Holland and Belgium; outflanked the ill-famed Maginot defenses; eliminated effective British and French opposition on the continent; acquired an Italian ally; and closed 16 months of combat marked by a rising tide of nazi supremacy on modern battlefields. All German theory of the conduct of military combat has been based upon the immutable principles of war. Political circumstances, as well as the application of modern machinery, demanded changes in the modern application of this theory. The results of defeat in World War I, the restrictions of the Versailles treaty, the complete coordination of all political, social, industrial and military strength within a unified plan of grand strategy, the full exploitation of diplomatic geographical advantages, increased mobility gained by the development and application of the combustion engine, improved techniques in propaganda and the war of nerves, the relentless pursuit of perfection in details; these plus an inspired and cultivated national determination to re-establish the invincibility of German arms, combined to produce a national military machine unprecedented in power, secured by resounding success,

and prepared to extend the area of conquest during the year 1941.

Organization.—Never before in history had the principle of a "nation in arms" been so fully developed. The whole nation had been organized and blended as a unit for the sole purpose of aggressive war. The German armies were organized as a part of the large team combining all effective elements of national strength. A principal factor peculiar to the German organization was the co-ordination of high command in the realization of the single purpose: the prosecution of war. Tables I and II present a brief analysis of the national organization and the relation of the military forces to all other national efforts.

Table I

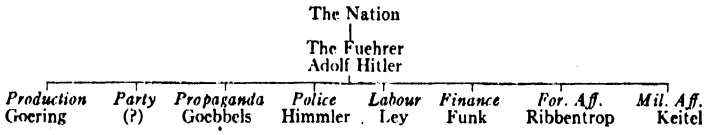


Table II

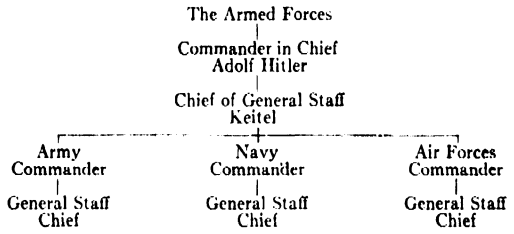

These tables illustrate the concentration of power and effort, and the simple channels of command, and suggest the relative ease with which unified control can be assured for any plan or project. No table can solve specific problems, and any solution must rest upon the co-ordination of many parts and the resolution of many intangibles. However, all planning within this channel of command appears to rest upon a single principle. That principle, in the popular language of the German press, has been stated as follows: "The right man is everywhere and always put in the right place."

The method of arriving at a solution to a specific problem appeared to be as follows: The national and international aspects of the political, economic and social elements of the problem are examined and a decision announced by the national organization outlined in Table I. This decision is presented to the chief of the general staff as a mission by the commander-in-chief of the armed forces. The chief of the general staff then translates this mission into a directive which, when approved by the commander-in-chief, is discussed at a meeting of the commanders of the three armed services, army, navy and air forces. Above all other consideration, the primary decision reached by this group is the selection of a single commander to whom full responsibility as well as all available resources are given to accomplish the particular task. This commander may be a member of any one of the three armed services. His selection is made principally dependent upon the nature of the mission to be performed and because he is considered to be the individual most likely to succeed. Once chosen, this commander becomes directly responsible to the chief of staff of the armed forces and to the commander-in-chief for the successful accomplishment of the mission. In addition, it is an established policy to grant to the commander in these cases not only the full responsibility and the available means, but also the widest exercise of initiative in carrying out his mission.

The task force system results in the organization of fighting teams composed of units from the army, the navy and the air forces. This system substitutes interdependence among the fighting branches for the independent or separate control method sought by the army, navy and air forces in other nations. By carefully determining the forces, *i.e.*, the tools, required to perform the task, this system permits close control and full co-ordination in accomplishing the particular objective. So far as Germany is concerned, and insofar as the German armies reflect the national will, this type of organization was successful during more than two years of modern warfare.

Tactics.—The outstanding military development shown by the German action in campaigns has been the successful use of armoured and air forces in close and continuous co-ordination with other ground troops. During 1941, and principally in the campaigns in the east, the German armies developed and applied tactics popularly known as the "wedge" and the "kessel." The panzer, or armoured divisions, formed the spearhead of a gigantic phalanx moving toward the opposition. Immediately in rear of the spearhead, motorized divisions are grouped and move forward at the same speed. This phalanx, or armoured wedge, sought to create openings in the enemy line. As the advance of the wedge continues, second line infantry divisions move up on the flanks increasing the width of the wedge and decreasing gaps between wedges. The strategic rate of speed of the whole force is based on the march rate of the infantry divisions. Once the shock wedges create gaps, they form the walls dividing the parts of the enemy line which have become separated. The shock wedges then swing right or left to surround the sectors which have been

Table III—*Comparative Strength of the Chief Warring Powers**

Area and Population

Taken from *New York Times* of Dec. 14, 1941.

For naval forces *see* NAVIES OF THE WORLD. For aircraft combatants *see* AIR FORCES OF THE WORLD.

The United States department of commerce—census bureau—according to a *New York Times* dispatch dated Dec. 17, 1941 estimates Allied manpower between 18 and 35 years of age to be 56,643,000. The same dispatch indicates a census bureau estimate of Axis manpower in the same age group to be 28,560,000. The newspaper account indicates that these totals do not include figures for China, India and the Dutch East Indies. Including these nations the Allied total is estimated as 163,887,000.

The reported estimates appear to be based upon the following:

Allies		Axis	
United States and possessions	22,796,000	Japan	10,839,000
Russia	23,574,000	Germany	11,281,000
England (not including India)	10,273,000	Italy	6,440,000
	56,643,000		28,560,000

*Corrected for known losses up until Dec. 12, 1941.

split off from the main body of the opposition. Then the infantry divisions in rear of the cutting edge of the wedges move forward and carry out the encirclement and destruction of the enemy groups which have been separated and cut off. This encirclement and destruction represent the final play of the tactical move. This action is known as the "kessel." The word "kessel" is adapted from a hunting term applied to the practice of encircling game, driving it toward the centre, and destroying it. In the tactical sense, the rapid creation of gaps at weak points in enemy lines, the cutting off of sectors of the line between gaps, the rapid inrush of infantry troops to encircle these sectors and eventually destroy the opposition, have all become a continuous sequence of the German tactics as practiced on the modern battlefield. Throughout this type of operation the combat air forces prepare the way and then give continuous support to the ground forces. Overhead the air forces operate immediately in front of the advancing elements of the wedges and later join in the destruction of the encircled enemy forces. The outstanding characteristics of the whole tactical operation can be summarized as follows:

A. Concentration of armoured forces and motorized infantry elements in a spearhead or wedge attack.
B. Shock action to create gaps at one or more weak spots.
C. Rapid separation of the enemy line into several sectors.
D. Swift encirclement and relentless destruction of the surrounded elements.

The adoption by the German army of the task force organization, and the tactical development of the "wedge" and "kessel" type of air-ground action, do not indicate excessive rigidity in the composition of forces or in the conduct of operations. On the contrary, this type of organization and the co-ordination of all arms which it insures permit great flexibility within command channels, and introduce fluidity in tactical movement. The task force may be of any size and may include a few or several units from one or all the armed services. The close co-ordination of air and ground combat units allows maximum mobility and rapidly brings pressure against predetermined weak spots.

Other elements of interest in the composition of the German armies as indicated in reports of operations during 1941 are discussed in the following paragraphs under appropriate headings.

Combat Troops.—During 1941 two types of armoured division, the large and the small size, appeared. The main difference is noted in the tank brigade, either medium or light, which is integral with the large division while the small division has a light tank regiment.

Motorized Division.—Motorized divisions consisting of artillery on self-propelled mounts, motorized reconnaissance units, some tank units and motorized infantry, have accompanied the armoured divisions. The result is that a strong infantry-artillery team is thus made available to capitalize on the advantages gained by the air-ground support and armoured divisions.

The German armies have developed a number of anti-tank weapons which are moved on self-propelled mounts. These weapons have similar characteristics in that each is designed to deliver effective fire power from a mobile base or platform. In use these anti-tank weapons are grouped in "tank destroyer" units which appear to be loosely organized and as yet not co-ordinated in any fixed form applicable to all parts of a German field force. The development is significant since it emphasizes that experience gained in actual combat indicates a need for an organic anti-tank force. The trend of development appears to be toward masses of roving mobile guns, capable of offensive as well as defensive action, comprising mainly self-propelled armoured gun mounts, accompanied by air and ground reconnaissance units as well as some motorized infantry and pioneer services.

Miscellaneous.—Other developments in the German armies include the appearance of parachute troops in large numbers, some units equipped with camouflaged chutes; air-borne infantry in transport planes and, in some cases, in towed gliders; flame-thrower units for close-in attack of small fortifications; the substitution of the German civilian "volkswagen," or small commercial passenger automobile adapted for military use, in place of the motorcycle; amphibian tanks of medium size, 25-30 tons, transported to coastal waters on shallow-draught carriers and also capable of making river and stream crossings; the employment of dogs with ground reconnaissance and patrol units; the development of reconnaissance units consisting of light troops including cavalry, horse and mechanized cyclists, armoured and scout cars, and a co-ordinated messenger service, the wide use of inflated rubber pontoons and other boats and improvised rafts; the front line employment of pioneer units incorporated in motorized divisions and also in the reduced size panzer or armoured divisions.

In addition to these developments mention should be made of the German perfection of their methods for combat exercise training; march discipline; traffic control; supply; medical, veterinary, provost and postal services; extension of the labour battalion service; and the introduction of a semi-military corps of civilian officials performing rear area duties and releasing large numbers of military personnel for combat zone service.

Above and beyond all these particular developments, each important as an example of actual combat experience, are the improvements in air power and especially the co-ordination between air and surface (both ground and water) units and the substitution of mass air bombings for the time-honoured duel between masses of artillery guns.

Summary.—The German nation is organized for continuous and unlimited support of the single purpose: the prosecution of total warfare. The type of organization employed permits the creation of flexible task forces incorporating predetermined percentages of army, navy and air force units, trained to accomplish a specific job under the command of a single commander chosen for the particular task. Combat experience indicates that interior organization of combat units permits rapid reorganization to meet local needs with a marked tendency toward increase in air forces and panzer or armoured divisions. In all cases there has been improvement in combat air operations co-ordinated directly with ground operations, while strategic air combat continues as a separate air activity.

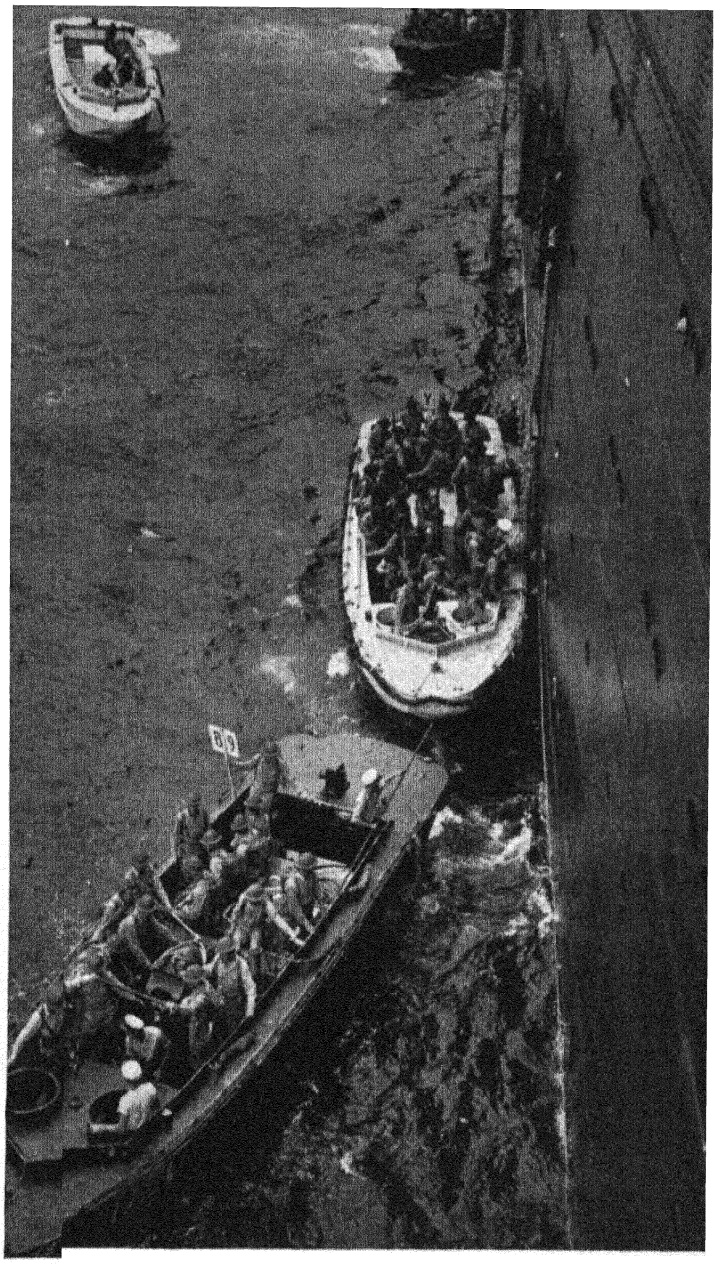
German authorities without underrating the importance of the support received from all elements of the home front, attributed the success of German armies to the following military factors:

A. The strategic and tactical employment of air power.
B. The employment of armoured forces and motorized infantry.
C. The aggressive action of ground divisions on foot accomplishing the complete elimination of effective opposition.

Great Britain.—After 16 months of warfare the British armies by Jan. 12, 1941 had been forced out of the principal areas of western Europe and had been limited to operations in Africa, the near east and the defense of the British Isles. During 1941 increasingly large forces from the British dominions and colonies joined with British forces to extend military operations in new theatres of war. These developments introduced several changes in the British types of army organization and required modification in the application of the basic British theory of combat.

While the campaigns in Greece and Crete, the operations in Libya and Egypt, and the British success against Italian armies in East Africa all varied in particulars, each contributed marked changes resulting from actual combat experience. The conduct of the several campaigns is discussed under WORLD WAR II. An examination of the British armies indicated the following basic developments.

Theory of Combat.—The general war policy of the British has been based upon defense of the outlying posts of the empire and



Above, left: ANTI-AIRCRAFT BATTERY in action at Lake Charles, La., during war games of the 3rd U.S. army in Aug. 1941

Above, right: U.S. MARINES rehearsed in landing boats in 1941 alongside the ex-liner "Manhattan," converted into a troop transport ship

the defense of the British home front. This theory has not changed in its basic concept, but the development of methods to accomplish these objectives, and the application of these methods, resulted in changes in army organization and battlefield tactics. While beyond the home front limited campaigns have been conducted, at home the theory of defense still applies with greater emphasis on air and anti-air activities defensively, plus development of offensive air power, coupled with widespread civilian defense and industrial mobilization.

The results of these activities have been seen in the creation of a large armed force in England. The first step in this development was a careful selection of men for service with the army, the navy and the air forces. This selection process permitted the assignment of men especially qualified for each branch, and also permitted the adoption of a school system wherein men were trained for specific duties. In conjunction with this selection system, the British started large-scale training programs to develop apprentices in all war industries, and adopted a civilian draft law which permitted the assignment of all able-bodied men and women to civilian tasks according to ability. Within the British Isles the whole population was included in plans for home defense. Civilian air-raid warning service was established. Air-raid precaution programs engaged millions of civilians as wardens, firemen, medical attendants and in associated tasks. In the military services the development of radio and other means for detection of enemy aircraft, the improvement in anti-aircraft defenses, and the great increase in air defense over the islands as well as air offensives against the invasion coast and against military objectives in Germany, all marked the changes in defense of the British home front. The national productive capacity was organized to meet the requirements of the war effort. Meanwhile, defense plans had to provide protection for vital water and land communications. The whole character of British defense methods had been changed to meet the continued air attacks and the ever-present threat of invasion. Considerable success had been made in the development and in the actual operations of all these methods of defense. Particular success had been accomplished in air tactics, anti-aircraft defenses and the civilian air-raid warning and precautions agencies.

In both cases the British theory, while modified by developments in 1941, still necessarily rests heavily upon the use of naval power and still employs naval strength to establish confining blockades, to maintain communications between combat zones and the home front, and to insure the uninterrupted flow of supplies for war purposes. Any discussion of the British armies must include reference to this initial reliance upon sea power, the rapid development of air power both defensively and offensively, and the demands for interior reorganization of units resulting from actual combat experience.

Some of the other developments within the British armies included: increases in mobile artillery operating with ground infantry; creation of mobile anti-tank defense units; gradual growth of tactical air combat co-ordination with ground forces; application of battlefield mobility particularly in open desert warfare; improvement in battlefield communications. Weaknesses noted included shortages in modern tanks, anti-tank weapons and mobile anti-tank weapon carriers; failure to secure flexibility in organization of armoured forces permitting large-scale operations for sustained periods; inadequacy of motor maintenance and supply systems; shortage in combat aviation for co-ordinated use with ground forces.

Summary.—At the close of 1941, British armies were denied a foothold on the western European peninsula. Brilliant success had marked the stubborn advance of independent forces in East Africa, and periodic but erratic success had been accomplished in open mechanized ground and air combat in northern Africa. On the whole, British forces were employed in long-range defensive warfare with occasional aggressive actions resulting in limited gains except in East Africa where decisive results were achieved. A gradual scheme of reorganization was noted, more pronounced in the campaigns in North Africa than in other theatres. All land action appeared to be greatly influenced by naval action and strategic air combat as well as more extensive employment of armoured and mechanized ground forces. Morale appeared to be superior on all fronts. The British armies appeared to be slowly approaching the strength required to launch sustained attacks seeking a decisive victory.

Engaged with enemies in Europe employing land-based armies relatively independent of sea-borne supply and communications, and forced to employ her navies for both Atlantic blockade and convoy duty as well as open warfare in the Pacific, Great Britain continued to rely on naval strength and air power to establish an eventual superiority permitting her reorganized and re-equipped land armies opportunities for decisive operations.

Italy.—Italian armies continued to play a minor role in the operations of axis forces during 1941. The Italian theory of combat has always included the creation of a strong defensive base within Europe, permitting the initiation of limited offensives supported by naval action and strong combat air action. The first 16 months of combat proved that the Italian theory could not be supported in practice. Severe defeats were inflicted by the Greeks in western Greece and in Albania. Initial success in Libya had been seriously threatened by the rapid sweep of British forces to the west. In East Africa, victories over poorly equipped native forces were subject to strong British offensives. All Italian action during 1941, on a scale large enough to allow analysis of strategic and tactical importance, was confined to northern and eastern Africa. Italian operations in the Greek and Russian theatres appeared to be minor, and existed apparently despite Italian inactivities.

East Africa.—In this theatre Italian armies, estimated at about 110,000–200,000, were engaged at widely separated points by independent British forces during 1941. Shortages in basic supplies of food, fuel and ammunition; limited capacities for motor maintenance; the loss of supply routes due to inferior naval and air power; and the guerrilla warfare employed by native troops, all contributed to Italian defeats. Italian organization includes modern armoured forces as well as motorized divisions and especially emphasizes the characteristics of units trained and equipped for mountain operations and desert warfare. It is unlikely that the full strength of the Italian forces was ever employed in East Africa since the lack of basic supplies and the continued inferiority in the air and naval strength precluded the initiation of long-range offensive action. The armies appeared to split up into independent forces, each adopting local defense tactics and all employing to the fullest extreme the advantages of the difficult terrain. Defense tactics indicated excellent organization of the limited field artillery forces and stubborn local defenses within the limitations of available equipment.

Summary.—The Italian armies were engaged in numerous campaigns in Greece, Albania, North Africa, East Africa and the Ukraine during this period. No major offensive produced decisive results. Defensive actions in East Africa were stubbornly fought and indicated improvement in Italian artillery organization despite the loss of the defended areas. The Albanian offensive was a failure. Minor offensives were launched in Africa on limited objectives by Italian mechanized and motorized forces. Joint Italian and German forces launched larger offensives in northern Africa, and Italian ground and air forces operated in Greece and in the Russian theatre with German columns. Shortages in modern mechanized equipment, limitations on air action, probably due to inadequate pilot and ground organizations, and the ever-present restrictions on land operations in Africa where supply lines by sea were subject to British naval and air attack, all contributed to reducing Italian operations to minor importance. In addition it became apparent that the Italian civilian support was not wholehearted and many were not in favour of Italian participation in the war. All Italian army activities were seriously affected by geographical distributions within the continent and overseas in Africa, by the primary importance of naval and air action in the Mediterranean sea, and basic limitations on modern supplies made available from an apparently reduced and disorganized industrial capacity.

Russia.—The Russian armies were engaged in major offensive action with the German armies during the period June to Dec. 1941. The Russian theory of combat has been based upon a strong defense of the land frontiers of the far-flung soviet union with emphasis upon air and ground action and with naval strength considered a secondary part of the national defense. Early indications of Russian army organization, noted during the Finnish campaigns and during the westward expansion of the Russian state during 1939 and prior to the German attacks in 1941, suggested that numerically Russia was strong in manpower and in machines. However, the conduct of operations in those periods indicated many faults in the leadership and organization of this strength for use in battle. The first six months of warfare against Germany showed a change in Russian strength and in the conduct of operations. Without launching a large co-ordinated land and air attack, Russian armies fought brilliant delaying actions and adopted dagger-thrust attacks of limited extent in ground distance, but of serious counter-effect against German columns until the start of full-scale offensives in mid-December. Siege operations at Leningrad and Odessa and later at Moscow indicate a complete organization of both armed services and civilian

population for land defense. Russian tactical doctrine appears to include strong resistance in depth coupled with stubborn delaying action in all cases, frequently including adoption of minor siege operations where large forces were surrounded by the opposition. In equipment the Russian armies appear to have considerable numbers of all classes of vehicles and weapons. Some doubt appears to exist as to the efficiency of this equipment as much of it seems to be below the standard of modern design. Maintenance of mechanized equipment appears adequate wherever relatively stable conditions of warfare permit. In the air, Russian operations have given indications of larger air forces than expected. The campaign has produced no unusual characteristics of Russian organization or doctrine except the success achieved in delaying actions and the extent of losses inflicted on German air and ground forces. The operations in the closing weeks of 1941 indicate an adherence by the Russians to their old tactical conception of weakening an enemy through attrition, weather and length of supply lines, when counteroffensives for decisive results are undertaken. The offensive was undertaken in the southern area near Rostov and the Moscow front at the close of the year.

Summary.—The Russian armies, engaged in full-scale operations along an extensive land front, fought brilliant defensive actions both in the air and on the ground. After the initial onrush of the Germans, they seemed to regain cohesion and adopt co-ordinated offensive action. Local defense actions, principally the defense of cities, indicated a high degree of perfection in artillery and infantry organizations. Except for the offensive action undertaken in the southern and Moscow theatres late in December little opportunity was afforded observers to examine Russian tactical doctrine. Equipment at the beginning of the war appeared satisfactory. Large demands were made on American industry to meet Russian calls for assistance in securing replacements of all classes. All Russian army activities were affected by the successful extension of industrial capacity from western areas to the Ural mountain districts; the increase in British and United States assistance; the continuation of German attacks despite heavy losses; and the developments in the far east. Only limited observations were available by report due to the small number of foreign observers given access to records, the extent of the area involved and the necessary limitations imposed by censorship.

Japan.—The Japanese armies extended the area of operations during 1941 by moving to the south into Indo-China, and by the joint army and navy operations undertaken in December against the United States and Great Britain in the far east and the Pacific. The Japanese theory of combat has been offensive, dependent upon the home islands as a base of operations supporting joint naval and land action in Asia. In practice the Japanese armies have been engaged principally on the continent against large but relatively unorganized and poorly equipped Chinese forces. Japanese organization parallels the modern army types, modified to suit the requirements of terrain and opposition encountered in China, and the limited Japanese raw materials. Some success has been accomplished against organized Chinese forces and fortified Chinese positions. At all times Japanese forces appeared less effective against unorganized Chinese guerrilla attacks. Japanese operations in the air appear to be extensive against weak opposition from enemy air and ground defenses. All Japanese army operations were mainly dependent upon the maintenance of sea-borne supplies and the continued increase of national industrial capacity. The naval fleet and air operations, particularly in the closing weeks of 1941 which marked the opening of major warfare against the United States and Great Britain, overshadowed the army operations. However, extensive army attacks were developing against the Philippine Islands, Singapore and Hongkong, which fell on Dec. 25.

Summary.—It appears that the Japanese armies are fairly well equipped with modern machinery and capable of maintaining more than 2,000,000 experienced soldiers in the field. During the prolongation of the combat operations in China, large numbers of Japanese units have received actual battlefield experience. All army operations have been characterized by the type of Chinese resistance which appears to have been for the most part unorganized and of the guerrilla rather than modern field army form. No decisive land actions have resulted from Japanese army operations. Considerable co-ordination has resulted from joint naval and army actions, and extensive experience has been gained from air activities against weak resistance. The limited period of Japanese operations during the closing weeks of 1941 indicated more naval and air activity than army activity, although landings were made against Hongkong and in the Philippines and on the Malayan peninsula by ground forces. Limitations of censorship and the brief period covered by these operations preclude extensive analysis of Japanese army characteristics.

China.—The Chinese forces were engaged in major warfare with Japanese armies throughout 1941. Chinese armed forces were estimated at about 5,000,000 including unorganized but effective guerrilla groups. Wherever stable, organized units existed, the Chinese army resembled the modern field armies, but were short of modern equipment. In all cases, the glaring shortages of modern equipment rendered ineffective any large-scale attempts to engage in full-size tactical operations. Limited offensives were undertaken with frequent spectacular success wherever equipment and training permitted. For the most part, air operations were unco-ordinated with ground operations and were limited to harassing bombing activities. The Chinese theory of combat is entirely defensive in character. The initiation of offensive tactics in all cases depended upon supplies of all classes, the training of guerrilla groups for joint action within larger organized field forces, and the gradual extension of a national understanding of the need for and support of a major co-ordinated effort against the invader.

Summary.—Limited offensive actions were undertaken by relatively small but determined forces. Industrial capacity was low and imports limited to supplies received over the Burma road. All army operations were affected by the extent of the area involved, the delay in creating a national effort, and the extension of the war outside the Chinese mainland. Japan was unable to secure decisive results against Chinese forces.

United States.—During 1941 the United States continued large-scale manoeuvre training programs within continental limits, increased the strength and defenses of newly acquired bases and existing overseas garrisons, and approached the close of the year with a greatly improved and considerably larger army than the nation had ever known in times of peace. On Dec. 7, 1941, Japan launched surprise attacks on Pacific garrisons and declared war on the United States. On Dec. 11, 1941, Germany and Italy declared war on the United States. These events, followed by prompt U.S. declarations and the extension of military service to the close of hostilities, emphasized not only the results attained to date but the serious duties facing the army in the future. The theory of combat of the United States army has always been offensive. Foreign wars have always been fought by joint naval and land operations based upon a strong home front furnishing required replacements of men and supplies. Overseas garrisons have always been reduced to a minimum strength frequently considered far below potential needs. During times of peace, and particularly following World War I, the natural desire of a civilized state to abjure war and refrain from hostilities resulted in a drastic reduction in numbers and severe limitations on training and adequate procurement of modern supplies for even a small force.

The rise of dictatorships and the spread of World War II resulted in an increase in strength, principally by means of a draft. As the tempo of war increased, the United States turned to the production of war supplies for the armies opposed to Germany, Italy and Japan, and in turn to meet the expanding needs of its own army. The year 1941 was marked particularly by the organization and transportation of modern units to defend outlying bases and possessions, by the completion of large-scale field army manoeuvres, by advancing the organization of large army units, and by the organization of a vast production plant. (*See* also DEFENSE, NATIONAL [U.S.]: *Armed Forces.*)

Organization.—The United States armies are organized as field forces for administration and training within the continental limits, and as task force garrisons within outlying bases and possessions. The air forces remain as parts of both the army and the navy and do not constitute an independent army, but within the army have virtually an independent status.

In 1941 the creation of higher staffs and the organization of field army and army corps troops and higher air force echelons developed concurrently with the expansion in numbers of ground divisions, air and other units. The outstanding development in these respects was the separation of tactical field forces under a general headquarters (GHQ) from the territorial administration and supply activities within nine geographical areas. At the close of the year, these changes had proved to be desirable and rapid advances had been made in the conduct of training and the gradual creation of large-sized field army fighting teams. All developments within these armies were subject to the gradual acquisition of adequate modern equipment. In general, the training program progressed at a rate permitting all ranks to be prepared to use the new equipment as rapidly as it was received. Some shortages existed at the close of the year and some elements of training, notably combat firing, had been delayed due to these shortages. At the close of 1941, faced with war against three nations in Europe and the far east, the United States army was far better prepared for action than it had been when it entered World War I in April 1917.

Tactical Doctrine.—The experience gained in World War I plus development and utilization of modern armament had created within the field army command the basic elements of modern battlefield tactics demonstrated by nazi forces since Sept. 1939, but formulated to suit American characteristics. This doctrine included the close co-ordination of combat aviation with ground forces; the maximum development of battlefield mobility as well as strategic mobility; the rapid advance of striking forces to create gaps at weak spots; followed by the eventual encirclement and destruction of the opposition. While the forces comprised infantry and cavalry divisions, armoured divisions and air forces, the doctrine contemplated a close integration of all these branches; at the same time making the air forces available for independent action.

Factors beyond military control resulted in postponement of such organization or training until 1941. During this year, the gradual increase in manpower and the increasing supplies of modern machinery permitted the resumption of original plans for reorganization and large-scale training programs. Armoured divisions were organized and some motorized divisions were created. Ground infantry divisions were reduced in size (triangular) within the regular army, and a start was made in similar reorganization with national guard (square) divisions. The air forces were grouped into higher commands, each comprising a bombing command, interceptor command and an air ground support command.

An outstanding development, resulting from the final army manoeuvres completed in November, was the success achieved in the use of small, highly mobile "tank attacker" units in offensives against armoured and mechanized attacks. These units, improvised for the particular manoeuvres, consisted of 50 calibre, 37-mm. and 75-mm. weapons mounted for direct fire from protected self-propelled mounts, motorized infantry, combat engineers, light reconnaissance elements and small, included, combat and observation aviation. This introduction of "tank attacker" units; the development of accompanying air support units; the extension of mobile reconnaissance agencies; the organization of ground and air warning units; and the perfection of supply services, all under a single commander, were marked improvements in tactical development within a field army.

Summary.—The United States army numbered approximately 1,800,000 at the close of 1941. Extensive problems remained unsolved in the procurement of officer personnel; the rapid reorganization of required tactical field forces; the acquisition of adequate modern equipment; the continued expansion of enlisted replacements; the perfection of air-ground co-ordination; the organization of armoured forces and expansion of anti-tank and anti-mechanized units; and the acceptance of a system of unified command for combat forces including all elements of the armoured services and designed to accomplish specific combat missions. The national support necessary to meet all these requirements was crystallized and guaranteed by the declarations of war made by Germany, Italy and Japan in Dec. 1941. The broad outlines of the combat phase ahead indicated extensive joint naval and land operations with increased importance for all strategic and tactical air operations.

The year 1941 closed with an aroused and powerful nation rapidly preparing to organize, equip, train and lead in combat the most powerful armed force the world has ever known. The actual operations during the last weeks of the year were limited in scope and the details shrouded in

the necessary safeguards of wartime censorship.

Other Armies of the World.—After 28 months of warfare, the armies of the following countries disappeared as organized independent forces, either as a result of defeat in battle or due to change in national political association with axis powers: Albania, Belgium, Bulgaria, Czechoslovakia, Estonia, Latvia, Lithuania, France, Holland, Denmark, Norway, Hungary, Rumania, Greece, Poland, Yugoslavia. No information had become available of the size and composition of armies absorbed within the German system. Finland was considered allied to Germany.

Whenever small forces escaped to join governments in exile the nucleus of a new army had been formed and joined the Allies. Nations so represented included: Holland in the Dutch East Indies, Free France in Africa, Poland, Norway, Belgium, Czechoslovakia and Greece. These forces varied from a few patriots to forces small in size but well organized and partly equipped.

For a complete list of the nations allied against Germany and of those allied with Germany, see table on page 731, in WORLD WAR II.

Neutral states as of Jan. 1, 1942, included the following: Argentina, Brazil, Chile, Ecuador, Mexico, Paraguay, Peru, Portugal, Spain, Sweden, Switzerland, Turkey and Venezuela.

Conclusion.—The spread of World War II brought nearly all of the organized armies of the world into conflict at the close of 1941. Table III on page 71 indicates the nations engaged and the size of armies participating in warfare. (*See* also AIR FORCES OF THE WORLD; CHEMICAL WARFARE; MARINE CORPS; MUNITIONS OF WAR; NATIONAL GUARD; NAVIES OF THE WORLD; WORLD WAR II.) (H. A. DR.)

Armour, Allison Vincent (1863–1941), U.S. yachtsman and specialist in plant and archaeological research, was born March 18 in Chicago. Sponsored by the department of agriculture, he made eight voyages aboard his yacht to remote regions for plant and biological research. In 1932, on a trip to the West Indies, he collected rare plants and vegetables which might be introduced into southeastern U.S., and he also made important archaeological discoveries on the islands. In 1931 Armour received the Frank M. Meyer medal, awarded by the American Genetic association for plant exploration. He was an honorary fellow of the New York Academy of Sciences. Armour died in New York city, March 6.

Arnauld De La Periere, Lothar Von (1886–1941), German vice-admiral, was born March 18 in Posen, Germany. The son of a former government official in Potsdam, and a descendant of a French immigrant who became a major general in the army of Frederick the Great, the young Arnauld de la Periere received his early training in cadet schools and at the age of 17 entered the imperial navy. In 1906 he became an officer and from 1913 to 1915 he was adjutant to the chief of staff. From 1915 to 1918 he was commander of two U-boats in the Mediterranean. Germany claimed that he was responsible for the sinking of 200 Allied ships totalling more than 500,000 tons during World War I. Named commander of the German naval forces in occupied France in 1940, he was killed Feb. 24 in an accident, the details of which were not divulged by German authorities.

Arnold, Henry H. (1886–), U.S. army officer, was born June 25 in Gladwyn, Pa. He was graduated from West Point in 1907 and served in the Philippines until 1909. He set an altitude record in 1912, was awarded the Mackay trophy for a reconnaissance flight in the same year and was the first aviator to use radio in reporting artillery fire observed from a plane. During World War I, he headed the information service of the signal corps's aviation division and later became assistant director of military aeronautics. Gen. Arnold led a round-trip flight of army bombers to Alaska in 1934 and was awarded the distinguished flying cross in the same year. He was named assistant chief of the air corps, 1935, and major general, chief of the air corps, 1938. In Oct. 1940, he became the nation's first acting deputy chief of staff in charge of co-ordinating all matters pertaining to the air corps. In May 1941 Pres. Roosevelt made him a full-fledged deputy chief of staff. He went to England in the spring of 1941 to exchange technical ideas with British air experts and on Dec. 15, 1941, Pres. Roosevelt named Arnold for temporary promotion to the rank of lieutenant general.

Arsenic. World consumption of commercial arsenic—that is, the white oxide, and not the metal itself—is of the order of 60,000 metric tons annually, about one-third of which is produced in the United States; other producers of importance are Sweden, Mexico, Australia, Belgium, Germany and Japan. The United States is the largest consumer, taking about half of the total. The 1940 output increased to 24,983 short tons, and sales to 23,339 tons, which was supplemented by 9,929 tons of imports, less 1,600 tons exported, leaving a total supply of 31,700 tons. Both exports and imports decreased about half. Sweden alone recovers enough crude arsenic to supply the entire world demand, but only a small fraction of it is refined and used, the surplus being held in storage, this having been found to be the cheapest way to dispose of the heavy arsenic content of the Boliden gold ores, even though transportation charges and cheap supplies in other countries prevent its shipment and use.

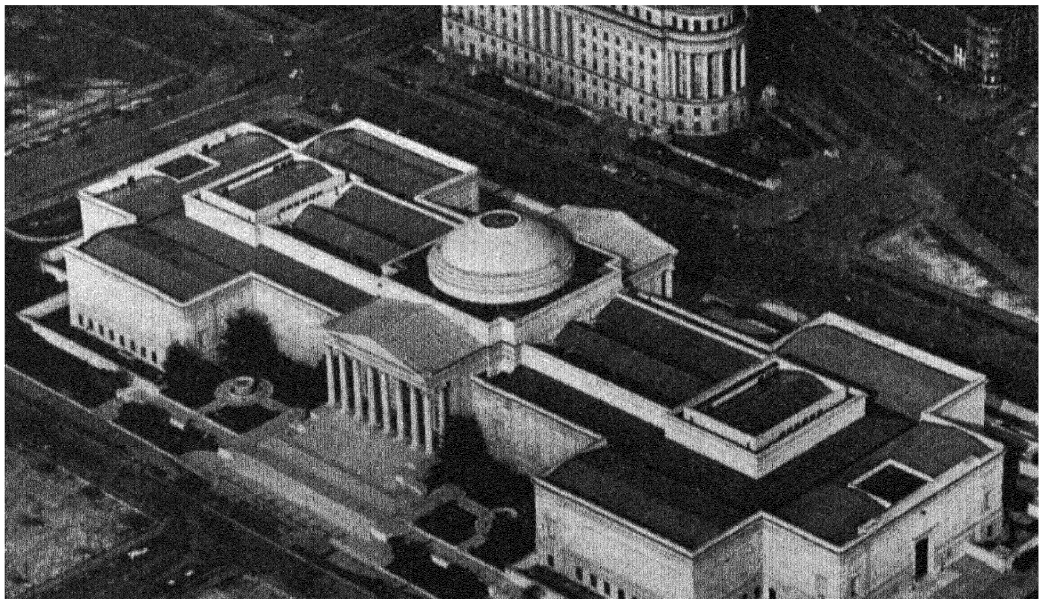
Art Exhibitions. The war necessarily confined most exhibitions to the western hemisphere, where surveys of the art of a people or period proved popular. Spanish Painting was shown at the Toledo Museum of Art and Paganism and Christianity in Egypt at the Brooklyn museum. Baroque Italian Painting was reviewed at San Francisco's California Palace of the Legion of Honor and Indian Art of the United States was featured at New York's Museum of Modern Art. Australian Art began a tour of the United States with a first showing at the National gallery, Washington, D.C. The Metropolitan Museum of Art and the Art Institute of Chicago exhibited French paintings and drawings lent by the museums and collectors of France. The influence of world affairs was



THE NATIONAL GALLERY OF ART at Washington, D.C., gift of Andrew Mellon, was dedicated March 17, 1941 by President Roosevelt

evident not only in the prominence given Australian art but also in the display of Modern Mexican Painters at the Boston Institute of Modern Art and in the special section devoted to Mexico and Latin America in the Art Institute of Chicago's Twentieth International Exhibition of Water Colors. A national tour of Latin-American prints was sponsored by the International Business Machines corporation, which also backed the collection of contemporary art of the western hemisphere seen throughout North America. Three exhibitions of North American art circulated in Latin America as a result of the co-operation of the official Pan-American cultural relations committee and a group of American museums. America and Americans came to the fore in such exhibits as the new Santa Barbara museum's Painting Today and Yesterday in the United States, the Whitney museum's This Is Our City, the Baltimore Museum of Art's A Century of Baltimore Collecting. Fifty Oncoming Americans were on view at the Springfield Museum of Fine Arts and at the Boston Institute of Modern Art. Outstanding among the annuals and biennials were the Art Institute of Chicago's Fifty-second Annual Exhibition of American Paintings and Sculpture, for the first time chosen entirely by the museum, the Carnegie Institute of Pittsburgh's Directions in American Painting, which gave a chance to those Americans who had never shown in its International, and the Syracuse Museum of Fine Arts' tenth exhibition of ceramics, which for the first time included work from all the Americas.

The most noteworthy exhibitions in 1941 devoted to the art of one man were the Art Institute of Chicago's superb Art of Goya —Paintings, Drawings, and Prints; and Duveen's review of Renoir. Other interesting one-man shows, featuring the work of 19th or 20th century artists, included Faggi at the Albright Art gallery in Buffalo, Max Weber at the Associated American Artists, Iver Rose and Louis Bosa at the Schneider-Gabriel galleries, Nordfeldt at Lilienfeld's, Esther Williams at Kraushaar's, Robert Gwathmey at the A.C.A. gallery, Speicher at the Rehn galleries. Mary Cassatt was shown at the Baltimore Museum of Art, Mangravite at the Art Institute of Chicago, Jerome Myers at the Whitney, Joan Miró and Salvador Dali at the Museum of Modern Art. The late Emil Ganso was on view at the Whitney, at the Philadelphia Art Alliance and at Weyhe's. Sepeshy was seen at the Midtown, Souto at Knoedler's, Mario Carreño at the Perls gallery, and George Grosz both at the Walker galleries and the Museum of Modern Art. Old masters featured included El Greco at Knoedler's and Joos De Momper at Mortimer Brandt's.

Among the most unusual exhibitions of the year were the following: the Metropolitan's China Trade and Its Influences; Knoedler's show in honour of Cortissoz's 50th year as an art critic; Italian Drawings, 1330–1780, at the Smith College Museum of Art; prints and books published by Vollard at the Brooklyn museum; the First Century of Printmaking at the Art Institute of Chicago. • (D. O.)

Art Galleries and Art Museums.

The year 1941 began a critical decade in art galleries and museums. In England 1941 opened with some of the heaviest bombings of London in which priceless monuments and churches were destroyed by the enemy, including the famous auction rooms of Christie's. On March 17 the United States sounded a note of hope and gave refuge to unique works of European art with the opening of the National gallery in Washington. On Dec. 7 with Japan's attack on the United States, decades of progressive art collecting changed direction, and curators' plans were revised overnight from that of solely acquiring works of art to protecting them also from bombs. Following the example of England, museum directors emphasized the importance of art in wartime, as air raids of the kind that would be attempted in the United States would be directed not so much at killing people or destroying military objectives as at crushing morale. In England more books were printed than ever before, and art magazines came out regularly even when bombed out of their offices.

Certainly the most important event of 1941 was the opening of the National Gallery of Art in Washington, D.C., on March 17, when President Roosevelt accepted the gifts of the late Andrew J. Mellon and Samuel H. Kress and others for the nation. The late Andrew J. Mellon gave the building with an endowment and bequeathed 122 outstanding European paintings and 23 pieces of sculpture of the finest European schools. Samuel H. Kress donated 375 paintings and 18 pieces of sculpture of notable quality. By July 27, four months after the opening, the millionth visitor had entered the museum.

The summation of losses from enemy bombs to museums and contents in Europe during 1941 served two purposes: first, to make all realize the extent to which axis dictators will go in destroying civilian property which has no military value whatever; and secondly, to demonstrate the disadvantages of antiquated museum architecture in coping with the problems of life today. The extent of the damage to the superb early Greek objects in the museum at Candia, Crete, had not been published up to Jan. 1, 1942. Irreparable injury was caused in London when (on the night of Dec. 19, 1940) the enemy dropped 10,000 incendiary bombs on the city, destroying nine churches, among them Wren's St. Lawrence Jewry, St. Vedast and St. Bride's. The Guildhall, built in 1411–35, was burned down to the walls. Stationer's hall (built 1670) was devastated with a loss of 5,000,000 books. Grave damage was done to Trinity house and to Dr. Johnson's house in Gough street. The Inns of Court were in ruins.

Similar damage was done in Liverpool, where the City museum was destroyed by fire while the Walker gallery had a narrow escape. In May the Portsmouth City museum was demolished. The Bristol museum had already met a like fate. The Southampton Art gallery was badly damaged when a bomb crashed into a shelter full of children. The Bootle Museum and Art gallery, the Sunderland Public Museum and Art gallery, the Williamson Art Gallery and Museum in Birkenhead, the Birmingham City Museum and Art gallery, and the Coventry museum all suffered severe damage. In Hull, Old Time street with its series of original store fronts was completely demolished. The Museums and War Damage act was set up to insure museums against losses.

Reports from France stated that the Louvre, the Trocadero and the Luxembourg museum had not been stripped by the nazis but were left partially open to the public for their value as important tourist attractions after the war. However, important Jewish collections were confiscated and many of them were on view in the Jeu de Paume museum, where they were being sold for relief funds, for example the 17th and 19th century art and the 18th century paintings, and the silver collection of Maurice de Rothschild. Everywhere pictures were in great demand for investment purposes, as they were easy to transport and their value remained constant. The Jewish-owned galleries were open and doing a good business (under the direction of the enemy).

In the United States the public enjoyed displays of refugee art from Europe: the masterpieces of French art from David to Picasso, lent by the Louvre and museums of France, were shown exactly as they left France (before the war) only at the Art Institute of Chicago. Several prominent refugee artists came to the United States and enriched its culture: Leger, Kisling, Ozenfant, Berman, Mondrian, Masson and Chagall, and the sculptors Zadkine and Lipschitz. Exhibitions of paintings and of books were sent on tour to the Central and South American republics in an effort to promote better inter-American relations. Several mu-

seums abolished pay days: the Metropolitan museum in New York and the Cleveland museum. The following were among the important gifts of the year to museums: Mrs. James Ward Thorne of Chicago presented 97 of her architectural models in miniature to the Art Institute of Chicago to be used for educational purposes. The Boston Museum of Fine Arts received the significant Karolik gift of furniture and arts and crafts of the 18th century in the colonies and original states. Yale university acquired an unusual bequest of 450 works of modern art from Katherine S. Dreier. In March, Robert Moses, the New York commissioner of parks, issued a detailed statement stressing what was wrong with New York museums and how they were not relating themselves to the public. In July, William Church Osborn was chosen president of the Metropolitan Museum of Art to succeed the late George Blumenthal, who made significant gifts to the museum in his will. The Metropolitan added a junior museum consisting of a restaurant, workrooms and galleries for children. New York department stores sold works of art from the Hearst, the Clarence Mackay and the W. S. McCall collections. Various exhibits demonstrated the national importance of the art of the American Negro. The new Santa Barbara museum opened in California. (L. B. Br.)

Arthritis. Approximately one-fourth of all patients with chronic arthritis fail to become re-employable due solely to the severity of their disease. The permanent invalidity, however, is a subject which deserves further study. Judging from a review of the effect of the bombing of London on patients with "rheumatism," the added exposure and shock seems to have resulted in some increase in the amount of the disease; individual patients, however, have adjusted themselves well as a rule.

Several studies on the blood chemistry of patients with rheumatoid arthritis failed to demonstrate any significant differences from normal, except in the case of the so-called formol-gel reaction in the blood plasma, which has been found reasonably suitable as an index of the extent of systemic activity of the disease process. In this respect, it is similar to the blood sedimentation reaction. Ordinarily, chronic infectious or rheumatoid arthritis has not been considered as a disease which affects the heart. However, heart lesions have been demonstrated at necropsy in four-fifths of a small group of patients with rheumatoid arthritis.

Further studies of the spontaneous polyarthritis of rats, discovered some years before as having a marked similarity to human arthritis, resulted in one report, implying that two strains of the pleuropneumonia group, one obtained from rats and the other from a patient with acute rheumatic fever, were identical. In connection with the effect of jaundice on arthritis, Snow and Hines found that ligation of the common bile duct of rats prior to or shortly after injection of a culture of a pleuropneumonia-like organism would delay the onset of arthritis and the subsequent degree of joint involvement was diminished. This is an additional element of similarity to the human disease. Using an entirely different type of organism—the haemolytic streptococcus—Rothbard produced an acute multiple arthritis in 45 out of 51 albino rats by the intravenous injection of a strain of this organism.

Numerous additional studies on the role of gold salts in the treatment of arthritis appeared; one of them was reported as an effective chemotherapeutic agent for a variety of haemolytic streptococcus arthritis in rats. Certain gold compounds also were found to exert a curative effect on experimental arthritis produced in mice by a filtrable micro-organism of the pleuropneumonia group. Several groups of investigators, especially in the United States and Great Britain, reported favourable results with certain gold salts in the treatment of rheumatoid arthritis. All however stressed the toxic effects and cautioned against the dangers. The council on pharmacy and chemistry of the American Medical association took a conservative attitude toward the use of gold salts for this purpose. Considerable work was done on the prevention of deformities in arthritis and on reconstructive surgery of joints which had been already badly damaged. The results of repair in some cases were little short of phenomenal.

Art Sales. The war in 1941 stimulated rather than depressed the auction market. In New York, Parke-Bernet's gross sales were $3,606,381, an increase of 54% over the previous year and the biggest total since 1929. The sale of the Mrs. Henry Walters collection was the high spot of the season, bringing a total of $646,684. Important prices realized were $12,500 for Clodion's "Nymph and Satyr" and $16,500 for Boucher's "Le Moulin" and "Le Cours d'Eau." Although the Walters collection was famous for its 18th century French art, the sale's sensation occurred when a Persian silver-woven silk rug was started at $1,000 and climbed steadily to $16,000, the price paid by Miss Berenice C. Ballard of St. Louis. Nearly $500,000 in two days is the record of the sale of the Mrs. B. F. Jones, Jr., collection. Romney's "Captain William Kirkpatrick" went for $31,000 and Romney's "Miss Frances Berresford" for $39,000. A Hobbema landscape brought $30,000, a Nattier $19,500, a Gainsborough rustic scene $16,000, and Turner's "Fish Market on the Sands" was secured by Billy Rose for $15,500. Art property from the estate of the late J. Horace Harding aggregated $183,152. At this sale the record price of the year was reached by Goya's "Victor Guye," for which an anonymous collector paid $34,000. The Plaza Art galleries announced a total of $1,178,789, the result of 61 sales, in the 1940–41 season.

In England the normal activities of the great salesrooms of Sotheby's and Christie's continued and even took on new interest and importance. On April 17 the famous Great Rooms of Christie's were bombed and destroyed, but by May the firm was installed in temporary quarters in Derby house, Stratford place. The jewels which had awaited sale in a safe survived the ordeal of fire and produced a total of £17,700 when sold at Derby house. One of the most successful silver sales was that of the late Sir Lionel Faudel-Phillips' collection. A total of £8,861 was realized by 305 lots. A total of £32,408 was recorded at Christie's in July when gems came under the hammer. From an anonymous source a superb diamond pendant found a buyer at £9,500. At Sotheby's sale of the late H. K. Burnet's Chinese collection 405 lots obtained £6,131 13*s.* An early Chou wine vessel was knocked down for £230. Sotheby's in conjunction with Lofts and Warner sold the H. Yates Thompson collection, which achieved a total of £11,504 19*s.* (D. O.)

Asbestos. Following are the salient data of the asbestos industry in the United States in 1940: production 19,174 short tons, sales 20,060 tons, imports 246,613 tons, exports

4,474 tons, available supply 262,199 tons; all figures are increases over preceding years. More than half of the world supply comes from Canada, where 1940 sales declined slightly to 345,581 tons. Second in importance is Southern Rhodesia, with 58,313 tons in 1939 and 1940 not reported. South Africa produced 27,392 tons in 1940 and exported 22,187 tons. Production was begun in Swaziland in 1939; no figures were available for the year, but output during the first seven months of 1940 was at the rate of nearly 2,000 tons monthly. Nothing was reported from Cyprus after the first quarter of 1940, and operations were probably discontinued. (G. A. Ro.)

Asphalt. United States production of asphalt includes only comparatively small amounts of the native varieties (32,000 short tons in 1940, against 37,360 tons in 1939). The production of bituminous rock rose from 422,484 tons in 1939 to 458,665 tons in 1940; this has an asphalt content of about 10%, and so accounts for a somewhat larger amount of asphalt production. Of far greater magnitude is the output of manufactured asphalt, which was recovered in the refining of petroleum to the extent of 5,069,823 tons from domestic and 1,289,132 tons from imported petroleum in 1940. There are moderate imports of both native and manufactured varieties, but these are more than offset by exports, especially of petroleum asphalt.

Trinidad is the world's largest producer of native asphalt, with an output of 130,315 long tons in 1939, but exports have declined nearly one-half since 1929, due largely to competition from petroleum asphalt. Egypt produces about the same amount as the U.S., and there are a number of minor producers. (G. A. Ro.)

Assassinations. The assassinations of 1941, actual or attempted, included the following:

PAUL COLETTE (centre) being held by French gendarmes immediately after his attempted assassination of Pierre Laval and Marcel Déat Aug. 27, 1941 at Versailles

March 11 Istanbul, Turkey. Time bombs hidden in suitcases exploded as British minister to Bulgaria, George W. Rendel, and his party of 67 entered hotel; Rendel escaped injury, but six of his entourage were killed and 17 injured.

May 24 Tirana, Albania. A Greek poet attempted to assassinate King Victor Emmanuel and Albanian Premier Shevket Verlaci during the former's visit to Tirana; the Greek fired several times into the king's motor car, but all his shots missed.

July 26 Near Montelimar, France. Marx Dormoy, former socialist leader and interior minister in the Popular Front cabinet of prewar France, was killed by a time bomb left by unknown persons in his hotel room.

Aug. 14 Tokyo. Baron Kiichiro Hiranuma, Japanese vice-premier, was shot in the neck and jaw by a 33-year-old assassin who forced his way into the baron's residence in Tokyo; the assailant was apprehended by the police.

Aug. 27 Versailles, France. Pierre Laval, former French premier, and Marcel Déat, pro-nazi editor, were shot and seriously wounded by Paul Colette, a young Frenchman, while they were reviewing a French anti-communist legion in a Versailles barracks.

Sept. 5 Paris, France. Marcel Gitton, French ex-communist leader and former deputy, died of injuries inflicted Sept. 4 by unidentified assailant.

Nov. 9 Baghdad, Iraq. Fakhri Bey Nashashibi, Arab leader and Head of Defense party, was assassinated as he was leaving his hotel.

Association for the Advancement of Science, American: *see* AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

Astronomy. The importance of the Schmidt-type telescope as a new tool in astronomical research is emphasized by the number of these instruments placed in use or under construction during 1941. Two 24-in. Schmidt telescopes were installed in the United States, while two larger instruments were soon to be installed, one in the United States and one in South Africa.

Solar System.—*The Sun.*—One of the great unsolved problems concerning the solar spectrum has been the identity of the lines in the spectrum of the corona. It has been known that these lines, 22 of which have been measured by Lyot, could not be due to any unknown chemical element but must arise from well known elements under unusual conditions. Edlen, in the course of systematic studies of the spectra of highly ionized atoms, has succeeded in identifying 15 of these lines. Two of the lines are due to highly ionized atoms of calcium, seven are due to highly ionized iron and six to highly ionized nickel. The seven lines which remained unidentified in 1941 are all faint, the 15 identified lines contributing approximately 97% of the total radiation from the corona. Several of these identified lines have not as yet been observed in the laboratory, but enough was known about the highly ionized states of these atoms to make Edlen's predictions reasonably certain.

The variation of brightness over the solar disk from the centre to near the limb has been accurately measured, but unsteadiness of the image, due to the effect of the earth's atmosphere, makes such measurement difficult very close to the limb. The best means of escaping this difficulty is to measure the brightness of the crescent phases of a total solar eclipse. Ferwerda, Uitterdijk and Wesselink succeeded in doing this at the Russian eclipse of 1936 by an ingenious photographic method. Their results, published in 1941, indicate that the brightness near the sun's limb varies approximately as the tenth root of the distance from the limb, whereas the brightness nearer the centre of the disk varies as the cube root of this distance. Simultaneous measures of colour show that even during the last minute before totality, when the light was only 1/100 its initial value, there was no change of colour. This constancy of colour suggests that there must be a nearly isothermal layer near the solar surface. Similar results have been arrived at in different ways by Plaskett and by Miss Adam.

Planetary System.—Six comets were discovered during 1941. Two of these were rediscoveries of previously known comets, the others being new objects, one of which was readily visible to the naked eye in the southern hemisphere.

One of the great co-operative observational programs instituted by the International Astronomical union was the program for observing Eros at the opposition of 1931. At this opposition Eros was only 16,000,000 mi. from the earth, and this close proximity of Eros made it an especially favourable object to observe for the purpose of determining a new value of the solar parallax. Jones announced the results of his analysis of thousands of observations made at more than 30 co-operating observatories. After systematic errors of some of the observatories had been allowed for, he obtained the following values for the solar parallax: from all right ascension observations, $8''.7875 \pm 0''.0009$, and from all declination observations, $8''.7907 \pm 0''.0011$. He concluded that the solar parallax must be very close to the value $8''.790$. This material also yielded a new value of the mass of the moon. By using the value $8''.790 \pm 0''.001$ for the sun's parallax, Jones obtained for the ratio of the mass of the earth to that of the moon the value 81.271 ± 0.021.

A comparison of Newcomb's theory of the motion of Neptune with all observations from 1795 to 1938 has been made by Wylie. After reducing all positions to a homogeneous system he obtained corrections to the orbital elements of Neptune which have gratifyingly small probable errors. A by-product of this investigation is a new determination of the mass of Pluto, which Wylie found to be $(0.300 \pm 0.028) \times 10^{-5}$ sun's mass. The mass of the earth is 0.301×10^{-5} sun's mass. Pluto, therefore, appears to have a

AURORA BOREALIS outshone the brilliance of New York city's lights on the night of Sept. 18, 1941. The display was visible throughout much of the northern U.S.A.

mass practically identical with that of the earth.

Observations of the satellite of Neptune by Alden yielded a new value of the mass of this satellite. Alden finds that the ratio of the mass of the satellite to the mass of the system is 0.0013 ± 0.0003. Since the mass of Neptune is about 17 times that of the earth this figure makes the mass of Neptune's satellite 0.022 the earth's mass, or 1.8 times the mass of the moon.

Stars.—*Special Stars and Stellar Structure.*—In a study of the atmospheric structure of Zeta Aurigae, Roach combined his own photoelectric observations with those previously made by Guthnick and by Kron. After adjusting all observations to the same effective wave length, he found that they could best be represented on the assumption that the eclipse is due entirely to absorption of light of the B star by the extensive atmosphere of the K star. An estimate of the number of hydrogen atoms in the line of sight, based on observed intensities of the hydrogen lines in the spectrum, agrees well with the extinction theory of the eclipse.

One of the most interesting and puzzling of the eclipsing binaries is the third magnitude star Beta Lyrae. Thousands of photometric and spectrographic observations of this star have been made in an attempt to solve the puzzling problems it presents. A concerted attack on the problem by a number of astronomers seems to have pretty well solved the puzzle. Kopal and Kuiper treated the problem from the theoretical standpoint and Struve, Greenstein, Page and Miss Gill contributed spectrographic investigations. Notable among these are the discussions of Kuiper and Struve. Beta Lyrae consists of two highly elliptical stars which revolve about their common centre of gravity. Kuiper's mathematical analysis, when combined with Struve's spectrographic results, indicates that the two components of this binary system are so nearly in contact as they revolve about each other that their atmospheres merge. Because of different densities, the attraction of the more dense star on particles between the two will tend to set up a current in their atmospheres. Much of this moving gas will continue to circulate about the two stars, but some of it will escape and form a great spiral of gas about the stars which will take the form of a disk of material lying in the plane of the orbit. The plane of the orbit must be almost edgewise toward us so that the gas in this spiral will come between us and the stars. This is a remarkable model of a celestial object, but it depends on careful dynamical calculations and on a thorough study of the spectra. It explains almost all of the hitherto puzzling features of this system, combining the perplexing observational facts into a consistent and intelligible picture.

Observational investigations of Cepheids and cluster-type variables by Fath and by Schwarzschild indicated secondary periods in the light variations. Analysis of this material by Schwarzschild indicated that not only the fundamental mode of pulsation but also higher modes or overtones occur in these stars. Analytical solutions for a standard stellar model indicated the nature of the period-density relation which pulsating stars should follow if they pulsate in the first overtone of the fundamental period. Combining his observed mean colours and mean magnitudes of the stars in the cluster Messier 3 with new periods for these stars determined by Martin, Schwarzschild found an observed period-density relation for the shorter period stars which agrees well with the predicted relation. It appears, therefore, that the shorter period cluster-type stars pulsate in the first overtone of the longer observed periods for these stars. This conclusion is of considerable importance for the interpretation of the mechanism of pulsation.

Stellar System.—A survey of the proper motions of stars in the southern hemisphere, based on series of plates obtained at the southern station of the Harvard observatory, has been carried out by Luyten. The first results of this monumental task appeared during 1941, consisting of the proper motions of 28,505 stars between declination $-50°$ and the south pole. When completed, the analysis of Luyten's results will add very materially to our knowledge of stellar motions in our galaxy.

Determination of the distances of galactic star clusters involves considerable uncertainty due to absorption by interstellar matter. Cuffey studied three clusters in the uniformly rich region of the Milky Way in Monoceros and Canis Major and found that both the selective and general absorption in this direction is very small to a distance of 3,300 parsecs. The absence of appreciable absorption to this distance, coupled with the absence of extragalactic nebulae from these star fields, suggest that there must be considerable absorption at greater distances in this direction. This may indicate the existence of a spiral arm containing absorbing clouds and extending to a greater distance than the average radius of our galactic system would suggest.

Prediction of the presence of molecules of CH in interstellar space by McKellar was confirmed by Adams from high dispersion spectra of Zeta Aurigae. He found a number of additional interstellar lines and concluded that the existence of interstellar CH and CN seemed well established.

External Galaxies.—A new investigation of the dimensions and shape of the Andromeda nebula was made by Williams and Hiltner with a new direct-intensity microphotometer designed to trace isophotal contours. This instrument, called an isophotometer, was used to trace isophotal contours from a negative of the nebula obtained by Hubble with the 18-in. Schmidt telescope at Mt. Palomar. Previous measures of the extreme dimensions of the Andromeda nebula by Redman and Shirley gave $267' \times 89'$. Williams and Hiltner find the values $400' \times 91'$. Adopting currently accepted estimates of the distance of the nebula, the real diameter along the major axis must be at least 80,000 light years.

An investigation by Wyse and Mayall of the distribution of mass in the spiral nebulae Messier 31 and 33, based on radial velocity measures made

at varying distances from the centre of each nebula, indicated that the mass in each case is widely spread throughout the system, with very small concentration of mass at the centre. This result contrasts markedly with the high concentration of light near the centre and indicates that there is no apparent relation between mass distribution and the distribution of luminosity. Observations of the rotation of our own galaxy have heretofore been interpreted as indicating a high central concentration of mass. This may be true, but such an interpretation does not necessarily follow from the observations and the distribution of mass in our galaxy may be similar to that found in these two extragalactic spirals.

Athletics: *see* TRACK AND FIELD SPORTS; etc.

Athlone, 1st Earl of (ALEXANDER AUGUSTUS FREDERICK WILLIAM ALFRED GEORGE CAMBRIDGE) (1874–), British statesman, was born April 14 at Kensington palace, the third son of the 1st duke of Teck. Educated at Eton and the royal military college, Sandhurst, he served in Matabeleland, Southern Rhodesia, in 1896 and saw action during the Boer war, receiving the Queen's medal with five clasps. During World War I he was mentioned twice in dispatches, and in 1917 he was created 1st earl of Athlone. He was governor general of the Union of South Africa from 1923 to 1931. In 1931 he was made governor of Windsor castle, in 1932 chancellor of London university and in 1936 grand master of the Order of St. Michael and St. George. In the latter year he was also appointed personal aide-de-camp to the king. He was appointed 16th governor general of Canada April 3, 1940, to succeed the late Lord Tweedsmuir.

Atlantic Charter: *see* DEFENSE, NATIONAL (U.S.): *"The Atlantic Charter"*; ROOSEVELT, FRANKLIN DELANO; UNITED STATES: *Foreign Relations.*

Auchinleck, Sir Claude John Eyre (1884–), British army officer, was born in England, the son of Col. John Claude Auchinleck. He served in India in 1902, and was stationed in Egypt and Mesopotamia during World War I. In 1933 and 1935 he distinguished himself on the northwest Indian frontier in engagements with native tribesmen. In the spring of 1940 he was made commander of the Allied forces in northern Norway. He took Narvik but was forced to evacuate the city when the Allies failed to make additional landings in the south. In the summer of 1940, after the collapse of France, Auchinleck was appointed general officer commanding the English southern command, and he organized the first defenses of England to forestall the threatened German invasion. In Dec. 1940 he returned to India as commander in chief. In July 1941 he was made commander in chief of British middle east armies, succeeding Gen. Sir Archibald Percy Wavell (*q.v.*), who was transferred to Auchinleck's post in India. Auchinleck's armies in Libya, under Gen. Sir Alan Cunningham (*q.v.*), launched an offensive against axis forces Nov. 18, 1941. Auchinleck's plan to cut off axis supplies met with initial successes, but when the British desert armies were temporarily halted, Cunningham was replaced by Gen. Neil Methuen Ritchie (*q.v.*). Thereafter the British drive gathered momentum and Bengasi was captured Dec. 25, 1941.

Austin, Frederick Britten (1885–1941), British author and playwright, was born May 8 at Hackney Downs, England. The day after England declared war on Germany in 1914, Mr. Austin, then a stock exchange clerk, enlisted in the London rifle brigade. He served for 30 months with the British overseas armies and was demobilized in 1919 with the rank of captain. A keen student of military strategy, Austin predicted as far back as 1913 that mechanized armies would displace cavalry and infantry in future wars. This prophecy was made in an early novel, *In Action*, published in 1913. Among his other works are: *The Shaping of Lavinia* (1911); *Battlewrack* (1917); *The Road to Glory* (1935); and *Told in the Market Place* (1935). He died at Weston-super-Mare in Somersetshire on March 12.

Austin, Herbert Austin, 1ST BARON (1866–1941), British motor car manufacturer, was born Nov. 8 at Little Missenden, Buckinghamshire. Educated at Brampton college, he went to Australia where he served an apprenticeship in engineering at a Melbourne factory. He later went to work as a salesman and repairman for a sheep-shearing machine company. He returned to England in 1893, became interested in motor cars—then a pioneer industry—and designed and built his first car in 1895. In 1900 he became manager of a motor car factory and drove his own product, a Wolseley, in a 1,000-mi. endurance rally in the same year. In 1905, he formed the Austin company, which produced 50 cars the first year; by 1914 the plant was turning out 1,000 cars a year. During the war the factory was converted into a munitions plant. In 1922 Austin went back to motor cars and produced the first "Baby Austin." By 1927 the Austin works had turned out 100,000 of the cheap, 7-h.p. cars. Lord Austin gave more than $1,250,000 to the Cavendish Laboratory of Experimental Physics at the University of Cambridge. He was a member of parliament from 1919 to 1924 and was created first Baron Austin in 1936. He died May 23 at Lickey Grange, near Bromsgrove, Worcestershire.

Australia, Commonwealth of. A self-governing member of the British commonwealth of nations, situated in the southern hemisphere between longitudes 113°9′ E. and 153°39′ E. and latitudes 10°41′ S. and 43°39′ S.; national flag, a blue ensign, with the Union flag in the quarter and six white stars in the field. Ruler, King George VI; governor-general, the Rt. Hon. Lord Gowrie, V.C.; prime minister, J. Curtin; language, English; religion, Christian (census 1933: Anglican, 2,565,118; Roman Catholic, 1,161,455; Presbyterian, 713,229; Methodist 684,022; other Christians, 603,914).

Area and Population.—Area, 2,974,581 sq.mi.; population (est. Dec. 31, 1940), 7,068,689. Chief towns (pop. Dec. 31, 1940): Sydney (1,310,520), Melbourne (1,076,000), Adelaide (330,000), Brisbane (335,520), Perth (228,000), Hobart (66,620), Newcastle (116,000). Capital, Canberra.

History.—The political upheavals which were a constant threat to stable government throughout 1941 and which culminated in the downfall of the national government in September must have appeared to be strangely out of harmony with Australia's magnificent war effort to observers unfamiliar with the background of Australian politics. It is important therefore to record that the Labour opposition declared more than once in the most emphatic terms its determination to prosecute the war to its ultimate victory with all the vigour of which the nation was capable. The reason for Labour's persistent refusal to join in an all-party government must be sought in the history of a trade union movement of unbounded vitality and supreme confidence in the ability of the working class movement to undertake all the responsibilities of administration. It regards the United Australia party as representative of the bankers and industrialists and is unshakably convinced that the bankers squeezed the Labour administration out of office during the 1930 depression. It regards the building of an Australian nation, possessed of a standard of life hardly equalled anywhere in the world, as the achievement of a people possessed of initiative and vitality and capable through the Labour movement of leading the nation to victory.

CITIZENS OF SYDNEY borrowed a U.S. custom and threw paper and confetti for the first time March 20, 1941 to welcome the visiting crews of seven U.S. warships

In February, Prime Minister Menzies left Australia for a visit to the United Kingdom, inspecting the Australian imperial forces in the middle east en route. While in England he sat at meetings of the war cabinet, and postponed his departure in order to take part in vital decisions necessitated by the Greek campaign. During his absence A. W. Fadden, elected leader of the Country party in March, became acting prime minister. In March the Child Endowment bill, which had Labour's full support, was passed by both houses. The act provides for the payment of 5*s.* a week for every child after the first, and was estimated to cost £13,000,000 annually. The advisory war council was increased from 8 to 10 in order to permit the Labour nominee, Dr. Evatt, to join the council. Fadden again urged the formation of an all-party government, but the offer was rejected by the Labour caucus in May.

Menzies, after his return by way of the U.S.A., called for a more urgent war effort and announced drastic new measures by the government (see *Economic Affairs*, below) but was unsuccessful in inducing Labour to join the government. After the evacuation of Greece and Crete, there had been a general feeling in Australia that the commonwealth should have a more direct voice in discussions of major policy by the British war cabinet. As the other dominions did not appear to favour the formation of an imperial war cabinet, the most obvious solution was for the commonwealth prime minister to return to London, and that Menzies proposed. The suggestion was opposed, not only by Labour, but by some of Menzies' own party, and revealed the existence within the government ranks of a section who lacked complete confidence in Menzies' leadership. In the interests of national unity Menzies resigned his post in favour of Fadden, who was sworn in as prime minister on Aug. 31. Menzies retained his portfolio as minister for defense co-ordination, and no other cabinet changes were made. The Fadden administration lasted only five weeks. After surviving, by a majority of one, a vote of censure on the use of public funds for subsidizing anti-subversive propaganda, the government was defeated on its budget proposals by a majority of three, the two Independent members voting with the opposition. Fadden advised the governor-general to call upon Curtin, the Labour leader, to form a government and pledged the support of his followers so long as the new government vigorously prosecuted the war. Curtin announced that the change of government would not affect any diplomatic appointments and authorized Sir Earle Page, who was on his way to London, to continue his mission.

External Affairs.—Sir Bertram Stevens, former premier of New South Wales, was appointed Australian representative of the eastern supply group, Delhi, in Jan. 1941. In July, Sir Frederic Eggleston was appointed Australian minister to China and took up his post at Chungking.

Economic Affairs.—On his return from the United Kingdom and America, Menzies announced his "prospectus of an unlimited war effort." This program involved drastic control by the government of finance, trade and industry. The government was given powers to take over factories and plants and to decide what each organization should produce; a board was appointed to control and direct the production and distribution of coal. All interstate shipping was placed under government control, and all rail-road transport facilities were made subject to a federal executive body.

Side by side with such measures for the control and direction of the means of production the government had to face drastic changes in agricultural economy necessitated by shipping shortages, particularly of refrigerated space. Plans included the establishment of new secondary industries for the canning of meat, sausages and bacon, and the production of meat concentrates and dried eggs. Cheese and dried milk production had to be increased to replace butter exports. As stated by the minister of commerce (Sir Earle Page): "Our entire agricultural economy is being planned and streamlined to meet the needs of war."

Total war expenditure for the financial year 1940–41 was £181,000,000, of which £11,000,000 was recoverable for services and supplies on behalf of other governments. This compared with the estimate of £186,500,000. Of this sum, £65,000,000 was provided from revenue. The total non-war expenditure from revenue was £85,400,000. Total revenue was £3,000,000 above the estimate. In presenting his budget for 1941–42 on Sept. 20, Fadden (prime minister and treasurer) announced that, despite Lend-Lease aid, expenditure for 1941–42 was estimated at £217,000,000, of which £160,000,000 would be expended in Australia. Expenditure on all

services other than war was estimated at £102,300,000. After providing for non-war services, only £63,000,000 was available from revenue for the war cost of £217,000,000. The treasurer proposed to borrow £122,000,000 from the public and banking system and to raise £32,000,000 by new taxation and wartime contribution, which involved a system of compulsory savings to be levied on every income. However, the government was defeated on its budget proposals and at the close of the year it remained to be seen how the new treasurer, J. B. Chifley, proposed to meet the gap between revenue and proposed expenditure.

Education.—In 1937: state schools, 10,205; average attendance, 768,848; private schools, 1,880; average attendance, 210,101; technical education, net enrolments, 102,496; business colleges, average attendance, 21,139; universities, number of students, 11,098.

Defense.—The year 1941 witnessed for the most part the development, intensification and extension of plans which had been prepared during the earlier months of the war. In addition to maintaining reinforcements of men and material for the Australian imperial forces in the middle east, a large contingent was dispatched to Singapore in February for service at various stations in the Malay peninsula. Further contingents arrived there in August and October.

In January the government announced its intention to raise and equip an armoured division, fully equipped with tanks and more than 1,000 other armoured vehicles, and with a personnel of more than 10,000 officers and men. Training was proceeding at the end of the year.

A 3rd Forestry company arrived in England in July to join the two companies which had been sent there for service during the previous year.

The Australian imperial forces played a prominent and valorous part in the campaigns in Greece, Crete, Libya and Syria. According to revised records received from General Blamey in June the Australian casualties in Greece and Crete numbered 261 officers and 5,690 men. Seven medical officers and 150 other ranks voluntarily stayed behind in Greece to care for the wounded.

Lieut.-Gen. Sir Thomas Blamey, general officer commanding the Australian imperial forces, middle east, was appointed deputy commander in chief, middle east, in April and was promoted to the rank of general in September.

Because of the increased tension in the Pacific, the government plans for the building of a fully-trained home army of 250,000 were accelerated. In February, the army minister announced that military camps would be extended from 70 to 90 days and that in the future more than half of the total personnel of the military forces would be in camp.

The government decided to appoint a commander of home forces, and in August General Sir Iven Mackay was recalled from the middle east to take over this command. It was estimated that at the end of the year the strength of the Australian imperial forces stood at 200,000 and the total armed forces in the commonwealth at more than 250,000.

In March, Vice-Admiral Sir Guy Royle was appointed chief of the Australian naval staff in succession to Admiral Sir Ragnar Colvin.

The training of air personnel for the expanding royal Australian air force and for the empire air training scheme proceeded ahead of schedule. Most of the advanced training was being completed in Australia in 1941 instead of in Canada as originally planned. The first personnel to complete their training in Canada arrived in the United Kingdom on Christmas day 1940, and the first contingent of those who completed their training in Australia arrived in Feb. 1941. From that date they were arriving in ever-increasing numbers almost weekly. By October, 205,000 volunteers had enlisted in the R.A.A.F. and for the empire air training scheme and more than 50,000 had been selected for training. In June the government decided to form an R.A.A.F. cadet corps to consist of 78 squadrons, which was to provide for the training of 20,000 boys between 16 and 18.

In spite of the drain of man-power necessitated by the maintenance of military forces, remarkable developments in the industrial sphere of war production were achieved. Before the war there were only five manufacturers of machine tools in the commonwealth; in 1941, 85 firms were engaged in producing all classes of jigs and precision tools. Besides ammunition of all kinds, Australia in 1941 produced hand grenades, aircraft bombs, naval mines and gun forgings and manufactured guns and engines for the royal navy. Anti-aircraft guns, Bren guns and 25-pounder howitzers were being turned out in increasing quantities. One thousand Australian-produced aircraft were actually in service by October. Among the many naval vessels launched from Australian shipyards during the year was included H.M.I.S. "Punjab" for the Indian navy.

Banking and Finance.—Revenue (actual 1940–41), £A150,500,000; (est. 1941–42) £A195,000,000; expenditure (actual 1940–41) £A150,500,000; ordinary (est. 1941–42), £A102,306,000; defense, £A95,000,000; public debt (June 30, 1941), £A1,426,000,000; notes issued (July 7, 1941), £A67,000,000; gold and sterling reserve (Dec. 31, 1940), £A17,705,000; exchange rate, £A125=£100 sterling.

Trade and Communications.—Overseas trade 1940–41 (merchandise): imports, £A136,300,000; exports, £A136,400,000; (bullion and specie 1938–39): imports, £A3,562,000; exports, £A18,963,000. Communications and transport: 1939, roads, total mileage, *c.* 500,000; metalled, *c.* 200,000 mi.; railways open to traffic, 27,961 mi.; airways (1939–40), distance flown, 12,822,751 mi.; passengers carried, 142,797; goods carried, 1,770,738 lb.; mails carried, 416,996 lb.; shipping with cargo and in ballast, in net tons, entered (monthly average 1938–39), 558,000; (monthly average 1939–40), 508,000; cleared (monthly average 1938–39), 553,000; (monthly average 1939–40) 502,000; motor vehicle registrations (March 31, 1941): cars, 548,451; commercial vehicles, 263,219; cycles, 72,923; wireless receiving set licences, 1,282,787; telephones, number of lines, 520,037.

Agriculture, Manufacturing, Mineral Production.—Production (in metric tons): wheat (1940–41), 2,286,000; gold (1939), 51,187 km.; wool (1940), 512,800; cane sugar (1939–40), 943,000; coal (1939), 12,438,000; lignite (1939), 3,720,000; iron ore (metal content) (1938), 2,287,000; pig iron and ferro-alloys (1938), 945,000; wine (1938–39), 680,000 hectolitres; oats (1938–39), 282,000; barley (1938–39), 245,000; maize (1938–39), 179,000; potatoes (1938–39), 278,000; butter (1939–40), 216,900; lead (smelter production) (1939), 185,000; zinc (smelter production) (1938), 70,000; copper (smelter production) (1938), 17,400; tungsten ore (1938), 540; antimony ore (1938), 900; silver (1939), 385. Labour and employment: employment in factories (1928–29=100) March 1941, 151.5; number (average March 1941), 654,500; unemployment, trade union returns (March, 1941), 5.3%; recorded material production (1938–39), £A464,993,000. (W. D. Ma).

Automobile Racing.

Once again the annual Memorial Day 500-mile Indianapolis classic was the high light event of the auto racing featured during 1941. This time it was particularly noteworthy because two drivers shared the distinction of piloting the winning car. While 160,000 enthralled spectators watched, probably the largest crowd ever lured to the event, Mauri Rose of Indianapolis and Floyd Davis of Springfield, Ill., successfully combined their skill and courage to achieve the victory. They drove their car at a speed of 115.117 miles per hour over the 500-mile distance to share first prize money, totalling $29,985. They are listed in the record books as co-winners.

Davis, famed dirt track contestant, started the race in the winning machine owned by Lou Moore, retired Indianapolis driver. Rose, one of the most consistent finishers in speedway competition, relieved Davis at 177½ miles after Rose's own car, of which Moore was the manager, was forced out at the 152-mile mark by carburettor trouble.

Fifteen of the thirty-one starters, comprising the fixture's smallest field since 1936, completed the race. The runner-up for the second successive year was Rex Mays of Glendale, Calif., who was more than two and one-half miles behind Rose at the end.

Harley Taylor of Atlanta, Ga., set a record for 50 miles in a stock car on a dirt track by doing 100 laps on the half-mile Southern States fair grounds track at Charlotte, N.C., in 59.54.3. Ray Hall of the same city, won the 200-mile stock car auto race at the Langhorne, Pa., speedway, averaging 69 miles per hour.

The midget automobile racing tracks again proved popular centres of entertainment for thousands of fans in numerous cities and towns.

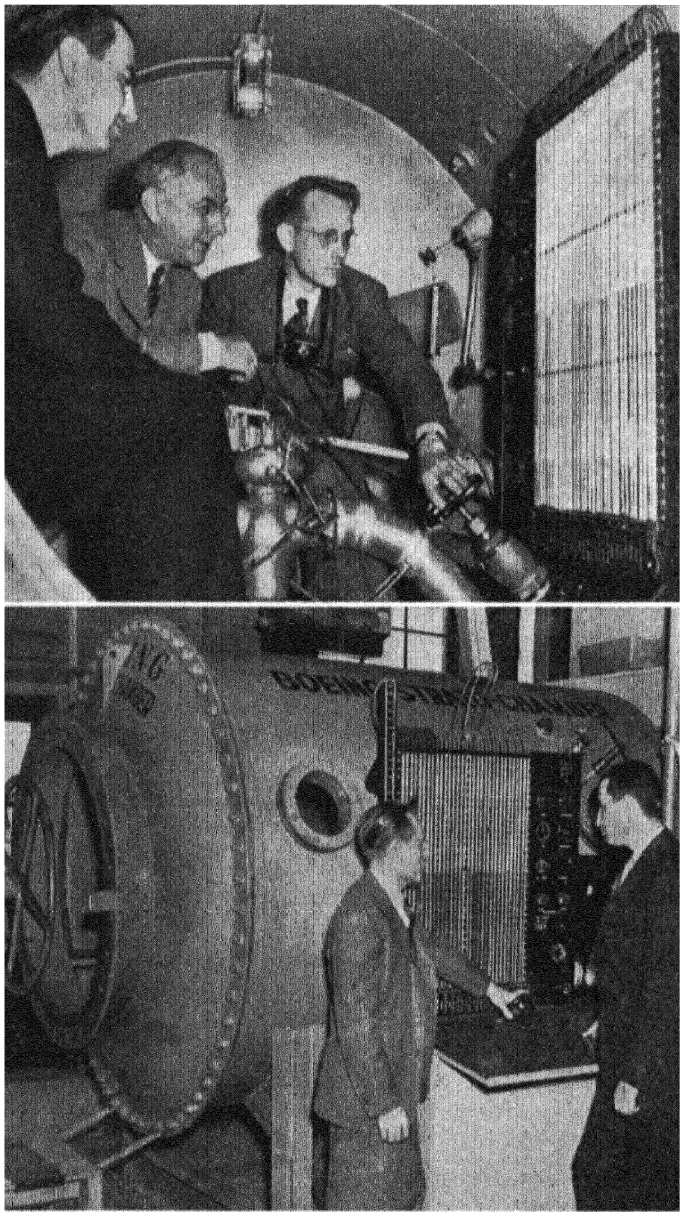
Among the leaders of feature events in the midget class was Mike Joseph who set a new record for 20 laps at the New York coliseum in 3.37.42. Another winner was Lloyd Christofer of Miami, Fla., who won the Union, N.J., 25-lap midget feature in 5.47.85.

Foremost among those involved in accidents was Wilbur Shaw of Indianapolis, victor in 1937, 1939 and 1940. Seeking to become the lone four-time winner, Shaw was leading when he crashed into the wall at the 300-mile mark. The noted pilot escaped serious injury.

Mays, with his second at Indianapolis and firsts at Milwaukee, Wis., and Syracuse, N.Y., retained the American Automobile association national point championship. He was credited with 1,225 tallies. (T. J. D.)

Aviation, Civil.

With the exception of activities in North and South America, and a few international air lines such as Pan American Airways and K.L.M., civil aviation continued to diminish in 1941 from previous years. In nations



A STEEL "strato-chamber" demonstrated in 1941 reproduces conditions of high-altitude flights. The upper picture shows a test being conducted inside the chamber, which simulates the interior of a high-flying plane and is equipped with air pumps, recording instruments, pressure controls and a dry-ice refrigerating plant. Below is an exterior view of the three-ton laboratory tank

at war, military aviation completely dominated all phases of what had previously been civil aviation.

International Transport.—With the war spreading to new countries, some air transport routes died a quick death, while others, just as suddenly, made their appearance for the first time. As the theatre of war shifted from one stage to another, so did air transport systems change their routes and terminals.

The outstanding name in international air transport in 1941 was that of Pan American Airways. In addition to flying its previously established routes through Mexico, Central and South America, to Alaska, and across both the Atlantic and Pacific, Pan American, at the request of both U.S. and British governments, established a new route across the South Atlantic to several cities in the interior of Africa. As the year closed routes were extended across Africa, the Indian ocean and Burma to China.

On Aug. 18, after his meeting at sea with Prime Minister Churchill, President Roosevelt announced that Pan American Airways would shortly begin operations of a new air line between the U.S. and Africa. In less than three months the new line was in operation. Planes flew from Miami, Fla., down the east coast of South America to either Trinidad or Natal, Brazil, and across the South Atlantic to various bases on the west coast of Africa and thence to Khartoum, Cairo and other African cities. It is this route which was extended to connect with Singapore and other points in that general area after the U.S. entered the war in Dec. 1941.

The U.S.-New Zealand route was kept open after war began, but the Pacific service beyond the Hawaiian Islands to the Philippines and China was discontinued.

Until the outbreak of war, Pan American's Atlantic service was one of the most outstanding jobs ever done by any commercial air line. In December the 500th crossing was made since the line was inaugurated in May 1939. During 1941 passenger miles flown on this route increased from 13,000,000 in 1940 to 23,600,000. Miles flown had jumped to 1,200,000 from 500,000 in 1940. This route had become the only fast scheduled run in operation, as the sailing of steamships was irregular.

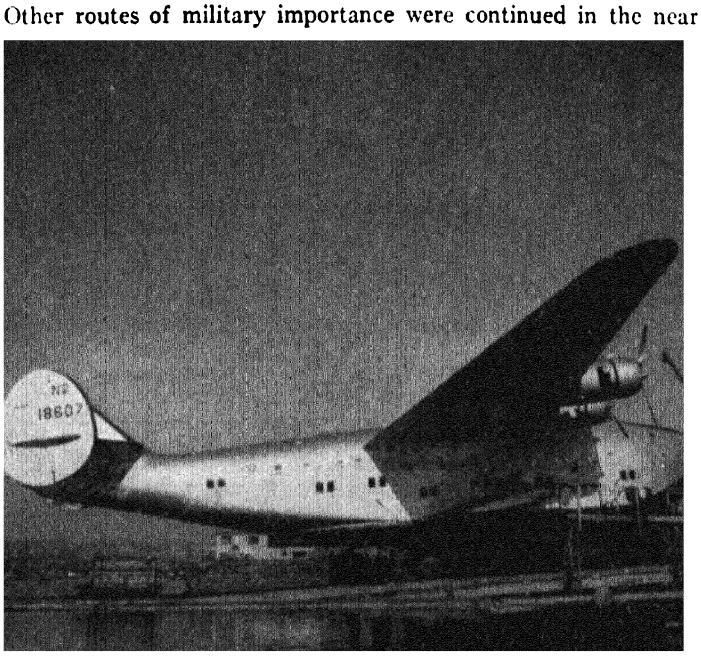
In Central and South America Pan American's activities also increased. Miles flown were 5,815,000 compared with 4,019,074 in 1940. Passengers carried increased from 89,650 to 107,580. There was a 63% increase in air express carried, from 579,000 to 950,000 lb.

The Brownsville-Guatemala-Canal Zone-Trinidad trunk line was placed on a daily basis and passenger traffic increased 20% and express volume more than doubled. Pan American-Grace activities along the west coast of South America were enlarged by the addition of approximately 50% more mileage. Panagra's 1941 operations included 2,267,000 revenue passenger miles, compared with 1,530,000 in 1940; mail carried was 157,000 lb., compared with 112,000 the year before; revenue passengers carried were 29,600, compared with 14,660 in 1940; express of 466,000 lb. compared with 170,000 in 1940.

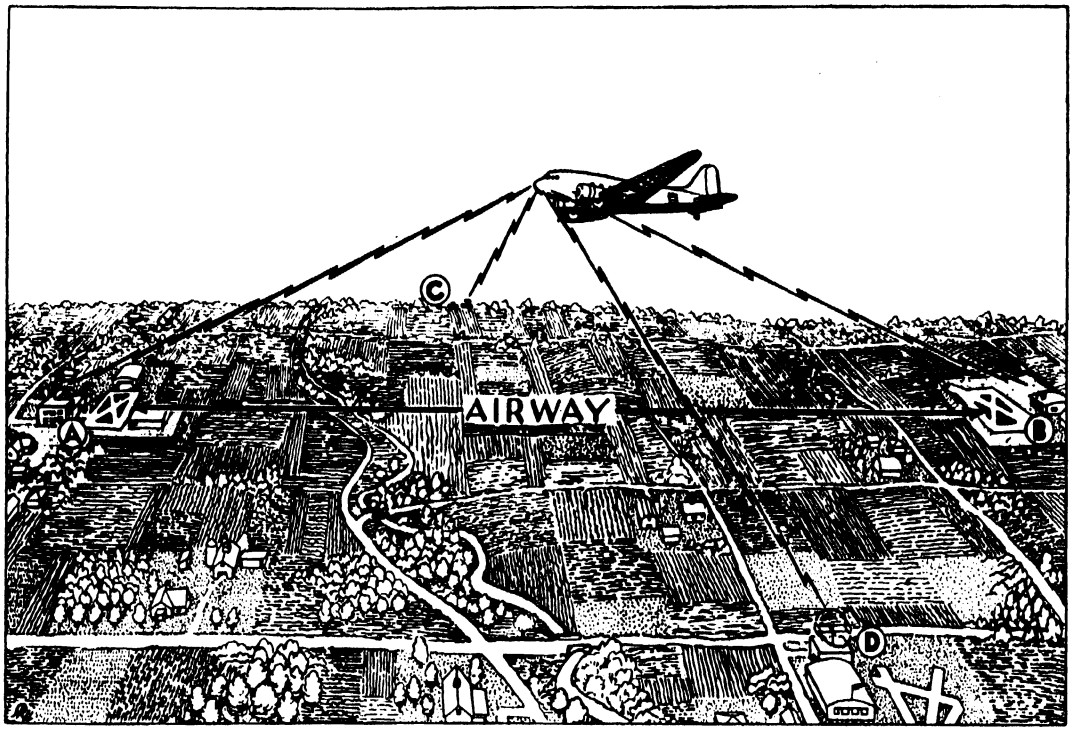
The air line took over the operations of several former German and Italian lines in South America and also carried out a huge airport building program, particularly along the east coast.

Service across the Pacific and the route from the U.S. to Alaska operated at new highs in 1941. Both services played a critical role in carrying military and important civilian personnel to strategic spots.

British Overseas Airways continued to operate a number of its international routes. During 1941 some 4,000 passengers were carried between England and Lisbon, plus 13,500,000 letters. Other routes of military importance were continued in the near



THE FIRST OF A FLEET of larger and improved Boeing clippers for transatlantic flights was launched March 17, 1941 at Seattle, Washington



AN AUTOMATIC DIRECTION FINDER installed on airways in 1941 enables ground personnel to "spot" the exact position of a plane in flight. When the pilot uses his microphone, a compass reading of his plane is recorded automatically at four stations (A, B, C and D in the diagram). Any two of these stations can then determine by triangulation the plane's position

east as well as the far east. The line purchased three Boeing clippers from Pan American Airways which were used for special missions. It was one of these large flying boats that was used to carry Prime Minister Churchill back to England after he visited the United States and Canada.

The Royal Dutch Airline, known as K.L.M., together with its affiliate K.N.I.L.M., continued to render yeoman service to the Allied cause. One branch of the line ran between England and Portugal. A twice-weekly service was run between Lydda, Palestine, and Sydney, Australia. Stops were made at Baghdad, Basra, Bahrein, Karachi, Jodhpur, Calcutta, Rangoon, Medan, Singapore and Batavia. From Batavia, the operating centre, the route continued on to Australia with stops at Surabaya, Bali, and Timor. Other important routes connected Batavia with Balikpapan and Tarakan, as well as with other cities among the islands. How much of its routes would be flown in 1942 depended on the spread of the war. With pilots from the Netherlands East Indies air force winning praise for their gallant deeds, it should be added that their brother pilots flying commercial transports were also doing admirable work for the Allies.

German Lufthansa flew fewer schedules in 1941 than in the preceding year. The German air transport system received a setback from the Russian campaign from which it had not recovered at the close of 1941. With shortages in both men and materials developing, fewer commercial passengers were carried on its air lines. Domestic routes continued to be flown, as well as the international runs to Sweden, France, Spain and Italy. Few figures were available. German lines in South America were taken over by either local countries or by Pan American Airways.

Air France flew a few local routes in 1941 as did Sweden. Italian planes flew commercial passengers to Lisbon, but elsewhere the military authorities occupied most of the space. In Finland, Hungary and Rumania air transport was strictly a military affair. Russian commercial transport continued to function although a high priority was given to passengers travelling for military or defense purposes.

In China, the China National Aviation corporation, jointly owned by the government and by Pan American Airways, carried on its work under the most difficult conditions. With the advance of the Japanese forces, the C.N.A.C. operating and maintenance base was moved on several occasions. The pilots, largely American, won great praise for their cool work in evacuating key military and civilian personnel from dangerous areas.

In Canada, Trans-Canada Air Lines had its most active year. Some 118 miles of new routes were added between Moncton and the great air base at Halifax. New runs were also added on several routes, including Toronto-New York. At the beginning of 1941 the line operated 15,000 miles per day, but by the end of the year it was operating 19,000 miles per day. The number of passengers carried per month doubled during the year; mail increased from about 83,000 lb. per month to 140,000 lb. and air express almost trebled. The line anticipated services to both Newfoundland and Alaska in the near future.

Domestic Air Transport in the U.S.—With increased preparations for war taking place throughout 1941, commercial air lines were the busiest in their history. Approximately 4,500,000 passengers were carried as compared with 3,185,278 in 1940. Distances flown increased from 119,517,263 miles in 1940 to about 150,000,000 miles in 1941. The fatality rate per 100,000,000 passenger miles declined from 3·05 in 1940 to 2·20.

Air express increased from 14,188,178 lb. in 1940 to more than 22,500,000 lb. in 1941. Air mail totalled 45,450,000 lb. compared with 33,800,000 in 1940. Profits were stated to be the best in history for most domestic air lines.

Many new routes were asked for by the air lines, but relatively few were approved by the Civil Aeronautics administration. After war had been declared CAA advised that no new routes would be approved unless they were clearly of value to national defense.

During 1941 there was a shortage of aeroplanes on nearly every U.S. air line. With steadily growing traffic, the lines had ordered relatively large numbers of new aeroplanes for 1941. Army and navy priorities on transports of approximately the same type kept the air lines from getting their ships. As a result, it was necessary for the lines to practise intensive maintenance to keep their transports flying. Formerly much maintenance was done in the daytime with spare aeroplanes. Since the heaviest schedules are flown in the daytime, it became necessary to do considerable maintenance work at night. However, maintenance standards did not decrease and safety records actually improved.

For the year 1942 the domestic air lines were allotted 112 aeroplanes. It seemed probable that most of these would be delivered to the lines, since the lines were an adjunct of the war machine. In carrying key personnel of both the government and defense industries, the air lines performed a valuable service. In World War I if an important governmental official had wanted to travel from New York to San Francisco the trip would have required at least five days. In 1941 he could have done it overnight, thanks to the commercial air lines.

The air lines were still ostensibly under the Civil Aeronautics

administration. Actually CAA was controlled by a general of the war department. Air transports might be commandeered for army duty at a moment's notice. It was expected that space on transports would be controlled, with a priority being given to military personnel and persons holding important government and defense jobs.

Civilian Flying in the U.S.—"The year 1941 was the greatest in the history of American aviation," stated Robert H. Hinckley, assistant secretary of commerce for air. The nation's civilian pilot roster passed the 100,000 mark, an increase of 60% over the 1940 figure of 63,113. The growth was accounted for largely by the training program of the Civilian Aeronautics administration. By the end of the year the army and navy were getting about one-third of their flying cadets from the ranks of CAA trainees. In addition about 2,800 CAA instructors joined defense units in the U.S. and Canada. A new program of training 3,200 instructors was under way.

During 1941, 30,000 young men completed elementary courses, with 9,800 still in training at the end of the year. Some 6,000 pilots passed the secondary course, and 3,000 were still in training. Instructor and refresher courses were given to 6,000 pilots. There were approximately 550 ground schools and 600 flight schools operating.

The number of certificated civil aircraft increased from 17,500 to approximately 27,500 during 1941. A large part of this gain was accounted for by training planes used in the CAA program. "Certificated" planes included all those registered with the government but did not include military planes or experimental models.

Up until the time war was declared by the U.S. the private pilot in the U.S. had the greatest of freedom. On the day following the declaration of war all private and commercial licences, except those of air-line pilots, were cancelled. Then re-licensing was resumed but noncitizens and Japanese were forbidden to fly. Flying was also greatly restricted in a zone extending 150 miles from both the east and west coasts, from Canada to the southern border. If a pilot wished to fly more than 10 miles from his home airport he had to file a flight plan with the army and have it approved. Any flying over certain zones was prohibited.

The civil air patrol was formed late in the year. Approved by CAA and by pilots' organizations, it provided for various phases of air activity by civilian pilots. Some indications pointed to the possibility that all civilian flying might be done under its jurisdiction.

Production of Civil Planes.—In 1941 approximately 8,000 aeroplanes were built in the United States for civil purposes. This number was the greatest in history and compares with 6,748 in 1940.

Technical Developments.—In the light plane field there were few changes in design over 1940 models. A few new aeroplanes were introduced, one of the most prominent of which was the General Aircraft corporation's "Skyfairer." This was a two-control aeroplane, having only ailerons and elevator, but no rudder. It had a tricycle landing gear and was both spinproof and stallproof. It more nearly approached a "foolproof" aeroplane than any other designed in the U.S. Originally designed as an all-metal aeroplane, its producers were forced to re-design it for wood and fabric.

The few that were built attracted considerable favourable attention.

Another new aeroplane was the Langley plane, with two 65- or two 75-h.p. engines and a cabin seating four. Most interesting feature of the plane was its plastic-bonded plywood construction. Both fuselage and wings were entirely of plywood.

There were three large aeroplanes under construction of interest to the air lines. The Vought-Sikorsky VS-44A flying boats for American Export Airlines attracted much attention as the first was launched just after the end of 1941. These were 4-engined flying boats that could carry 40 passengers, including a crew. Speed was about 200 m.p.h. for cruising and the range was 3,000 miles. Maximum nonstop range under special fuel and load conditions was 6,000 miles. The hull was 80 ft. in length and the wing span was 124 ft. Engines were 1,200-h.p. Pratt & Whitney.

Another new aeroplane announced during 1941 was the Lockheed Constellation, developed by Lockheed for TWA and Pan American Airways. The first ships were begun but not finished in 1941. This was a 57-passenger land plane, powered with four 2,500-h.p. engines, which would boast the phenomenal speed of 350 m.p.h. Cruising speed was expected to be about 283 m.p.h. This would bring Los Angeles within 8½ hours of New York. The cabin and engines were supercharged. The first of this new type should be test flown in 1942.

Several of the Douglas DC-4 aeroplanes were under construction in 1941. The original DC-4 was designed around the specifications of several U.S. air lines, but when the prototype was completed it was not what the lines wanted. The original was flown for several months in the U.S. and then sold to Japan. The new DC-4 was a smaller aeroplane, although still powered with four engines. The ships under construction in 1941, although designed for air-line use, were expected to be taken over by the army for transport work.

In the field of engines considerable technical developments were made but the newest engines were being used in military planes and progress cannot be discussed. These developments were expected to lead directly to improved commercial engines both during and after the war. The development of the turbo-supercharger, for example, used on high-flying fighters and bombers, would also be a valuable addition to pressurized transport ships of the future. Avila Camacho, Manuel (1897–), president of Mexico, was born at Teziutlan in the state of Puebla on April 24. After completing a course of commercial studies in his native town, he joined the successful revolution against Victoriano Huerta in 1914 and was promoted through various grades in the army to the rank of general of division. In the cabinet of President Rodriguez he was minister of war and navy. President Cárdenas later appointed him secretary of national defense and personally selected him as successor to the presidency. He was elected president July 7, 1940, by 2,476,641 votes to 151,101 for his opponent, Gen. Juan Andreu Almazán, according to tabulations of the Mexican congress. The new president was inaugurated Dec. 1, 1940.

In 1941, the first full year of Avila Camacho's presidency, there was unusual political quiet and harmony in Mexico. The chief untoward incident occurred Sept. 23, when troops fired into a crowd of munitions workers demonstrating before Avila Camacho's home in protest against labour conditions. During 1941, he negotiated a settlement of the oil-expropriation controversy with the United States. He consistently stressed hemispheric solidarity in defense and on Sept. 1, 1941, pledged the Mexican armed forces to that end. He added, however, that his country's great desire was to stay out of the war. (*See* also MEXICO.)

Azores, The: *see* PORTUGUESE COLONIAL EMPIRE.

Bacon. Although the production of almost all widely used food products increased in the United States in 1941, the output of bacon decreased. Sliced bacon, which had grown steadily in popularity for several years, was lower by approximately 500,000 lb. than in 1940. The output of government-inspected sliced bacon in the first 11 months of 1941 was 292,201,165 lb. compared with 292,780,137 lb. in 1940. In contrast, restrictions in consumption of bacon and other pork products continued in Canada in order that the dominion might maintain its shipments of bacon, ham and pork cuts to Great Britain. American-type bacon, unlike other United States meat products, never achieved popularity outside the U.S., and there was little demand for it to be included in the huge lend-lease shipments of food to Great Britain. Canada, at the end of the first two so-called "bacon agreements," Nov. 1939 to Oct. 1941, had shipped 756,000,000 lb. of bacon, ham and pork cuts to the United Kingdom and was to ship 600,000,000 lb. more in 1942. Other U.S. meat products were in demand for export, and a total of 1,014,846,403 lb. of canned meats and meat products was produced in the first 11 months of 1941, compared with 661,474,977 lb. in the first 11 months in 1940. Canned pork constituted 396,762,028 lb. of this output in 1941 and 251,096,103 lb. in 1940. Canned meat loaves, head cheese and chili con carne made up 130,132,859 lb. of the production in 1941 and 110,294,541 lb. in 1940.

Bacteriology. The spread of infectious agents through by droplet infection was given study in 1(The possibility of sterilizing air has been attempted by irra tion with ultraviolet light and by means of germicidal m or aerosols. The theoretical basis for the high bacterial ac ity is accounted for by the small quantity of germicidal ag which may be dispersed through a large enclosed air space. ' because each droplet of the aerosol contains the same concen tion of effective chemical substance as does the parent solut the bactericidal agent is enabled to act in high concentrat on bacteria suspended in the air. One part by weight of pro ene glycol in 2,000,000 volumes of air effected complete s ilization of an atmosphere containing as many as 200,000 b teria per cubic litre of air within a few seconds. Pneumoc types I and III, haemolytic streptococci, haemolytic staphyloco *Streptococcus viridans, Bacterium coli* and *Micrococcus catarr lis* have been tested and found to react similarly.

Influenza is caused by infectious agents (filterable virus which pass through filters that screen out bacteria. There apparently many separate viruses which may cause the same t of symptoms and the alphabet is used to designate them. T there have been described influenza A virus and influenza B vir A new strain of the virus of influenza B has been isolated fr the throat washing of a case of influenza during an epidemic California. Attempts to immunize large groups of people in stitutions with influenza A virus have been made using a vacc prepared from chick embryos inoculated with both influenza A rus and canine distemper virus. In volunteers who had receiv a single subcutaneous injection of complex vaccine of good ar genic potency four months previously, the incidence of influer A during an epidemic was 50% lower than among unvaccinat individuals in identical environmental circumstances. The in dence of influenza of unknown cause was not significantly diff ent in the two groups.

Microorganisms have been isolated which possess the power preventing the growth of or killing other bacteria. One of the microorganisms is *Actinomyces antibioticus*, which was isolat from the soil. Two active substances have been isolated in cry talline form from this microorganism, one which prevents bacte from growing whereas the other kills them. These substances a poisonous to animals when injected intravenously, intraperiton ally or intramuscularly.

The western strain of virus which causes sleeping sickness horses and man was isolated in a naturally infected prair chicken. This constitutes the first time that this virus has be reported in a host other than man and horses, coincidental wi a human epidemic in time and place.

Spotted Fever.—The popular conception that Rocky mounta spotted fever is a more virulent and, therefore, a more high fatal disease in the west than in the east was shown not to b true. One reason which was thought to account for this differen was that the wood tick, *Dermacentor andersoni*, carried the vir lent western virus whereas the dog tick, *Dermacentor variabili* which is common in the east, was held responsible for carryin the strain of lesser virulence. During 1941 some doubt was ca upon this theory since a highly pathogenic strain of Rocky mou tain spotted fever was isolated in *D. variabilis* territory in th east from which *D. andersoni* had never been reported. Also strain of very low virulence was recovered from a patient wh acquired the tick in *D. andersoni* territory in the west, from whic *D. variabilis* had never been reported. (*See* also EPIDEMICS AN PUBLIC HEALTH CONTROL.) (G. M. DA.)

Baden-Powell, Robert Stephenson Smyth Baden-Powell,

1ST BARON (1857-1941), British army general, naturalist, actor, writer, sculptor and founder of the Boy Scout movement, was born Feb. 22 in London. A tireless traveller, he visited the United States on three occasions—in 1912, 1930 and 1935—and knew Africa as well as he did his native England. In 1937 ill-health forced him to abandon his active life in London and he returned to Africa to spend his last days. Some of his later works, several of which he illustrated, were: *Scouting and Youth Movements* (1929); *Lessons from the 'Varsity of Life* (1933); *Adventures and Accidents* (1934); *African Adventure* (1936); *Birds and Beasts in Africa; Life's Snags; Scouting for Boys; Girl Guiding; Official Handbook* (1938); and *More Sketches of Kenya* (1940). He died Jan. 8 at Nyeri, his home in Kenya colony, and was buried on the slopes of nearby Mount Kenya. (See *Encyclopædia Britannica.*)

Badminton.

Badminton's leading man continued to be David Freeman, of Pasadena, Calif., who retained the men's national championship for the third successive year. Freeman, a 20-year-old student at Pomona college, Calif., was formerly a tennis player of international note. He defeated Carl Loveday, of Montclair, N.J., for national honours, although the latter won the Metropolitan (New York), eastern and New England titles.

Miss Thelma Kingsbury, former English women's champion, became the women's national badminton titlist, defeating Miss Evelyn Boldrick, of San Diego, Calif. Freeman and Miss Kingsbury won the mixed doubles titles. Freeman and Chester Goss, also of Pasadena, and Miss Kingsbury with Miss Janet Wright, of Oakland, Calif., made a clean sweep by winning the doubles championships. Miss Mary Hagan won the Metropolitan and eastern titles.

Central "Y" won the men's class-A team title of the Metropolitan Badminton association. Spencer Davis, a Princeton sophomore at the time of his victory, captured the eastern intercollegiate title. (J. B. P.)

Baer, William Jacob

(1860-1941), U.S. miniature painter, was born Jan. 29 in Cincinnati, Ohio. One of the founders of the American Society of Miniature Painters, Baer became an associate member of the National academy in 1913. Many of his miniatures are in private collections in the United States and Europe. He died in East Orange, N.J., Sept. 21. (See *Encyclopædia Britannica.*)

Bagby, Albert Morris

(1859-1941), U.S. pianist and originator of the Bagby morning musicales in New York city, was born April 29 in Rushville, Ill. In his youth he studied music under Franz Liszt at Weimar, and he wrote many articles on the Hungarian composer. Urged by New York society women to organize his own subscription-musicales, Bagby in 1891 started his Monday morning musicales at his studio. He had such success that in later years he moved to quarters which could accommodate as many as 1,800. Bagby died in New York city, Feb. 26.

Bahamas.

A British colony and island group lying east and southeast of Florida, with an appointed governor and legislative council and an elected assembly. Area: 4,375 sq.mi.; pop. (1939 official est.): 67,729 (1931 census: 59,828); capital: Nassau (pop. 19,756); governor: H.R.H. the duke of Windsor.

History.—Bahamian development during 1941 centred primarily about World War II and issues affected by it. Extensive gifts in metals, money and foodstuffs were made to the empire cause, along with a loan of £100,000 free of interest for the duration of the war. Under war conditions the colony experienced serious difficulties in the maintenance of regularly scheduled shipping connections with the United States; nevertheless, the tourist trade boomed. In September the United States naval and air base on Great Exuma Island was formally taken over by that country, although construction was not yet complete.

THE DUKE OF WINDSOR, governor of the Bahamas, and the duchess greeting crowds in Chicago as they were en route to their ranch at Calgary, Canada in Sept. 1941

Education.—Education is compulsory. In 1939 there were 64 government schools, with 10,376 enrolment; 56 "aided schools," with 3,021; an industrial school with 103 pupils; and 49 denominational and private schools with 2,710. A government high school and three denominational schools provide secondary education.

Finance.—The monetary unit is the pound sterling (about $4.03½). The colony's public debt as of Dec. 31, 1939, was £253,000.

Trade.—In 1940 imports were £1,284,417 in value, exports £229,140, compared with £1,094,170 and £180,281, respectively, in 1939. The expansion of external trade continued in 1941 with 33% more imports and more than 50% more exports during the first three months than in the corresponding period of 1940. Imports are almost entirely manufactured goods and foodstuffs, normally coming from the United States, Great Britain and Canada. Exports are fresh vegetables, especially tomatoes (almost entirely to Canada), timber, shell and strawwork and marine produce. Shell and strawwork exports in 1940 totalled £25,569, a 150% increase over 1939. Lumber, however, declined, as did the small sisal industry. A heavy crop of 130,000 lugs of tomatoes was exported to Canada in 1940, and a larger export was unofficially estimated for 1941. The sponge industry, formerly important, was suspended by government order until the end of 1943. The unbalance between imports and exports was offset by tourist expenditures and continued external (United States, Canadian and British) investment in real estate. The 1940-41 season was reported the best since 1937, "if not the best ever." The various export commodities, vegetable produce and fish, are the principal products.

Communication is by air, with five flights weekly from Miami, Fla., to Nassau, and by steamer. A new 700-ac. airport located three miles from Nassau was formally opened Jan. 8, 1941. (*See* also WEST INDIES, BRITISH.)

Baltimore. Seventh largest city of the United States, Baltimore, Md., had a population of 859,100 by the federal census of 1940. Area, 78·58 sq.mi., plus 13·35 sq.mi. of water. The white population in 1940 was 692,533; non-white, 166,567. Mayor (Jan. 1, 1942), Howard W. Jackson.

Mayor Jackson had held office in 1941 for four terms, three of which had been served consecutively since 1931; comptroller, R. Walter Graham; president of city council, Richard C. O'Connell; all elected in 1939 for terms expiring in 1943. No elections were held during 1941. The new municipal airport, opened Nov. 16, 1941, compared favourably with modern U.S. airports with its new-type control towers and its airport and seaplane base facilities. Motor traffic control became an outstanding problem in 1941 with increased defense activity. New parking and driving regulations were promulgated after an extensive survey. Defense road construction called for an outlay of more than $13,500,000. During 1941 Edmondson avenue was extended to the city line by a dual highway, and a cutoff was being built from the Philadelphia road to the Glenn L. Martin aviation plant.

Because of a decrease in city expenses of $16,481 from tax levy funds, plus a decrease in the debt service and an increase of some $94,000,000 in the taxable basis, a reduction of 20 cents per $100 was possible in the tax rate for 1942.

Maryland firms, located mainly in the Baltimore industrial area, had received national defense contracts in excess of $1,000,000,000, or approximately one-tenth of all contracts, by the latter part of 1941. The Glenn L. Martin aeroplane plant and the Bethlehem Steel company expected an increase of 50,000 employees over the 1939 lists. Building and engineering contract awards in the area were $108,442,000 for the first 11 months of 1941. All important business indexes were above 1940 except vessel arrivals and the value of exports. (C. B. S.)

Bananas. Lack of shipping, hurricanes and plant disease contributed severe handicaps to the banana trade in 1941. In the British West Indies the British government made arrangements to pay a subsidy on 12,000,000 stems produced in the year ending Nov. 1, 1941 (the government had stopped shipments of bananas to the United Kingdom in Nov. 1940). The guarantee was later extended to cover 14,500,000 stems, the crop produced in 1941. Because of shipping restrictions, the British West Indies exported only 4,287,742 stems in 1941 and only 4,358,425 in 1940. The hurricane of Sept. 28, 1941, blew down 400,000 banana trees in the Atlantic zone of Guatemala. Shipments from the Atlantic coast of Guatemala in the first nine months of 1941 were 801,602 stems, compared to 1,022,021 stems during the same period in 1940. Total shipments during that time, from both Pacific and Atlantic areas of Guatemala, were 5,404,467 stems in 1941 and 6,850,677 stems in 1940, all to the United States. Honduras shipments in the first nine months of 1941 were 10,176,503 stems, compared to 11,312,199 stems in the first three quarters of 1940. Full-year shipments in 1940 were 14,535,551. Losses from hurricanes in the Tela area reduced the harvest drastically, but new plantations in La Ceiba district reported a 30% increase and largely made up the Honduras loss. Commercial banana growing in the Dominican Republic, the U.S. commerce department reported, was threatened with extinction by the sigatoka disease. Dominican banana exports to the United States reached a high of 825,000 stems in 1939. But later they declined steadily as the plant disease spread, and in the first six months of 1941 were only 5,827,425 kilograms. Exports of bananas from Cuba to the United States were 886,155 lb. in the first ten months of 1941 and 176,232 lb. in the corresponding period of 1940. Exports from Ecuador for the first nine months of 1941 were 966,110 stems. Of this number 463,157 stems were shipped to the United States and 485,240 stems to Chile. (S. O. R.)

Bankers Association, American: *see* AMERICAN BANKERS ASSOCIATION.

Bank for International Settlements. The balance sheet total of the bank which at the end of Dec. 1940 totalled 495,700,000 Swiss francs, after that remained relatively stable, amounting to 495,800,000 Swiss gold francs on March 31, 1941, and receding slightly to 471,500,000 on Oct. 31 of the same year. The volume of the bank's operations was appreciably reduced, for the turn in the political situation in June 1940 inevitably had a depressing effect on the bank's activities. Although its operations in the United States market were made subject to the system of licences in force, in practice these formalities did not prevent business, the bank being granted, as occasion arose, either a general or a special licence.

The net profit for the year ending March 31, 1941, was 5,294,000 Swiss gold francs, which compares with 7,962,000 Swiss gold francs for the preceding year.

In order to maintain the dividend in respect of the 11th fiscal year at the rate of 6% per annum, hitherto paid, it was decided to complete the sum of 7,500,000 Swiss gold francs necessary for this purpose by drawing upon the dividend reserve fund.

In the 11th annual report of the bank covering the business year ended March 31, 1941, it is said that "the Bank for International Settlements has been granted all reasonable opportunities for the conduct of its business, which has thus continued notwithstanding the difficulties of the international situation. The bank has adhered to the principles of scrupulous neutrality which it laid down for itself in the autumn of 1939, confining its activities strictly to transactions whereby no question can possibly arise of conferring economic or financial advantages on any belligerent nation to the detriment of any other. Moreover, no operations are carried out which might directly or indirectly run counter to the monetary policy of the central bank of the country concerned or in practice constitute a circumvention of the legal provisions governing the disposal of the currency of that country. When the bank has been faced with opposing claims to the same assets, it has been careful to examine the legal questions involved . . . and in case of doubt it has adopted a course designed to protect the various interests involved" (F. A. C.)

Banking. The national defense program and consequent expansion of general business stimulated the banking system in the U.S. during 1941. Banks increased their commercial loans and expanded their holdings of U.S. government obligations to aid in financing the defense effort. Many of the nearly 15,000 commercial and savings banks in the U.S. assisted the government in establishing contact with the smaller business firms throughout the country to facilitate the making of defense contracts. Leading city banks first felt the expansion, but as subletting of the larger contracts occurred there was a tendency to increase the proportion of loans and deposits in country banks. Bank deposits reached a new all-time peak of $68,453,000,000, due mainly to increased loans and investments and to added gold holdings which reached a new high of $22,800,000,000.

During 1941 the great influx of gold, which began with the Munich crisis in 1938, dwindled to substantially the level of new gold production. The 6,596 member banks of the federal reserve system, doing the bulk of the commercial banking of the U.S., had deposits of $49,160,000,000 on Sept. 24, an increase of more than $7,000,000,000 over 1940. Reserves of member banks declined during the year principally due to an increase of $3,000,000,000 in outstanding currency to a new peak of $11,224,000,000. Excess reserves were also reduced on Nov. 1 by an increase in reserve requirements of about $1,200,000,000 ordered by the board of governors of the federal reserve system. Excess reserves were thus reduced to about $3,500,000,000 from the peak in 1940

of about $7,000,000,000, absorbing the growth since 1940 but leaving such reserves higher than at any time prior to 1939. The turnover of bank deposits increased, but not proportionately to the growth in deposits, reflecting the continued idleness of funds awaiting investment or other profitable use. Gross earnings were somewhat higher but largely offset by increased expenses. Income from loans and investments was higher due to greater volume, but average rates were somewhat lower. Total service charges collected on deposit accounts continued to increase, and these, together with trust department earnings, again constituted a substantial part of current earnings. Notwithstanding increased earnings, the total dividends declared were less than for 1940.

A factor which might affect future earnings was the passage by congress of legislation making all government obligations issued after Feb. 1, 1941, fully taxable, and imposing a surtax applicable to outstanding bonds. Further orders were issued by the president during 1941, affecting foreign funds in the U.S., culminating in the blocking of balances of all European nationals and the requirement that comprehensive reports, designated TFR-300, be filed for each. Instalment loans were placed under control of the federal reserve board, and certain restrictions were ordered to divert more productive capacity to defense needs. The Federal Deposit Insurance corporation insured deposits in 13,442 commercial banks with total assets of over $70,000,000,000, highest figure ever reported. Losses which had to be absorbed were nominal in amount and eliminated most of the weaker banks. The Export-Import bank took a very active role in developing Latin-American trade. The outbreak of war with Japan on Dec. 7, and later with the other axis powers, served to accelerate the efforts of banking and all other business elements in the U.S. toward war preparations. (*See* also BUSINESS REVIEW: *Securities and Banking;* FEDERAL DEPOSIT INSURANCE CORPORATION; FEDERAL RESERVE SYSTEM; LAW; STOCKS AND BONDS.)

Canada.—Banking as well as all business conditions were profoundly affected by the war. Industrial production expanded rapidly, necessitating increased banking facilities and involving war financing on a large scale. Commercial loans of the ten chartered banks increased from $1,102,000,000 to $1,255,000,000, in spite of direct government financing of many of the new plants producing war supplies. Total investments, largely in government securities, increased from $1,563,000,000 to $1,700,000,000. Earnings did not keep pace with volume and activity, due to somewhat lower rates and, more directly, to increased taxes. In an effort to divert a larger portion of the national income to the war effort, the government placed drastic restrictions on loans to finance instalment purchases. On Nov. 1 a federal program of control over prices, wages, rents and farm incomes was instituted which might have a far-reaching effect on banking and business in the dominion. The Bank of Canada increased its holdings of Canadian government securities from $580,000,000 to $700,000,000. Note circulation was increased from $331,000,000 to $435,000,000.

Great Britain.—The burden on British banking due to the war effort was considerably lessened by increased government financing of war production and by the operation of the lend-lease act passed by the United States congress on March 11, 1941. The volume of bank loans tended to decrease after reaching a new high level in the first few months of the war, the comparative figures being £1,015,000,000 sterling in Dec. 1939, and £839,000,000 sterling in Sept. 1941. On the other hand, security holdings, chiefly government bonds, rose sharply and total deposits reached a new high level of £3,115,000,000 sterling. This was accompanied by an increase in the price level, but the operation of the extensive economic control measures adopted by the British government tended to reduce the acceleration of price increases occasioned by war conditions. (*See* also BANK OF ENGLAND.)

Europe.—Banking throughout Europe was dominated by Germany either through conquest or by control of the economic life of the few countries remaining in a neutral or nonbelligerent status. German banks followed its armies, and financial infiltration was accomplished by control of banks in occupied territories through acquisition of controlling stock interest and other means. Currencies of all occupied countries were based on the reichsmark. Furthermore, reichsmark notes of a type not allowed to be used in Germany were issued to German troops in the various occupied countries and given the quality of legal tender for all payments. Note circulation of the Reichsbank again showed a substantial rise from 12,000,000,000 to more than 17,000,000,000 reichsmarks. German savings deposits increased rapidly to more than 30,000,000,000 reichsmarks, due mainly to lack of goods available to satisfy the enlarged purchasing power. The government provided for the sterilization of such deposits by making them tax exempt if held for a year after the termination of the war. The Bank of France, through a series of conventions with the treasury, advanced 130,000,000,000 francs to meet the costs of the German army of occupation. Note circulation rose from 175,000,000,000 francs to 242,000,000,000 francs. The operations of commercial banks throughout Europe were not made available after the German invasion. (*See* also EXCHANGE CONTROL AND EXCHANGE RATES; SAVINGS BANKS, MUTUAL.)

Investment Banking.—The volume of investment securities other than U.S. treasuries distributed during 1941 was well above the average for the years 1937–41, the figure for ten months ending Oct. 31 being $5,045,469,000. This compares with only $3,750,446,000 in the similar period of 1940. Corporate issues represented $2,324,118,000, the balance being chiefly municipal, farm loan and government agency issues. By a change in government policy, the latter classification would gradually disappear as issues mature, all future financing of government agencies being provided through United States treasury bond and note issues. As in several years before, refundings predominated among new corporate issues due to the attractively low interest rates prevailing, more than 60% being in this classification. However, this compared with 75% in 1940, indicating a definite increase in the volume of new capital raised. Municipal issues were offered in smaller volume than the previous year, due in part to reduction of the relief load caused by improved employment conditions and to the reduction in public works to give increasing emphasis to defense production financed by private and federal funds. The United States treasury issued $15,691,528,000 in bills, notes and bonds in the ten months ending Oct. 31, about half to refund maturing issues, the balance to finance the growing defense industry. No less than $3,451,125,000 were issued in October, the highest volume for any month, and with the entry of the U.S. into the war, even this record seemed soon to be broken.

The Investment Bankers association expressed anxiety at the vast new expenditures of the government for plant expansion in the defense industries, while private industrial financing remained at relatively low levels. Much influence was exercised by the Reconstruction Finance corporation (*q.v.*), which on more than one occasion threatened to overbid private bankers on public utility and railroad equipment issues. The large refunding issue of the state of Arkansas was actually bought by that federal agency in the face of lower bids by private bankers. The Federal Securities and Exchange commission promulgated regulations during 1941, requiring public utility companies in holding company groups to offer new issues to competitive bidding instead of dealing directly with the company's traditional investment banking connection. Considerable dissatisfaction resulted among bankers, and the commission itself recognized this system as not suited to all cases

but entitled to a fair trial. Government, municipal and high-grade corporate bond prices reached record high levels in October, but late November saw a rise in short-term yields followed by lower prices for all bonds with the outbreak of war with Japan in December. (E. B. L.)

Bank of England. The main change in the bank return in 1941 was the steady growth in the note circulation, amounting to £70,000,000 during the first ten months. The figures in the closing months of the year compared with a prewar circulation of about £500,000,000. The chief cause of the rise was the growing war industrial activity, reflected in a record volume of employment and consequent growth in pay rolls. A much larger proportion of the national income was going to people without bank accounts who therefore used currency instead of cheques. This growth in the note circulation necessitated two increases in the fiduciary issue during the year, on April 30 and Aug. 30, effected by a transfer of securities from the banking to the issue department. There was no change, as a result of this, in the outside liabilities of the bank.

The bank continued its duties of administering the national debt, including the new loans issued during 1941. These were the 2½% national war bonds 1946–48; 3% savings bonds 1955–65; and 2½% national war bonds 1949–51. The first issue closed in the summer after raising £494,000,000 since the opening of the year. The last issue opened in the early autumn. The bank also carried through on the government's behalf the vesting of certain securities. These included Indian, Canadian and South African sterling stocks; also a number of securities and other assets required as collateral to the U.S. secured loan to the U.K. were borrowed from holders by the government. The object of the Indian vesting was to provide for the liquidation of part of India's large wartime accumulation of short-term funds in London by repayment of long-term Indian sterling debt. The Canadian vesting was designed to augment British resources in Canadian dollars, and the South African vesting had the effect of increasing the amount of gold, and so potentially of dollars, at the disposal of the U.K. The bank continued to administer the exchange control regulations, which were further developed during 1941.

The work of the bank in regulating the general credit position was increased by the wartime expansion in the ebb and flow of funds out of and into the exchequer. Briefly, if money became too plentiful the banks were invited to increase their loans to the government against treasury deposit receipts. If money became tight, borrowing in this form was reduced and special purchases of bills were made in the market. The chief cause of temporary stringency was sudden and heavy subscriptions to war loans; *e.g.*, London's "war weapons week," and the launching of the "warships week" campaign in October. The closure of the issue of 1946–48 war bonds was also preceded by heavy subscriptions. The spring growth in discounts and advances was due to technical operations arising out of the Indian vesting.

In September Montagu Norman, although in his 70th year, agreed to stand for re-election as governor for a further year, and J. M. Keynes was elected to the vacancy in the bank's directorate caused by the death, from enemy action, of Lord Stamp (*q.v.*). (N. E. C.)

Banks: *see* BANKING; SAVINGS BANKS, MUTUAL.

Banting, Sir Frederick Grant (1891–1941), Canadian scientist and co-discoverer of insulin, was born Nov. 14 at Alliston, Ontario. He was head of the Banting institute, and a member of the National Research Council of Canada after 1937. Dr. Banting joined a base hospital unit as medical liaison officer between Canadian and British armies at the outset of war in 1939, and was promoted to the rank of major. He made frequent trips to England to exchange vital medical information, and as director and correlator of medical research kept in constant touch with his staff of researchers at the University of Toronto. After the start of the war, the Banting institute was turned over to the study of aviation medicine, and, as its chairman, Dr. Banting flew extensively under all conditions to discover means to neutralize the strains caused by high altitude flying and dive-bombing. He also studied conditions associated with tank warfare. While chairman of the associate committee on medical research of the National Research council, his committee developed new methods for preserving blood so that large banks could be held in reserve. Dr. Banting, who was on his way to England from Canada, was killed in the crash of a military plane in the snowdrifts of Newfoundland, Feb. 21. (See his biography in *Encyclopædia Britannica.*)

Baptist Church. The Baptists of the United States reported in 1941 a total membership of 11,269,558 —the Northern convention 1,561,289; the Southern, 5,104,327; two National conventions (Negro), 4,073,252; others, 530,690— an increase of 167,430 above that of 1940.

War engaged the attention of the Northern and Southern groups. In defense of conscientious objectors the former affirmed "the sacred obligation of every Christian to obey his conscience." Renouncing "war as a means of settling international difficulties" and "disapproving totalitarianism," sympathy was expressed "with democratic peoples in their struggle against tyranny," and appreciation of the president's "repeated efforts to keep our nation from armed participation in foreign wars, while giving great aid to the Democracies."

The Southern convention asserting its "abhorrence of war and all its insanity and brutality," nevertheless declared its "belief that some things are worth dying for; worth living for; and (therefore) worth defending even unto death." Later it was careful to record that this resolution "in no way commits the Southern Baptist convention to an approval of war, as a recognized principle in settling international differences." Plans were laid by this convention for the observance of its centennial in 1945 at Augusta, Ga., where the convention was organized in 1845.

The Northern body gave serious thought to the problem of higher education. Many of the colleges were faced with financial difficulties that endangered their future security. All denominational leaders, pastors and laymen, were called upon to endeavour through church, association and convention programs to impress upon the people the need of support for these institutions and also the need of "college men and women carefully, intelligently and spiritually trained to give effective leadership." An emergency fund of $100,000 for this cause was sought on Dec. 7, the Sunday of Sacrifice. (R. E. E. H.)

Barclay, Sir Thomas (1853–1941), British lawyer, was born in Dunfermline, Scotland. He was an honorary member of the Institute of International Law and a vice-president of the International Law association. He was also a member of the Royal Academy of Jurisprudence of Spain and member of the Académie Diplomatique Internationale. An ardent advocate of Anglo-French amity, Sir Thomas was identified in the United States and in Europe with international arbitration and peace movements. Among his publications were: *Law and Usage of War* (1941), *Collapse and Reconstruction* (1919) and *Wisdom of Lang-Sin* (1927). He died in occupied France and a funeral service was held for him in Versailles, Jan. 20. (See *Encyclopædia Britannica.*)

Barium Minerals. About 1,000,000 tons of barium minerals, chiefly the sulphate, with some carbonate, are mined annually, about one-half in Germany and one-third in the United States. In 1940 the United States production was 390,462 short tons, and sales 409,353 tons, indicating a considerable withdrawal from stocks; imports had dropped to 7,391 tons, as against 73,080 tons in 1931. (G. A. Ro.)

Barley. The United States crop in 1941 was estimated Nov. 1 by the department of agriculture as 351,522,000 bu., the largest production of barley on record in the United States. The 1940 crop was 309,235,000 bu.; the ten-year (1930–39) average production, 224,970,000 bu. The acreage in 1941 was 13,977,000 compared to 13,394,000 ac. planted to barley in 1940 and a ten-year average of 10,707,000 ac. Owing to an unusually favourable season, all the important barley states except California reported yields well above the average. The yield in 1941 was 25·2 bu. per ac. In 1940 it was 23·1 bu. per ac.; the ten-year average, 20·6 bu. per ac.

In Canada the program of reducing wheat production and increasing other crops resulted in a larger area sown to barley—4,882,000 ac. in 1941 compared to 3,622,000 ac. in 1940 and a five-year (1935–39) average of 3,553,000 ac. The Canadian crop for 1941, preliminary estimate, was placed at 103,800,000 bu. The 1940 production was 104,256,000 bu., and the five-year average 88,882,000 bu. (*See* also CEREALS.)

U.S. Production of Barley in Leading States, 1941 and 1940

State	1941 bu.	1940 bu.	State	1941 bu.	1940 bu.
Nebraska	40,054,000	22,544,000	Oklahoma	7,218,000	5,780,000
Minnesota	44,980,000	57,348,000	Idaho	7,098,000	5,950,000
North Dakota	41,050,000	28,064,000	Oregon	6,048,000	5,000,000
South Dakota	30,226,000	30,821,000	Michigan	5,890,000	5,796,000

Bartet (Regnault), Jeanne Julia (1854–1941), French actress, was born Oct. 28 in Paris. Mme. Bartet, who was one of the leading actresses of the Comédie Française for 40 years, made her last appearance in *La Hérodienne* in 1919. She had played leading roles in the dramas of Racine, Molière, Marivaux, De Musset, Victor Hugo and Dumas. A report of her death in Paris reached Vichy Nov. 20, 1941. (See *Encyclopædia Britannica.*)

Baseball. Attendance at professional baseball games throughout the U.S. in 1941 showed an increase over the previous year's total. Judge William G. Bramham, president of the National Association of Professional Baseball Leagues, enrolling 41 leagues of six and eight cities or towns each, from coast to coast, with loops into Canada, reported an increase of more than 3,000,000 paid attendance above the 1940 figure, approximating the 18,500,000 of 1939, baseball's centennial year, the all-time high for the minor leagues.

The major leagues, according to Associated Press tabulations during the season, showed a total of 5,220,519 for the American league and 5,029,689 for the National league. Collectively, the major league total fell 31,883 short of 1940 figures, representing chiefly the fact that the American league race, a runaway for the New York Yankees, failed to have the engrossing interest in its closing weeks which 1940's neck-and-neck finish between Detroit and Cleveland generated.

The National league's 1941 race, on the contrary, was a ding-dong affair between Brooklyn and St. Louis, the senior circuit's attendance gaining over 1940. The National league gain, however (181,389), was not as great as the fall-off (213,272) in American league figures.

World Series.—The opening game of the world series between the New York Yankees and the Brooklyn Dodgers on Oct. 1 set an all-time high for attendance at a world series game, 68,540 ("all-time" in this case covering postseason play between major league championship teams dating from 1884 and annually without omission since 1905). The previous high was 66,669, set Sept. 30, 1936, at the same field (Yankee stadium, New York) in the opening game between the two New York teams, Yankees and Giants.

The 1941 world championship was won by the Yankees, four games to one, setting new records for New York's American league representative club. It was the eighth straight world series victory for the club in eight appearances since defeat at the hands of the St. Louis Cardinals in 1926. Until beaten by Brooklyn in the second game of the 1941 world series, the Yankees had a string of ten straight games won in world series play, also an all-time record.

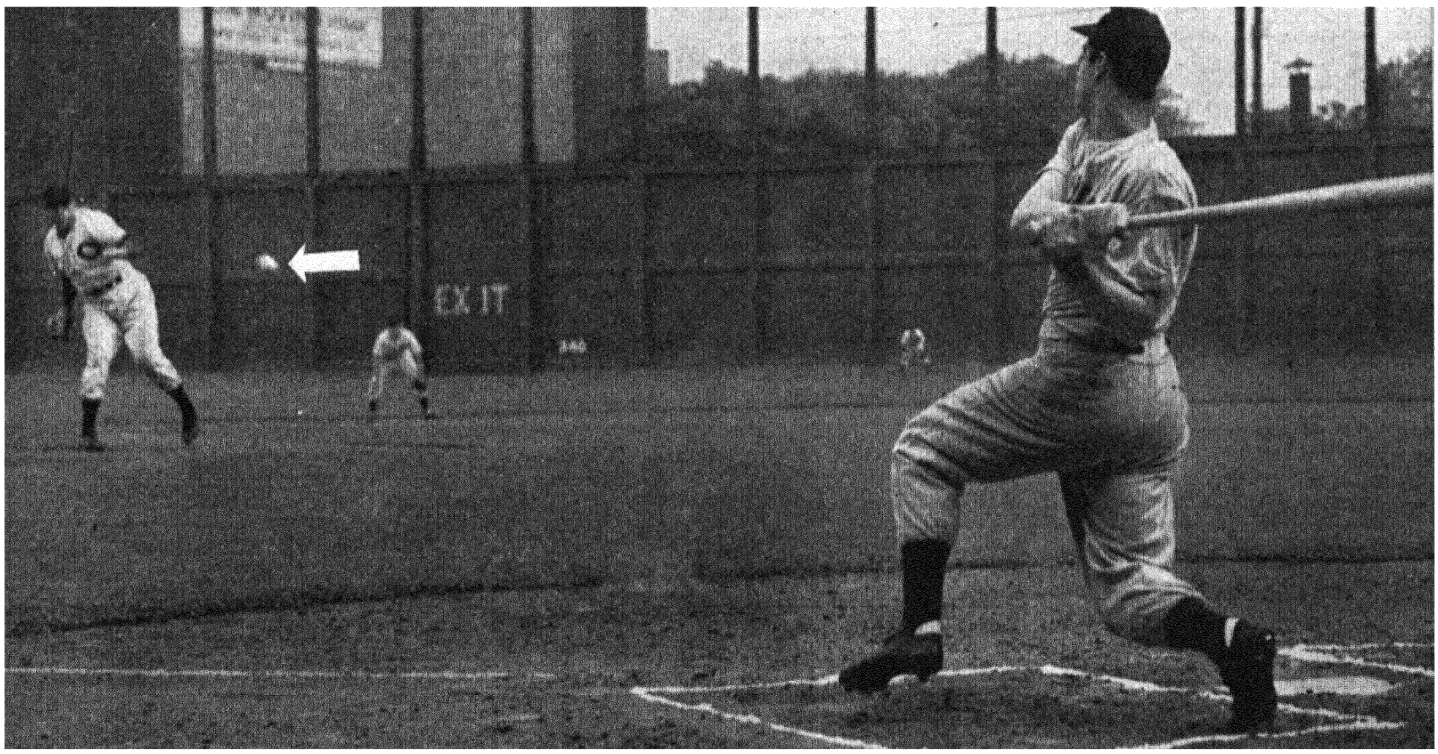
All five games of the world series were close and hard fought, the first two on the Yankee grounds in the Bronx, the rest at Ebbets field, Brooklyn. The Yankees won the first game, 3 to 2, taking the lead on a homer by second-baseman Joe Gordon, the all-around individual star of the series, in the second inning, and keeping ahead all the way.

Brooklyn's 3–2 victory in the second game featured great pitching by the Dodger ace, Whitlow Wyatt, who shut out the "Bronx Bombers" the last six innings. Facing a 2–0 disadvantage after three innings of play, the "Brooklyn Bums" tied the score in the fifth and put over the winning run in the sixth on a single by Dolph Camilli, National league's leading run-driver and named by the official jury of baseball writers as the National league's most valuable player of 1941.

The 2–1 Yankee victory in the third game high-lighted New York's youthful left-handed pitcher, Marius Russo, who allowed the Dodgers only four hits. New York scored its pair of runs in the eighth inning, the first driven across by Joe DiMaggio, Yankee centre fielder and American league's most valuable player of 1941.

In this game the first serious adverse "break" afflicted the losing side when a savage drive from the bat of young Russo struck his pitching opponent, Fred Fitzsimmons, on the left leg in the seventh inning and put him out of action for the duration. Up to this moment, the rival aces were locked in a scoreless duel which bade fair to stretch on and on.

The fourth game, however, staged the most dramatic episode of



JOE DIMAGGIO of the New York Yankees established a major-league baseball record by hitting safely in 56 consecutive games in 1941. Here he is shown hitting past Al Milnar, Cleveland pitcher, in the 56th game July 16. Arrow indicates the ball

the series, the play which was not only the turning point of the game but probably decided the series as a whole. The Dodgers, thanks to a home run over the wall in right centre by their centre-fielder, the National league batting champion, Pete Reiser, went ahead with two runs in the fifth inning and held a 4–3 lead with two out in New York's half of the ninth.

Needing one put-out to end the game with Brooklyn victorious and the series in a deadlock, two games to two, the home team apparently achieved the objective when the Yankee batter, Tom Henrich, swung and missed for a third strike.

The pitch by the Dodger pitcher, Hugh Casey, was a low and sharp-breaking curve. The Brooklyn catcher, Mickey Owen, only partly blocked the ball instead of catching it. Entitled to a chance for first base as soon as the ball touched the ground, Henrich set out for the base and attained it before Owen could retrieve the ball and throw it there. Thus reprieved, the Yankees swung into action with their bats, scoring four runs before being retired. The vital hits came from the bats of husky Charlie (Killer) Keller and DiMaggio.

The last game, though the score was close, 3 to 1, offered no thrill comparable to those of its predecessors. The Yankees scored two runs in the second inning. Their pitcher, Ernie Bonham, held the advantage throughout over Wyatt, Dodger mound hero of the year and of the series.

All-Star Game.—The entire proceeds of the annual All-Star game between picked teams representing the two major leagues were donated to the United Service organizations, in amount $53,226.27. The game was played in Briggs stadium, Detroit, July 8. Attendance, 54,674, about 15,000 less than the record for All-Star game attendance, set in Cleveland Municipal stadium (69,812) in 1935. The American league victory in Detroit by a 7–5 score was the sixth for the American league in a series of nine games played annually, starting in 1933.

With the National league team leading, 5 to 3, with one out and the bases filled, a grounder to shortstop by DiMaggio set up a double play in prospect which would end the game. The out was executed at second base, but the throw to first base was wild and DiMaggio was safe, the score becoming 5–4 on the run that crossed the plate on the play. The next batter, Ted Williams, of the Boston Red Sox, American league 1941 batting champion, then brought the contest to a dramatic conclusion by driving a home run over the roof of the right-field grandstand, scoring 3 runs.

Pennant Races.—The Yankees made history in winning their American league pennant as well as in their world series triumph. They clinched their title Sept. 4, the earliest date on record in either major league for the 154-game schedule in operation since 1901. It was their fifth pennant in six calendar years, also an all-time major league record.

By contrast, the Dodgers won their pennant in the most sustained two-team race in the history of major league baseball. From opening day to the finish Brooklyn and the St. Louis Cardinals kept so close in the percentage table that there was never a time, all season long, when either side could take a deep breath with the feeling that its lead was anywhere close to "commanding."

Starting April 27, the Dodgers and Cardinals kept first and second places as their own throughout the season. May 3 they were the only two National league clubs above the .500 mark. Most of the first six weeks of the season the Giants were the only other club which won more than half of its games. On July 15, when the Dodgers beat the Cubs a double-header, they enjoyed a four-game lead over the Cardinals, the largest margin held by either club over the other at any time in the course of the year. For the space of about an hour that afternoon the Dodger lead was actually 4½ games. Their double-header was finished before a decision was reached in the St. Louis-Philadelphia game in Philadelphia, a 16-inning affair won by the Cardinals.

This lead quickly dwindled, for on July 16 the Red Birds invaded Flatbush and promptly defeated the Dodgers in a night game, going on to make a clean sweep of the two-game series two days later. In 15 days the scene had shifted so that St. Louis held a three-game margin. On four occasions in late May and June the Cardinals also attained a three-game lead over the Dodgers, their tops for the year. In early June, first place changed hands six times in nine days.

For the first time since 1928 the Brooklyn pitching staff had an ace who passed the 20-game mark in victories. Both Whitlow Wyatt and Kirby Higbe won 22. The 1941 Dodgers led the league in homers for the first time since 1908. Camilli was the first Dodger to win the National league home run championship since Jacques Fournier in 1924. Reiser was Brooklyn's first batting champion since Lefty O'Doul in 1932, and the fifth man ever to win the batting title for Brooklyn in the 51 years of its National league history, sharing the honour roll with Dan Brouthers (1892), Jake Daubert (1913 and 1914), Zack Wheat (1918) and O'Doul.

Individual Achievements.—Camilli, elected the National league's most valuable player by the Baseball Writers' Association of America, led the league both in home runs and in runs batted in. His teammate, Reiser, second in the voting, was the first player ever to win a batting championship in his first complete season of major league play. Wyatt, Dodger ace, ranked third.

The voting in the American league was closer. DiMaggio's outstanding batting performance was rivalled by that of Williams, the batting champion, whose average of .406 was the first above .400 in the major leagues since Bill Terry of the Giants in 1930, and the highest in the American league since George Sisler's .420 in 1922.

DiMaggio, though his batting average for the season was nearly 50 points below that of Williams, established a new record for hitting in consecutive games, his mark of 56 surpassing the American league record of 41, set by Sisler in 1922, and the National league record of 44 straight, set by Willie Keeler in 1897.

The value of DiMaggio's streak is reflected in the fact that when it started, May 15, the Yankees were in fourth place, five and one-half games behind the league leader. When it ended, July 17, the Yankees were in first place by a seven-game margin.

Pitching honours for the year in the National league starred Elmer Riddle of the Cincinnati Reds as champion in both the won-lost percentage (19 and 4) and in earned-run average (2.24).

Vernon Gomez of the Yankees was the American league leader by percentage, 15 wins against 5 defeats, while the earned-runs award went to Thornton Lee, Chicago White Sox, with 2.37.

Minor Leagues.—All 41 minor leagues finished out their schedules to a championship decision. The Columbus, O., Red Birds, American association champions, won the junior world series over the Montreal Royals, International league play-off champions. Seattle was the pennant winner in the other class AA organization, the Pacific Coast league.

In the class A-1 bracket, the Nashville Vols, Southern league play-off champs, prevailed over the Texas league representatives, the Dallas Rebels, in the annual Dixie series.

Thirty-six of the 41 leagues used the Shaughnessy play-offs, a system of postseason competition in which the first division clubs play a round-robin elimination series to determine the final championship. In the three class AA leagues, Columbus won both the American association pennant and the play-off series, as did Seattle in the Pacific Coast league. In the International league, the Newark pennant winners were defeated in the play-offs by the second-place Montreal Royals.

Both pennant winners in the class A-1 circuits toppled in the play-offs. Houston, in the Texas league, went out in the first round, the fourth place Dallas Rebels becoming Shaughnessy champions. The Nashville Vols, second-placers in the Southern association pennant race, conquered the flag-winning Atlanta Crackers in the play-offs.

Besides Columbus and Seattle, ten other pennant winners withstood all challengers in the Shaughnessy finals: Mobile in the Southeastern league; Durham in the Piedmont league; Harrisburg, Pa., Interstate league; Joplin, Western association; Dothan, Alabama State league; Oneonta, N.Y., Canadian-American league; New Iberia, La., Evangeline league; Wilson, N.C., Coastal Plain league; Logan, W.Va., Mountain State league; and Elizabethton, Tenn., Appalachian league.

Second-place teams victorious in Shaughnessy rounds in addition to Montreal were: Columbia, S.C., which vanquished the pennant-winning Macon Peaches in the South Atlantic league; Cedar Rapids, victors over the Indiana-Illinois-Iowa league flag-winners, the Evansville Bees; Hot Springs, Ark., toppling the cotton states' first-place Monroe, La., team; Erie, Middle Atlantic champs over Akron's pennant club, Salem, topping the Virginia league after Petersburg won the pennant; Ogden, Utah, Pioneer league champs over Boise; Butler, Penn State association, over Johnstown; Salisbury, North Carolina State, over Kannapolis; Miami Beach, Florida East Coast, over West Palm Beach; and Bradford, Pennsylvania-Ontario-New York, over Jamestown.

Only two third-place teams beat their pennant winners, the Elmira Eastern leaguers, who conquered Wilkes-Barre, and Clovis, N.M., victors over Big Spring, Tex., in the West Texas-New Mexico league.

Besides Dallas, fourth in the Texas league pennant race, but first in postseason play, eight more fourth-place clubs won out over pennant winners: Eau Claire, Wis., Northern league, over Wausau, Wis.; Sanford, N.C., Bi-State league over Leaksville, N.C.; Easton, Md., Eastern Shore league, over Milford, Del.; Pueblo, Colo., Western league, over Norfolk, Neb.; Thomasville, Ga., Georgia-Florida league, over Albany, Ga.; Mayfield, Ky., Kentucky-Tennessee league, over Jackson, Tenn.; Leesburg, Florida State league, over St. Augustine; and Sheboygan, Wis., Wisconsin State league, over Green Bay.

The leagues without Shaughnessy play-offs posted the following champions: California league, Santa Barbara, Western International, Spokane; Arizona-Texas, Tucson; Michigan State, Flint; Northeast Arkansas, Newport; and Ohio State, Fremont.

Independents.—Following district, state and sectional play-offs, Enid, Okla., became national champion in the final round of the National Semi-Pro congress, enrolling about 8,000 independent teams throughout the United States.

The American Legion's Junior baseball tournament, in which the teams qualified by states, crowned San Diego, Calif., the 1941 champion in the finals. (W. E. Bt.)

Basketball. An estimated 90,000,000 spectators paid admissions during the 1941 season to witness the lightning speed of "name" teams, conference, sectional and city champions in the U.S. All attendance figures were shattered during the regularly scheduled double-header programs and invitation tournaments in Madison Square Garden, New York, when a total of 317,849 people saw the games.

The Long Island university Blackbirds conquered the Wisconsin Badgers, 56–42, in one of the glamour contests of the season. Wisconsin became the "superior" team by annexing the Big Ten Western Conference championship, and later by beating Washington State in the N.C.A.A. final in Kansas City. Washington State went on to win the North Pacific Coast conference. Dartmouth ran off with the Eastern Intercollegiate league honours for the fourth year in a row. Duke succeeded North Carolina in the Southern conference, and Arkansas beat Rice for the Southwestern conference. Kansas and Iowa tied for the Big Six crown.

The National Y.M.C.A. championship was won by the Division street team of Chicago. The Eastern Athletic club title went to the Columbus Council K. of C. quintet. The National A.C.U. crown was taken by the Hollywood 20th Century quintet, beating the Olympic club, of San Francisco, Calif., after nosing out the defending champion, Phillips 66 Oilers of Oklahoma. The Ohrbach A.A. team won the Metropolitan (N.Y.) A.A.U. title for the third consecutive year.

Sports writers agreed that Frank Baumholtz, of Ohio university, be named basketball's outstanding player for 1941. Ossie Schectman of Long Island university was second choice. In the competitions in and around New York, the Seton hall (N.J.) five scored 42 consecutive victories, with the great Bob Davies in the line-up, yet Seton hall bowed to Long Island university by the big score of 49–26. Voted to the All-American basketball team were Angelo Luisetti, Frank Lubin, Carl Knowles and Ralph Grannini, of the Olympic club, and Chet Carlisle, of Oakland, Calif. (J. B. P.)

Basutoland: *see* British South African Protectorates.

Bauxite. World production of bauxite during recent years is reported in the accompanying table, the figures for 1940 being largely estimates. British and Canadian demand centres on British Guiana, that of the United States on Surinam (Dutch Guiana), while the axis powers control the outputs of Greece, Hungary, Italy, Yugoslavia and probably France.

World Production of Bauxite
(Metric tons)

	1929	1937	1938	1939	1940
Br. Guiana	220,119	366,700	382,400	483,700	550,000
France	666,348	688,200	682,400	680,000	700,000
Greece	..	137,400	179,900	186,900	180,000
Hungary	389,152	532,700	540,700	570,200	560,000
Italy	192,774	386,500	360,800	483,965	380,000
Neth. E. Indies	..	199,000	245,400	230,700	274,375
Surinam	219,603	392,400	377,200	511,600	615,434
U.S.S.R.	..	230,000?	250,000?	250,000?	270,000
United States	371,648	431,400	315,900	381,300	445,958
Yugoslavia	103,366	354,233	396,400	318,800	260,000
World Total	2,185 000	3,750,000	3,850,000	4,370,000	4,500,000

United States production was considerably increased in 1940, and further increase was to be expected in 1941, but domestic sources cannot meet the demand, and in both 1939 and 1940 about 56% of the consumption was imported, mostly from Surinam. Imports in 1940 totalled 629,552 long tons, 90% of which was from Surinam, as compared with a production of 439,413 tons. Because of the importance of the Surinam deposits in maintaining adequate supplies of bauxite in the United States, that country sent troops to the mines late in Nov. 1941, to protect them. (G. A. Ro.)

Beans, Dry. A traditional army food, beans achieved their largest production on record in 1941 in the United States—18,226,000 bags by estimate of the department of agriculture Oct. 10. The previous highest yield was 16,074,000 bags in 1940. The ten-year (1930–39) average crop was 13,297,000 bags (100 lb. bags, uncleaned). The 1941 planting was 2,100,000 ac.; the carry-over, 3,300,000 bags.

U.S. Production of Dry Beans in Leading States, 1941 and 1940
(In 100 lb. bags)

State	1941	1940	State	1941	1940
Michigan	6,163,000	4,309,000	New York	1,256,000	903,000
California	5,332,000	5,492,000	New Mexico	791,000	656,000
Idaho	1,014,000	1,667,000	Wyoming	649,000	605,000
Colorado	1,460,000	1,760,000	Montana	250,000	270,000

(S.O.R.)

Beard, Daniel Carter (1850–1941), U.S. artist and author, and one of the founders of the Boy Scout movement in the United States, was born June 21 in Cincinnati, Ohio. His father was a portrait painter and young Beard, who inherited his ability, studied at the Art Students' League in New York from 1880 to 1884. He established his reputation with his illustrations for Mark Twain's *A Connecticut Yankee at King Arthur's Court,* published in 1889, and for *Tom Sawyer Abroad.* But Beard's major interest was the youth movement. In 1878 he found that the sprawling U.S. cities had no playgrounds and parks for the development of healthy children. He then launched a drive to take children out of the slums into the open countryside, and the fruit of this campaign was the creation in 1908 of the Boy Scouts of America, a movement in which he was one of the leaders. By 1940 there were nearly 1,500,000 boy scouts in the United States and "Uncle Dan," as Beard was affectionately known, was national scout commissioner. In 1940, 50,000 boy scouts gathered in the court of peace in the New York world's fair to pay homage to Beard on his 90th birthday. He was the author of a number of books for boys and wrote and illustrated a monthly article for *Boys' Life,* official publication of the Boy Scouts. He died at Suffern, N.Y., June 11.

Beaverbrook, William Maxwell Aitken, 1ST BARON (1879–), British publisher and statesman, was born May 25, the third son of a Scotch Presbyterian minister stationed at Newcastle, N.B., Canada. Educated in the public schools of Newcastle while he peddled newspapers, he entered business and formed a successful merger that earned him a fortune. He went to London, entered politics and was elected member of parliament in 1910. He was with the Canadian expeditionary force in France in 1915 and later was officer in charge of Canadian war records. In 1918 he was appointed chancellor of the duchy of Lancaster and minister of information. Meanwhile, in 1917, he had purchased control of the London *Daily Express,* a failing newspaper which by the 1930s he had converted into the largest daily in the world, with a circulation in excess of 2,500,000. Lord Beaverbrook, as he was known after 1917, also became publisher of the *Sunday Express* and the *Evening Standard.* On May 14, 1940, he was named by Winston Churchill minister of aircraft production, and on Aug. 2 he was admitted to the war cabinet.

On May 1, 1941, Churchill removed him from the ministry of aircraft and appointed him minister of state. The duties of this newly created office were not itemized at the time, but it later turned out that Beaverbrook was the prime minister's chief "trouble-shooter" in matters of production, supply, procurement, U.S. lend-lease aid, etc. In a further effort to speed up the production of British arms, Churchill appointed him minister of supply June 29. Beaverbrook was present at the "Atlantic charter" meeting between Roosevelt and Churchill in August and proceeded to Washington to confer with U.S. government officials on lend-lease problems. He represented Britain at the three-power (U.S.-British-Russian) conference which opened in Moscow Sept. 29. In December, Beaverbrook again accompanied Churchill to the United States, and he remained in Washington to discuss allied problems of supply. (*See* also *Encyclopædia Britannica.*)

Bechuanaland Protectorate: *see* BRITISH SOUTH AFRICAN PROTECTORATES.

Bee-keeping. Honey, with the exception of wheat, was apparently the only generally used food crop not included in the United States' 1941 defense program urging large increase in the production of foods in 1942. Although a sugar shortage, with quota rationing, was impending, honey apparently was overlooked. Prices for honey advanced in 1941 only about 15%, a general average estimated by the *American Bee Journal,* Hamilton, Ill. This advance was estimated at 10% in eastern and middle west states and as high as 25% in prairie and mountain states. Expectancy was expressed in the trade that the price to carlot producers might rise to 6 or 7 cents per pound. The normal production of honey in the United States is about 160,000,000 lb. Much of the production, instead of coming from individual farms, is from large apiaries favourably situated as to bee pasture. Shipments of bees from the United States to Canada in April, May and June of 1941 were reported by the *American Bee Journal* as valued at $199,580. (S. O. R.)

Belgian Colonial Empire. The table below gives material relative to the colonial and mandated territories administered by Belgium (*q.v.*). Total area, 948,000 sq.mi.; total population (est. Dec. 31, 1939), 14,131,000.

History.—The Congo remained in 1941, as it was in 1940, one of the main assets of Belgian resistance, and its natural resources were one of the principal contributions of Belgium to the British war effort. On Jan. 21, two agreements, one economic and the other financial, were signed in London. The first provided that certain raw materials produced in the Congo, particularly those necessary to the prosecution of the war, would be sold to Great Britain. The second fixed the value of the Congo franc at 176.625 to the £, and provided that the whole production of gold would be placed at the disposal of the Bank of England against payment in pounds sterling.

Although the Belgian government and the Congo administration had remained in complete agreement during the last six months of 1940, a prolonged visit of M. de Vleeschauwer, minister of colonies, brought about a closer contact, not only with the Belgian colony but also with the natives. The minister, in collaboration with the governor general, M. Ryckmans, took a series of measures necessitated by the circumstances and the changes brought about by the war in Belgium's trade. After paying a visit to Kenya and to South Africa, where he met Gen. Smuts, M. de Vleeschauwer returned to London in the late spring.

mand of Gen. Gillaert took part in the operations pursued during the summer against the Italians in Abyssinia. They distinguished themselves on several occasions, particularly in the conquest of the Galla Sidano, where 1,200 Italians and 2,000 native soldiers were made prisoners. This action led to the capitulation of 15,000 men, the total Italian forces south of the Blue Nile. (E. CA.)

Belgian Congo: *see* BELGIAN COLONIAL EMPIRE.

Belgium. Area 11,775 sq.mi.; pop. (est. Dec. 31, 1939), 8,396,276; chief towns (pop. Dec. 31, 1938): Brussels and suburbs (cap., 912,774); Antwerp (273,317); Ghent (162,858); Liége (162,229). Ruler: King Leopold III; prime minister (in exile): Hubert Pierlot; languages: French and Flemish; religion: Christian (mainly Roman Catholic).

History.—Events connected with Belgium in 1941 may be roughly divided into two groups, the one concerned with the activity of the government and the refugees in Great Britain, and the other with the attitude of 8,000,000 people who remained under German occupation.

Belgian Government in Great Britain.—As soon as the Belgian ministers were able to reach London after the collapse of France, they took a series of measures to bring into the war effort all the country's remaining resources. All Belgian men of military age in Great Britain and elsewhere were called up. By 1941 they formed, with the veterans of the 1940 campaign who were able to escape, the nucleus of a new Belgian army and air force. A large proportion of the Belgian merchant navy joined in the war effort, with a number of fishermen, munition and agricultural workers. The devotion to duty of airmen and sailors was on several occasions acknowledged by the British authorities. Belgian man power was completely mobilized.

The same may be said of economic and financial resources. An agreement signed Jan. 21, 1941, between the British and Belgian governments, placed the reserves of the Congo, in gold and war material, at the disposal of the British empire (*see* BELGIAN COLONIAL EMPIRE).

The misunderstandings which arose in 1940 concerning King Leopold, his conduct of military operations and the surrender of the Belgian army, were the subject of several publications, including *The Prisoner of Laeken,* by Emile Cammaerts, and the official *Grey Book* issued in September by the Belgian ministry of foreign affairs. Two British cabinet ministers, Anthony Eden and Oliver Lyttelton, paid homage to the dignified attitude of the Belgian sovereign who, by his refusal to collaborate in any way with the occupying power, had become the centre of resistance of the Belgian people at home and abroad.

On June 12 the Belgian government joined in the common declaration of collaboration in war and peace adopted by the representatives of the Allied nations, convened at St. James's palace by Prime Minister Churchill. They also joined in the resolution passed at the second meeting of the Allied council in September, endorsing the eight points of the Atlantic charter.

The Belgian People Under German Occupation.—From the beginning of the year it was apparent that the German authorities would be as powerless to conciliate Belgian opposition during World War II as during World War I. Their efforts to enlist support through the action of a few fifth columnists succeeded only in discrediting the few Rexist and Separatist leaders who lent themselves to this manoeuvre. Resistance was stiffened through the influence of the clergy and the trade unions. Although these unions and societies, whether Catholic or Socialist, had been dissolved or placed under German control, they retained a considerable influence, and the German press on many occasions expressed its dissatisfaction at the unwillingness of Belgian workers to increase production or to go and work in Germany. Only the threat of starvation compelled about 200,000 unemployed to do so. The removal of patriotic high officials from ministerial departments, and of a number of burgomasters and aldermen—among these the successor of Brussels' Burgomaster Max—increased the resistance already stirred by a number of seizures and requisitions. During the last months of the year, public demonstrations, the activity of the secret press, including a new *Libre Belgique,* and various acts of sabotage increased in gravity, and the Germans were compelled to resume the violent measures which their military leaders had adopted in 1914–18. Confinement in prison camps and individual sentences of imprisonment were replaced by the arrest of numerous hostages and their summary execution. The food situation grew more and more critical, and conditions made it likely that the life and health of the children of the poor would suffer gravely during the winter. Nevertheless, the spirit of the people and their faith in ultimate deliverance had never been so strong since the beginning of hostilities.

In a pastoral letter read in Belgian churches on Dec. 7 it was revealed that on Sept. 11 at Laeken castle King Leopold had married Mlle. Mary Lelia Baels, who took the name of Princess de Rethy. (E. CA.)

CHILDREN OF BELGIUM at a soup kitchen in 1941. Many children, according to an investigation by Herbert Hoover's Committee on Food for the Five Small Democracies, were so undernourished they could not attend school

Education.—In 1938: primary schools 8,712; scholars 955,038; higher schools 273; scholars 86,279; universities (1937–38) 4; students 10,776.

Banking and Finance.—Revenue, ordinary (est. 1940) 11,343,032,000 francs; expenditure, ordinary (est. 1940) 11,632,978,000 francs; public debt (Dec. 31, 1939) 59,318,300,000 francs; notes in circulation (Dec. 31, 1939) 27,994,000,000 francs; gold reserve (Dec. 31, 1939) 17,968,000,000 francs; exchange rate (average Jan.–March 1940) 1 belga = 16.88 U.S. cents.

Trade and Communication.—External trade (merchandise): imports (1939) 19,690,000,000 francs; exports (1939) 21,670,000,000 francs. Communications and transport: roads, suitable for motor traffic (1939) 6,571 mi.; railways, open to traffic, main (1939) 3,190 mi.; airways (1938), distance travelled 1,457,050 mi.; passenger mileage 8,255,980 mi.; baggage mileage 156,762 ton mi.; mail mileage 78,412 ton mi.; newspapers 52,504 ton mi. Shipping (July 1, 1939) 408,418 net tons; tonnage launched (July 1938–June 1939) 27,600 gross tons; vessels entered, in net tons (monthly average 1938) 2,497,000; (July 1939) 2,801,000; cleared (monthly average 1938) 2,502,000; (July 1939) 2,803,000; motor vehicles licensed (Dec. 31, 1938): 155,174 cars; 77,600 commercial; 67,016 cycles; receiving set licences (1938) 1,082,200; telephone subscribers, local (1938) 287,323.

Agriculture, Manufacturing, Mineral Production.—Production 1939 (in metric tons): wheat 349,000; oats 724,200; rye 349,400; potatoes 3,323,200; coal 29,847,000; pig iron and ferroalloys 3,068,000; steel 3,111,000; beet sugar 240,500; barley 51,000; butter 61,000; margarine 60,700; artificial silk 5,900. Industry and labour: industrial production (1929 = 100) (average 1939) 83.3; (Jan. 1940) 79.1; number wholly unemployed (average 1939) 195,211; (March 1940) 163,598.

Bell, Alexander (1887?–1941), British chief of the criminal investigation department of Scotland

Yard, started his career as a crime detector while he was a rookie policeman. Two factors were responsible for his rise to the head of Scotland Yard: a sharp nose for crime and an unimpressive appearance. In 1932 he became a national hero when he caught the ringleaders of the Dartmoor prison mutiny. Bell, a detective-sergeant at the time, was promoted to inspector and solved a sensational poison crime that further enhanced his reputation. He devoted his later years to investigating bucket-shop operators at which he was eminently successful because he looked like a "sucker" ripe for fleecing. Throughout his 30 years on the metropolitan police force, Bell relied heavily on reading in criminal psychology, and he left an extensive library on the subject. He died in London, July 5.

Benefactions: *see* DONATIONS AND BEQUESTS.

Bentonite. The production of bentonite in the United States in 1940 increased to 247,132 short tons. Much of the increased demand that had developed during later years had been as a substitute for fuller's earth as a filtering and bleaching agent in the refining of petroleum and also as a fluid mud to flush out the cuttings in well drilling. A number of minor uses are based on bentonite's peculiar property of absorbing large amounts of water to make an emulsion that remains in suspension indefinitely. (*See* also FULLER'S EARTH; MICA.) (G. A. Ro.)

Berenschot, Gerardus Johannes (1887–1941), Dutch soldier, born July 24, in Solok, Sumatra, was named commander in chief of the Netherlands Indies army in 1939. He helped mechanize the colony's army. Gen. Berenschot was killed in an aeroplane accident near the airport of Batavia, Netherlands Indies, Oct. 13.

Berg, Ernst Julius (1871–1941), U.S. electrophysicist and mathematician, was born Jan. 9 in Ostersund, Sweden. He studied engineering at the Royal Polytecknicum in Stockholm and went to the United States in 1892 to work as an assistant to Charles P. Steinmetz. Like Steinmetz, he worked as consulting engineer with the General Electric company in Schenectady, 1892–1909, and then joined the faculty at Union college, where he became dean of engineering in 1932. Dr. Berg was a pioneer in the radio field and in 1916 produced the first two-way voice program. He also made important contributions in developing rotary converters and in the field of electromagnetic radiation. He collaborated with Steinmetz on several technical books and with British mathematicians on calculations of value in electrical engineering. He died Sept. 9 in Schenectady, N.Y.

Bergson, Henri (1859–1941), French philosopher who disdained formula in thought and was author of the famous treatise on laughter (*Le Rire*), was born Oct. 18 in Paris. His departure from cut-and-dried presentation in his lectures drew crowded audiences at the Collège de France. In 1914, when he began a new series of lectures, French society women suddenly became "Bergson-conscious" and sent their grooms and valets to his classroom to hold seats for them. In 1918 the eminent French thinker gave up teaching because of ill-health, and his last important work, *The Two Sources of Morality and Religion,* was published in 1932. Bergson, who faded from the public eye after his retirement, reappeared in Dec. 1940.

The Vichy government passed a law barring all Jews from holding educational posts but exempted Dr. Bergson because of his contributions to French culture. The aged thinker refused, however, to accept the exemption, renounced all honours because of the discriminatory legislation and lived up to his own philosophy that "one should think like a man of action and act like a man of thought." Other later books by Bergson are *Reflexions sur le temps, l'espace et la vie, Le matérialisme actuel* (1932) and *La pensée et le mouvant* (1934). He died Jan. 4 in France. (See *Encyclopædia Britannica.*)

Berlin. The residence of Hohenzollern electors, kings and emperors from 1442 to 1918, and capital of the German reich since 1871, Berlin is the largest and most important city of Germany. Reorganized in 1920 to include several suburbs, greater Berlin in 1939 had an area of 332 sq.mi., and a population of 4,332,000. Its favourable situation in north Germany on the River Spree, between the Elbe and the Oder rivers, affords it cheap water transportation through Germany's wide-reaching system of rivers and canals. It is also the centre of Germany's network of railways, motor highways and commercial air lines. Politically important as the seat of the Prussian and German governments, it grew rapidly after 1860 as an industrial and banking centre. British bombing during 1940–41 destroyed the interior of the opera house and many other buildings. To lessen the danger from air attacks, important landmarks like the east-west axis highway, west of the Brandenburg Gate, were camouflaged with a great network of foliage. Many children were sent for safety to other parts of Germany. (S. B. F.)

Bermuda. A British insular colony, 580 mi. east of Cape Hatteras, with an appointed governor and an elected assembly; area, 19¼ sq.mi.; pop. (March 26, 1939), 30,516 (aside from semitransient tourists and members of the defense forces), of whom 62·9% were Negroes. Governor: Viscount Knollys (succeeded Lt. Gen. Sir Denis K. Bernard Aug. 27, 1941).

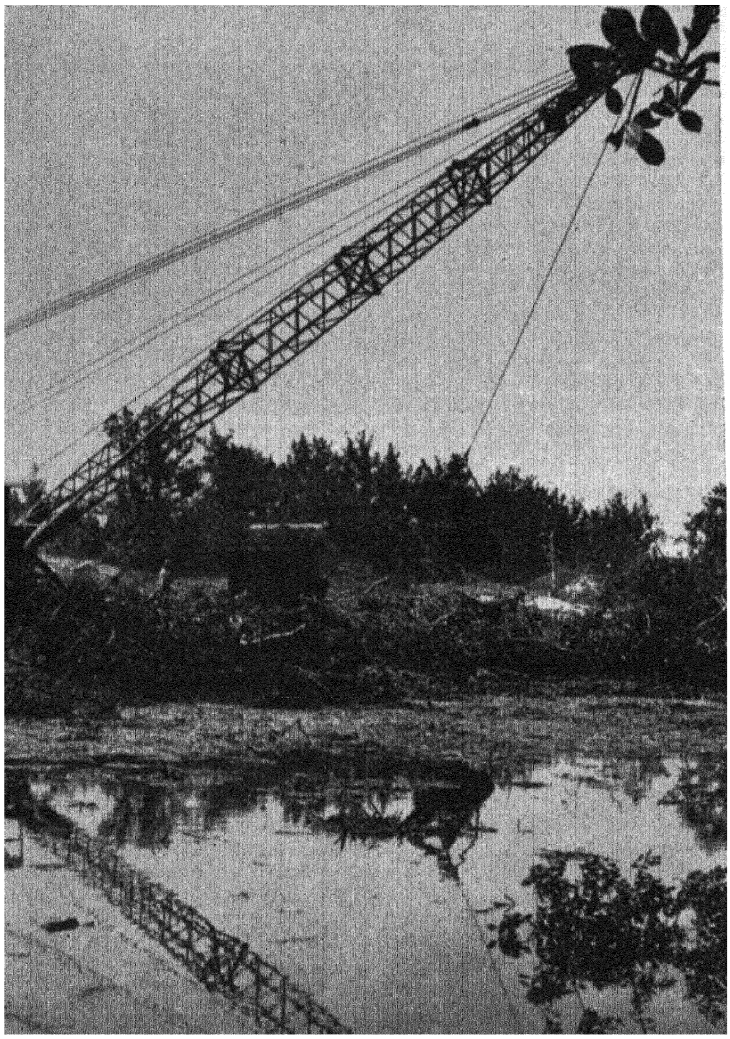
History.—World War II and its ramifications continued to dominate the course of events in Bermuda throughout 1941, with far-reaching economic and other consequences. The colony was not only a major centre of operations for prosecution of the war in the Atlantic, but also an outpost of western hemisphere defense. Although the tourist trade was but a third of normal, the addition of nearly 5,000 United States naval and air base personnel, an estimated 1,000 censors, and heavily increased British naval and other forces sharply strained the island's facilities, causing serious housing and water shortages and necessitating the shipment of fresh water from the U.S. mainland in July. Labour shortage was offset by the importation of 200 Barbadian Negro labourers.

In March the United States formally took over 526 ac., 1/13 of the colony's entire land area—acquired for naval and air bases in Sept. 1940. The base was formally commissioned on July 1, as "Kindley field," and by the end of the year an estimated 4,500 United States marine and other forces were in Bermuda. The necessary eviction of families from the acquired areas aroused considerable local resentment, as did fears that sovereignty of the islands themselves would be transferred to the United States. These were vociferously aired in the Bermudian assembly. The assembly, too, expressed its disapproval of the British policy of appointing military men to govern the colony. Of more constructive nature was its action in lifting Bermuda's half-century-old ban on the use of automobiles.

Education.—Bermuda had 30 government-aided schools in 1941, with enrolment of nearly 5,000, more than 15% of the whole population.

Finance.—The monetary unit is the pound sterling (about $4.03½). With the influx of United States military and naval forces in 1941, agitation was directed toward a shift to a decimal system of currency.

Trade and Resources.—In 1940 imports, chiefly foodstuffs and manufactured goods, totalled £1,469,504 (1939: £1,750,536), with 40.8% from the United States (1939: 46.4%), 24.2% from Canada (1939: 16.4%) and 22.7% from Great Britain (1939: 27.2%). The decline in imports from the United States was due to restrictions on purchases from non-empire countries. In the first nine months of 1941, the total reached £1,659,039, promising to equal or exceed the 1931 all-time record.



LARGE DRAGLINE excavators were common sights in Bermuda during 1941 as U.S. army engineers filled swamps, cleared land and blasted rock to prepare the leased air bases there

Exports, chiefly cut flowers, lily bulbs and fresh vegetables, were £83,608 in 1940 (1939: £115,656). The disparity between exports and imports was accounted for by tourist expenditures and, during 1940 and 1941, by military and naval outlays in connection with war operations. In 1940, 25,521 tourists visited Bermuda, less than a third of the prewar average, including 10,200 from the United States, 1,800 from Great Britain, and 12,932, chiefly North Americans, on cruise ships.

Communication.—Bermuda is a main station on the Pan American Airways transatlantic route.

Under normal conditions it has frequent, regular steamship communication with the United States, Canada and Europe.

BIBLIOGRAPHY.—*West Indies Year Book, 1941–42; The Bermudian* (Hamilton, monthly); *Canada-West Indies Magazine* (Montreal, monthly); *Crown Colonist* (London, monthly); *West India Committee Circular* (London, fortnightly). (L. W. BE.)

Bertrand, Louis (1866–1941), French author, was born March 20 at Spincourt (Meuse). He was received into the French Academy in 1925 and was renowned as a novelist, historian and historical biographer. Among his later works were *Carthage* (1930), *Les Martyrs Africains* (1930), *Le Roman de la Conquête* (1931), *Histoire d'Espagne* (1932) and *Le Livre de Consolation* (1934). Bertrand died at his villa in Cap d'Antibes, Dec. 6. (See *Encyclopædia Britannica.*)

Beryllium. Demand for beryllium increased substantially in 1940, the most important of the products being copper alloys with 1·75–2·25% Be. The master alloy with 4% Be was quoted throughout the year at $15 per pound of contained Be. Early in 1941 it was announced that plant facilities were being installed for the commercial production of master alloys with nickel, containing 10%, 15% and 20% Be, using powder metallurgy.

Imports of beryl into the United States rose to 805 short tons in 1940, 422 tons from Argentina, 377 tons from Brazil and 6 tons from South Africa.

Future production of beryl in Argentina will be treated in a local plant to produce a mixed oxide and carbonate containing 80% BeO, which will be shipped to the United States of America in brick form. Trade treaty negotiations included a proposed reduction of the normal United States imports duty of 25%.

There had been two attempts to exploit beryl deposits in Canada, one in Ontario and one in Manitoba, but no late information was at hand on progress. (G. A. RO.)

Bevin, Ernest (1884–), British labour leader and statesman. In his youth he was a truck driver in the vicinity of Bristol; later he became interested in trade unions and was elected general secretary of the Transport and General Workers' union. In 1937 he was appointed chairman of the General Council of Trades Union congress. On May 13, 1940 Churchill named him minister of labour and national service, and he was promoted to the war cabinet on Oct. 3. In these offices he showed great energy in helping to stiffen Britain's war effort by securing the collaboration of the working classes.

When the government set up three "executive" groups for production, imports and postwar policy Jan. 6, 1941, Bevin was assigned to head the production division. This appointment was apparently designed to bring labour and employers closer into a joint war effort.

Throughout the rest of the year Bevin spoke, wrote and worked to speed up production. In July he announced the formation of joint labour-employer boards in war industries. In November he warned that wartime shortages in Britain demanded drastic measures, including the drafting of 1,000,000 married women to work in munitions factories.

Bibesco, Prince Georges Valentin (1880–1941), Rumanian aeronautical pioneer, was born April 23 in Bucharest, a descendant of Napoleon and grandson of a Walachian prince. He developed an enthusiasm for aviation after meeting Wilbur Wright at Le Mans, France, in 1908. The following year he received his aeroplane licence, the 20th international licence issued, and he became a pilot for Louis Bleriot. He then returned to Rumania, where he became commander in chief of the Rumanian air force during the Balkan war of 1913. In 1930 he was elected president of the International Aeronautical federation.

The federation received word on July 3 that Prince Bibesco had died in Bucharest.

Biddle, Francis (1886–), U.S. politician, 58th attorney general of the U.S. and great-great-grandson of Edmund Randolph, the first U.S. attorney general, was born May 9 in Paris. A scion of the Philadelphia Biddles, he attended Groton and then Harvard, where he received his law degree *cum laude* in 1911. After spending a year as private secretary to Oliver Wendell Holmes, supreme court justice, he was admitted to the Pennsylvania bar in 1912. He then ventured into politics, stumped for Theodore Roosevelt in the 1912 and 1916 campaigns, and ran, unsuccessfully, for the senate in 1914. He was special assistant

U.S. attorney in eastern Pennsylvania, 1922–26. An ardent New Dealer, he was appointed chairman of the National Labor Relations board in 1934. In 1938–39, he was chief counsel for the joint congressional committee investigating the Tennessee Valley authority. He was judge of the third U.S. circuit court of appeals, 1939–40, and was called from that post to become acting attorney general in June 1941 and was appointed attorney general by Pres. Roosevelt on Aug. 25, 1941. A staunch defender of civil liberties, Biddle frequently warned against mob hysteria in fighting the fifth column peril in the U.S., adding that aliens should be treated without "malice or race hatred."

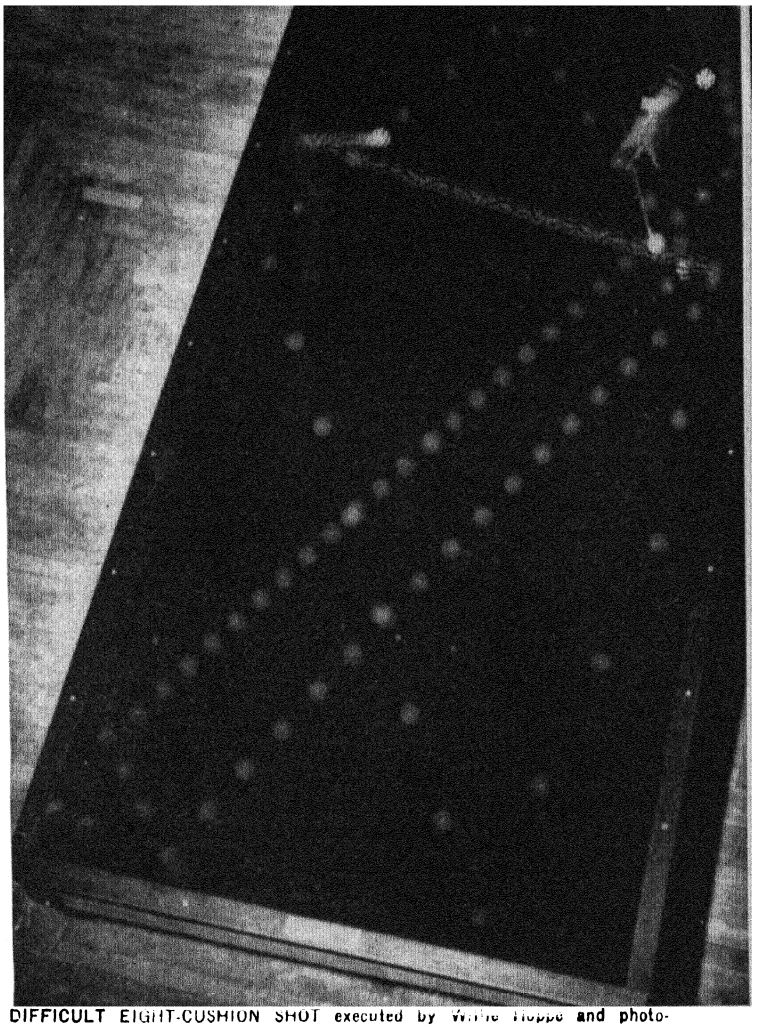
Biggers, John David (1888–), U.S. industrialist was born Dec. 19 at St. Louis and was educated at Washington university in that city and at the University of Michigan, where he received his bachelor's degree in 1909. After several years (1910–14) with the Detroit board of commerce and the Toledo, O., chamber of commerce, he became assistant treasurer of the Owens Bottle company at Toledo, and had advanced to vice president by 1926, when he also became managing director of Dodge Brothers of Britain, Ltd., in London. In 1930 he was named president of the Libbey-Owens-Ford Glass company in Toledo. In 1937–38 he directed the U.S. census of unemployment. Biggers was named deputy commissioner under William S. Knudsen (*q.v.*) on the U.S. Council of National Defense June 5, 1940. His special concern was industrial production for armaments. When the Office of Production Management (*q.v.*) was created by President Roosevelt Jan. 7, 1941, Biggers became executive director of the production division.

Biggers left the OPM late in Aug. 1941 to become U.S. minister to London. He arrived there Sept. 12 and during the next few weeks devoted himself to problems of production in connection with the lend-lease program. On Oct. 17 he returned to the United States, and on Oct. 30 President Roosevelt granted him a leave of absence to return to his position with the Libbey-Owens-Ford company.

Billiards. Once again the name Willie Hoppe led the billiard world as the veteran New Yorker successfully defended the three-cushion championship against a star-studded field at Chicago. While engaging Jake Schaefer in a challenge match on the eve of the tournament, Hoppe was stricken with pneumonia. He collapsed at the table and was rushed to a hospital, where his life hung in the balance. Overcoming the illness, Hoppe's start in the competition was delayed 16 days—he went into action and won 13 games in a row before losing to Welker Cochran. It will be recalled that in 1940 Hoppe won the title with the unprecedented string of 20 straight victories, so he made it 33 in a row before bowing; and concluded with a record of 36 out of 37.

A new rule, designed to eliminate safety play and speed up the game, was adopted during 1941 by the National Billiard association, the governing body of the sport. In the future a player will have a choice of starting with either white ball at the beginning of each half-inning. The old rule was in effect in the Chicago tournament.

In pocket billiards, a new ruler ascended to the throne in the person of Erwin Rudolph, 47-year-old expert from Cleveland, Ohio. Rudolph has held the crown four different times. His victory was at Philadelphia, Pa., where the round-robin competition was staged over a three-week period. At the completion of the regularly scheduled matches Rudolph, Irving Crane of Livonia, N.Y., and Willie Mosconi of Philadelphia, the defender, were deadlocked. In the three-cornered play-off, Rudolph gained the laurels by taking the measure of Crane in the final. (L. Ef.)



DIFFICULT EIGHT-CUSHION SHOT executed by Willie Hoppe and photographed in 1941 with a repetitive-flash camera

Biochemistry. Outstanding advances during 1941 concerned enzymes, vitamins, hormones and metabolism.

Enzymes.—A new enzyme, cytochrome C reductase, was separated in a partially purified form. The substance is a flavoprotein and is a necessary intermediate catalyst in the oxidation reduction chain between hexose monophosphate and cytochrome C. Another new enzyme, cytochrome C peroxidase, contains haemin and specifically catalyzes the decomposition of hydrogen peroxide by cytochrome C.

Vitamins.—Remarkable advances were made in the knowledge of the chemistry of biotin and its action. Biotin is the same as vitamin H (anti-egg white factor) and coenzyme R. This is another illustration of the interlocking of enzymes and vitamins. In other words, the action of biotin in stimulating yeast or mammalian growth is as a coenzyme in metabolism. Although biotin was obtained in crystalline form its actual structure was not determined. It probably is a monocarboxylic acid containing sulphur and a cyclic urea structure. The antagonistic action of egg white to biotin is due to the chemical combination of biotin with avidin, the harmful ingredient from egg white. The combination of biotin with avidin is physiologically inactive, but the biotin activity can be regenerated by hydrolyzing in an autoclave. A new factor, follic acid, of importance in yeast nutrition, was separated in pure form from leaves. Inositol, an isomer of glucose, and widely distributed in nature, previously found to be of value in yeast nutrition, was recognized as the specific anti-alopecia factor for mice.

Use of Tracers or Labelled Atoms in Studying Metabolism.—The exact identities of the precursors of creatine were finally definitely proved to be arginine and glycine by feeding these amino acids containing isotopic nitrogen to rats. The amidine group of the arginine is definitely involved. Choline nitrogen is not involved, but the methyl groups in choline are. The long accepted view that carbon dioxide is utilized in the synthesis of urea in the mammalian liver was confirmed by showing that radioactive or isotopic carbon supplied as bicarbonate leads to the formation of urea containing these forms of carbon. More surprising was the discovery that animal tissues might utilize some carbon dioxide in intermediate carbohydrate metabolism. It was shown that bicarbonate containing radioactive carbon when supplied to the proper system of tissue and substrate or to rats in the proper nutritional condition led to the formation of carbohydrate or degradation products thereof containing labelled carbon. The very rapid synthesis of radioactive thyroxine by thyroid tissue was shown by injecting radioactive iodine into rats.

Studies on the Production of Fatty Livers.—The previously observed production of fatty livers in young animals kept on a high fat, low protein

diet, free from or very low in choline content, was confirmed. The addition of adequate choline to the diet prevents the development of fatty livers. The methyl groups essential for the choline formation or action may also be supplied by methionine, an amino acid containing one methyl group attached to sulphur. The transfer of methyl groups from methionine to choline in the synthesis of the latter in these studies was established by feeding methionine containing deuterium in its methyl groups and recovering the deuterium in part in the choline.

Fatty livers are also produced in rats kept on a fat-free diet containing ample vitamin B complex from liver, or as a substitute, a synthetic mixture of pure thiamin chloride, riboflavin, pantothenic acid, pyridoxine and biotin. From these studies it was concluded that biotin appears to be the main causative agent. Egg white inositol or lipocaic concentrates (from pancreas tissue), but not choline, inhibit this action of biotin. The fact that adrenalectomized rats poisoned by phosphorus and maintained by adequate salt intake on a high fat and low protein diet did not develop fatty livers unless they were also treated with a suprarenal cortex preparation might prove to be of significance in the endocrine control of metabolism. That the suprarenal glands are involved in intermediary metabolism was also indicated by the decreased rate of deamination of amino acids by kidney tissue from adrenalectomized rats.

Hormones.—Fractionation and purification studies on the hormones of the pituitary gland in 1941 led to the revival of an old hypothesis, viz., that the blood pressure raising (pressor) and uterine muscle contracting (oxytocic) activities are represented by one large protein molecule. However, other workers gave good evidence to the contrary; that is, that these two activities can be separated almost quantitatively by mild chemical and physical treatments. The evidence indicated that the two activities are represented by two easily separated substances of similar physical but different biological properties or that a hypothetical giant molecule is easily separated by mild chemical treatment into the two active components. Birdseye, Claude Hale (1878–1941), U.S. topographic engineer, was born Feb. 13 at Syracuse, N.Y. On graduating from Oberlin college in 1901, he took a teaching post at the University of Cincinnati. He later became topographer for the U.S. geological survey and then surveyor for the general land office. From 1932 until his death, he was assistant to the director of the geological survey. Among his outstanding achievements were the mapping of the Kilauea volcano region in Hawaii in 1912, the surveying and mapping of the summit of Mt. Rainier in 1913 and a survey of the Colorado river from Lee's Ferry, Ariz., to the mouth of the canyon in 1923. He was decorated by the French government in 1919 and won the Daly medal of the American Geographical society in 1924. He was a colonel engineer of the Officers' Reserve corps at the time of his death in Washington, D.C., May 30.

Birth Control. The world picture abroad was dark and confused during 1941. Except for Sweden, information on clinical service on the birth control movement in other countries in Europe could not be obtained. Constant and relentless pressure on the conquered nations, food rationing and requisition by Germany of supplies from every country overrun resulted in lowered birth rates.

This form of birth control is dysgenic in the extreme; but no sane population policy could be adopted as long as Germany dominated Europe, and until world reconstruction programs included, as one essential for enduring peace, a consideration of the need for solving problems of overpopulation in relation to national resources.

Australia.—Vital statistics for Australia showed a slight rise in the birth rate of 1941 over that of 1940, and a sharp increase in the number of marriages, with their rate, 11.8 per 1,000 population, the highest on record. Established birth control clinics continued their work.

Cuba.—Efforts to establish birth control centres in the island were stimulated by lectures before the Gynecological association of the island, and publication of a new illustrated pamphlet on contraceptive technique, by a leading gynaecologist, received wide circulation among the medical profession.

England.—Branch clinics of the Family Planning association in the worst bombed areas of the provinces had extraordinary escapes from serious damage and were carrying on at the close of 1941. Some of the centres in or near London and the southeastern districts were temporarily suspended. Headquarters of the association were evacuated to Bournemouth late in 1940, with a small staff at the London office.

France.—Adoption of more drastic regulations against birth control and abortion failed to stem the fall in France's birth rate, nor has increase in family allowances had any such result. Food rationing resulted in a drop in the average weight of infants born and Germany's failure to release the 1,500,000 French prisoners held outside France tended to further reduce the birth rate.

Germany.—Germany endeavoured to raise its marriage rate by allowing soldiers at the front in any country to marry by proxy. Illegitimate births were officially stimulated and encouraged. In spite of all regulations against the sale of contraceptives, sales continued. Live births in the reich were reported increasing, but figures were contrasted with those of 1939. Civil statistics for the first quarter of 1941 showed them to be 24.5% less than in the corresponding quarter of 1940, however.

India.—Progress in organization of birth control work was reported to the Family Planning association by its organizer in that country. The last census in 1940 credited India with a population of 400,000,000, an increase of 18% in 10 years.

Japan.—By official decree a higher birth rate was ordered in Japan in 1941. The objectives are a perpetual population increase, so that other nations can be outrivalled in quantity and rate of increase, and industry and military manpower maintained. Birth control was rigorously suppressed, but in spite of this and of threats and inducements, the birth rate did not go up as fast as expected. Infant mortality rates, however, increased, and malnutrition was prevalent.

New Zealand.—The Family Planning association stimulated the passage at many meetings of a resolution asking the dean of the medical school of Otago university, the only medical school in New Zealand, to include a course in contraceptive technique in training the students there.

Norway.—All Norwegian birth control centres were closed by the police, following German occupation of the country.

Sweden.—The Swedish Society for Sexual Enlightenment continued work during the year and its Stockholm Birth Control clinic advised many women. The society collected funds to open a home for deserted mothers and provide relief for them.

Puerto Rico.—There was a steady increase in the number of clinic services under the direction of the Association Pro Salud Maternal e Infantil de Puerto Rico. These services were medically directed, and research studies on them were being undertaken to determine rates of effectiveness and acceptability of the methods advised. An interdepartmental committee appointed by President Roosevelt to survey Puerto Rico reported that overpopulation was the greatest problem of the island and that "birth control should be made a major function of the Insular Department of Health, as the key to the entire health situation in Puerto Rico."

United States.—*Population.* Final figures of the 1940 census showed an increase of almost 9,000,000 during the decade, in spite of ten years of depression and the lowest marriage rates in many years. Both marriage and birth rates rose in 1941 and forecast was for a birth rate of 18.5 for the year. Number of family units in the country increased 16.6% during the decade, though the average number of persons declined slightly.

Birth Control Federation of America, Inc.—Thirty-four state organizations were affiliated with the federation in 1941. The year was one of marked progress and increased public support.

On Oct. 16, simultaneous anniversary observances were held in 32 cities throughout the U.S., commemorating the 25th anniversary of the founding of America's first birth control clinic by Margaret Sanger in Brooklyn in 1916, which was closed as a "public nuisance." Numerous articles in the lay and medical press commented on the growth of clinic service and the increasing recognition by public health agencies of the importance of contraceptive service in their own programs.

Alabama followed North and South Carolina as the third state to include birth control officially in its public health program, and reports on the programs in these states were requested by many public health officials in other states.

Field work of the federation was concentrated in the south where population studies indicated the greatest need for a program of family spacing, where infant and maternal mortality rates are highest, and where high fertility and poverty make living conditions most difficult. Prominent citizens of the south held a Third Southern Conference on Tomorrow's Children and formulated a practical program of action.

Clinical Service.—Birth control centres in the United States totalled 637 in Nov. 1941. Of these 118 were in hospitals, 206 in health departments and 313 in other quarters, while 283 were supported wholly or in part by public funds. More than 90% of public health officers answering a ques-

tionnaire stated they were in favour of using federal funds for such service.

Legislation.—Connecticut: A bill to amend the law and give doctors the right to advise patients on contraception, when medically indicated, passed the house but was defeated in the senate.

Massachusetts: An initiative petition signed by more than 44,000 voters was presented to the legislature in the form of a bill. After a hearing, the bill was referred by the legislature to the state supreme court, for an opinion on its constitutionality, the opposition claiming that a religious issue was involved. The court ruled that the bill was purely permissive and that no religious issue was a factor in the bill. The bill was later defeated by both houses. The necessary thousands of additional signatures were secured to put the question on the ballot in 1942. The opposition, led by Cardinal O'Connell of Boston, attempted to challenge the legality of the petition and prevent inclusion of the question on the ballot.

Legal.—The federal trade commission's action against falsely advertised or dangerous contraceptives continued, but trade in bootleg materials went on in spite of "cease and desist" orders and suit.

Medical Education was fostered by the distribution of more than 50,000 copies of a new pamphlet, "Techniques of Conception Control," by Robert L. Dickinson, M.D., and Woodbridge E. Morris, M.D., among medical schools, state and county medical societies, public health departments, hospitals, medical libraries and individual physicians. More than one-fourth of the leading medical schools of the U.S. were visited by a medical representative of the federation, resulting in the inclusion of contraception in some programs, and in others an increase in the time allotted to the subject of contraception. (*See* also CIVIL LIBERTY.) (M. SR.)

Birth Statistics. According to final reports there were 2,360,399 live births in the United States in 1940, with a corresponding birth rate of 17·9 per 1,000 total population. For the same year, England and Wales reported 607,131 births, and its birth rate was 14·6 per 1,000; Canada had 243,835 births with a birth rate of 21·4 per 1,000. A comparison of the birth rates in these countries for the first six months of 1941 with the corresponding period of 1940 shows an increase of 4·6% for 42 states in the United States and of 13% for 67 cities and towns of Canada. On the other hand, the great towns of England and Wales, including London, experienced a decrease of 21·2% in number of births from 1940 to 1941 over a period of comparison extending from January through August of each year. While the falling off in the birth rate in England and Wales may be attributed to wartime disruptions of normal family life, the rise in the United States and Canada may be associated with the general improvement in economic conditions and with an increase in marriage in 1939, perhaps, in part, in anticipation of draft laws and military service. Birth rates for the principal English-speaking countries for each year since 1921 are shown in the appended table.

Annual Birth Rates per 1,000 Total Population in the Principal English-speaking Countries, from 1921 to 1940

Year	United States	Canada	England and Wales	Scotland	Northern Ireland	Eire	Australia	New Zealand*	Union of South Africa (whites)
1921	24.2	29.4	22.4	25.2	23.6	19.7	21.9	23.4	28.4
1922	22.3	28.4	20.4	23.5	23.3	19.5	24.7	23.2	27.5

*Europeans excluding Maoris.

Birth rates in the United States are usually highest in the south and southwest and lowest in the northeast. Thus in 1940 New Mexico had 27·7 births per 1,000 population; Utah, 24·6; Mississippi, 24·1; and Arizona, 23·5. In the northeast, New Jersey had a birth rate of 14·1 per 1,000; New York, 14·6; Connecticut, 14·7; and Rhode Island, 15·1.

Among cities having 100,000 or more inhabitants according to the census of 1940, those recording the highest birth rates per 1,000 population were Camden, N.J., 29·6; Youngstown, O., 28·8; Peoria, Ill., 28·6; Salt Lake City, Utah, 28·3; and Sacramento, Calif., 27·6. The lowest birth rates per 1,000 were found in Reading, Pa., 12·0; Somerville, Mass., 12·7 (for 1939); Yonkers, N.Y., 13·4; San Francisco, Calif., 14·0; and New York city, 14·2.

There are two factors that may influence the birth rate of a community as usually reported. In the first place, it is to be expected that, other things being equal, the community with the higher proportion of its population within the reproductive ages will record the higher birth rate. Secondly, the presence of ample hospital facilities in large communities usually attracts cases for confinement from outlying districts.

The second of the foregoing considerations is particularly important in the interpretation of birth rates for urban and rural areas. For example, according to official vital statistics reports, rural districts of the United States in 1940 had a birth rate of 16·3 per 1,000, while for cities of 10,000 to 100,000 inhabitants, it was 21·8 and cities of 100,000 or more had a rate of 18·2. However, it is found on examining the completed records for 1938 (the latest for which the requisite data are available), that 17·2% of the births in cities of 100,000 or more were of nonresidents, cities of 10,000 to 100,000 had 31·2% nonresident births, and rural districts and cities of less than 10,000 had 8·9%.

Nearly all births in the United States are attended by either physicians or midwives. In 1940 nine out of every ten births received medical care, more than half of them in hospitals. Less than 10% of the births were attended by midwives and only one-half of 1% received no such attention. In urban areas, 98% of the births had medical attention, compared with 82·8% in rural areas. For the country as a whole, 96·4% of the white births were attended by physicians, while among the Negroes, the figure was 50·8%.

To compensate for this disadvantage, attendance by midwives in the case of Negro births was much more frequent than among white births.

There is a fairly definite geographic pattern in the extent to which medical attendance at birth varies within the United States. High percentages are usual in most of the northern and western states, while the smallest proportions of births attended by physicians are found in the south. Thus in 1939 the latest year of record, all births in Maine received medical attention; altogether, 20 states had 99% or more of their births attended by physicians. Although Mississippi was lowest on this list with 50·6% of births attended by physicians, it had 48·9% of its births attended by midwives, so that practically all confinements there had some professional care.

Reproductivity among American women is at a peak in the age group 20 to 24 years. Thus the birth records for 1939 indicating the number of cases of live births (counting twin births or triplets as a single case), according to the age of the mother, were: 48 per 1,000 women of all marital states of ages 15 to 19 years; 119 per 1,000 of ages 20 to 24 years; 109 at ages 25 to 29; 74 at ages 30 to 34; 41 at ages 35–39; and 14 at ages 40 to 44. (*See* also CENSUS, 1940.)

Bismuth. Although no production figures are published, the United States is known to be the world's largest producer of bismuth, followed by Peru, Mexico and Canada, with minor amounts from several other countries. World production is estimated to be about 1,500 metric tons, of which the United States contributes nearly one-half. The output of Peru was 383 tons and of Mexico 185 tons in 1940, while Canada was probably somewhat higher than Mexico. (*See* also METALLURGY.)

(G. A. Ro.)

Blackouts: *see* PHOTOGRAPHY: *Blackout Bulbs;* MUNICIPAL GOVERNMENT.

Blackton. James Stuart (1875–1941), U.S. pioneer film producer, was born Jan. 5 in Sheffield, England, and went to the United States in his youth. After a brief career as a reporter and a painter, he became interested in motion pictures, and, together with a partner, he launched the Vitagraph company in 1896. Blackton produced many notable films of the silent screen era, among them *The Christian* and *The Battle Cry of Peace.* In 1925 he sold the Vitagraph company to Warner Brothers for a sum reported to be in excess of $1,000,000. He was wiped out, however, in the depression and in 1935 he became director of a federal work relief movie project. He died in Hollywood, Calif., Aug. 13.

Bloch, Claude Charles (1878–), U.S. naval officer, was born July 12 in Woodbury, Ky., the son of a Czechoslovak immigrant. After graduating from the naval academy in 1899, he served under "Fighting Bob" Evans in the Spanish-American War and was cited for rescuing Spaniards from the burning ships of Adm. Cervera's fleet. He saw service in the Philippines and in the Boxer rebellion. In 1918 he escorted troopships and merchantmen through Atlantic war zones to European ports. He was made a captain in 1921 and became chief of the navy ordnance bureau in Washington, 1923, commandant of the Washington navy yard, 1930, and commander of a training squadron scouting force, 1931. In 1936 he was commander of the battle force with the rank of admiral, and he was named commander in chief of the U.S. fleet in 1938. This office he retained until Jan. 6, 1940, when he was sent to Pearl Harbor as commandant of the 14th naval district. He was stationed at this post during the Japanese raid of Dec. 7, 1941.

Block, Paul (1877–1941), U.S. newspaper publisher, was born Nov. 2 in Elmira, N.Y. After studying at Cornell university, he returned to Elmira where he became an advertising solicitor for a newspaper. Two years later he went to New York city and there established his own newspaper advertising agency in 1897. Branching out in the publishing field, Block bought a number of newspapers on his own account, but later sold them to the Hearst chain. The Block chain was never very extensive and at his death consisted of only three newspapers, one in Pittsburgh and two in Toledo. Block was a virulent critic of President Roosevelt and the New Deal. In 1937, when the president named Senator Hugo Black to the supreme court, Block sent one of his Pittsburgh reporters to Alabama to investigate Justice Black's past links with the Ku Klux Klan. The ensuing "exposé" was hailed as a journalistic coup.

He died in New York city, June 22.

Blockade. It was believed that the maritime blockade* as effected by sea and air power in the Atlantic, the Mediterranean and the Pacific would be one of the major determinants of the outcome of World War II. The blockade of 1939, 1940 and 1941 had to a considerable degree pinched the civilian and military life of the axis. Although the war might be long and costly, so long as the British and United States fleets with Russian and Allied land power exerted the necessary pressure to deny access to raw materials and foodstuffs needed by the axis, it would not be possible for Germany, Japan and Italy to win.

Blockade is, in its generally accepted usage, the process by which a belligerent controls the ingress and egress of sea-borne trade to another belligerent. The interruption of communications subjects a belligerent to a severe stress of its general population as well as of its army and navy. Blockade concerns the interruption or stopping of sea communications and is a maritime method of war. A land blockade is enforced by direct control of bases, frontiers and physical occupation of bases. The status of the aeroplane and blockade was not clear in 1941.

Blockade may involve the control of neutral ships bound for neutral ports wherein the doctrine of "ultimate destination," "ultimate consumption" or even "substitution" may be involved in the case of contraband. For a discussion of these theories and principles one should consult the standard authorities on international law. Suffice it to say that a blockade is not binding unless it is rendered effective by force. In short, a "paper blockade" or a blockade that is ineffective is invalid according to the law of nations. "There is no such thing," says Stowell, "as a legitimate blockade of neutral ports and territories."

International law relative to submarine warfare was disregarded by Germany in 1914–18. Again in 1940 and 1941 the axis powers resorted to a ruthless submarine warfare with the indiscriminate laying of magnetic mines for the purpose of breaking Britain's blockade of the axis-controlled territory. This unilateral concept of total war scorned most international rules of war and treaty obligations as evidenced by Germany's unprovoked attacks on surrounding states and the treacherous Japanese attack on the U.S. fleet at Pearl Harbor, Dec. 7, 1941. This was then followed by bombing attacks on Manila and Singapore that killed many civilians, women and children. International law had no place in axis practices.

The fact that a blockade exists is generally promulgated by the blockader. A breach of blockade is usually followed by the capture and condemnation of a vessel and its cargo.

"It is agreed," writes the authority Hall, "that for a maritime blockade to be duly set up and maintained:

1. The belligerent must intend to institute it as a distinct and substantive measure of war, and his intention must have in some way been brought to the knowledge of the neutrals affected.
2. It must have been initiated under sufficient authority.
3. It must be maintained by sufficient and properly disposed force."

By this definition it is clear that contraband cargo, rights of visit and search, and seizure are closely associated with the practice of blockade.

In the days of sail and limited gun ranges, the sea blockade was maintained by a close blockade. This was particularly true in the wars of Great Britain against the French revolutionary governments and the French empire. To a degree the blockade was "close" in the Civil War when the federal navy by preventing the Confederacy from engaging in sea-borne commerce or receiving supplies, hastened the peace. British sea power in 1914–18 maintained such an effective sea blockade that despite Germany's desperate attempt to break the cordon of steel by submarine warfare, the population of the Central Powers was brought close to complete starvation. In 1941 the British fleet plus units of the United States navy had the enormous task of maintaining a blockade of practically all the continent of Europe and escorting vessels to the

*All assertions or opinions contained in the above article are the private ones of the writer and are not to be construed as official or reflecting the views of the navy department or the service at large.

British Isles through the counterblockade maintained in the Atlantic by the axis. Great Britain and the United States were transporting war materials and foodstuffs to the British Isles and the Suez canal area in the face of aggressive submarine warfare and aerial opposition on the part of Germany and Italy with axis bases in Norway, Denmark, Holland, France, Italy, Greece and northern Africa.

In its modern operation, a blockade is usually a "long range" one. This natural evolution of the blockade resulted from the advent of the mine, long-range shore batteries, the submarine, the aeroplane and the torpedo. The tactical or close blockade was seriously questioned as to its effectiveness after the Russo-Japanese War when Admiral Togo in front of Port Arthur lost two battleships by mines. This was one-third of the major force of the Japanese and compelled Togo to relinquish his grip on the port. The first large-scale example of the long-range blockade was that instituted by the royal navy from 1914 to 1918. This pattern, with modifications resulting from ever-changing conditions, was followed by the British in 1939–40 and '41. Cruisers, auxiliary cruisers and some major ships patrolled the seas at a distance of 500 mi. or more from shore while destroyers, submarines, motor torpedo boats and aircraft struck at coastal shipping, troop transports and axis men-of-war inshore. Trade from the Atlantic to the continent was practically nonexistent.

Germany and Italy had by a counterblockade, or in their interpretation of a blockade, attempted to sink all vessels carrying supplies of whatsoever nature to the British Isles or British possessions. To a degree, the axis was successful and until the United States navy was employed to augment the British fleet in the patrol of the north Atlantic and to escort shipping, the losses in merchant tonnage were alarming. Other factors also tended to effect this decrease in merchant tonnage. Secretary of the Navy Knox reported in Dec. 1941 that 14 German submarines were sunk or damaged by U.S. ships since the north Atlantic patrol was instituted.

The total of British, Allied and neutral ship losses from the beginning of the war until Dec. 1941 was more than 8,000,000 tons. The British claimed about 4,000,000 tons for axis losses of ships captured, sunk, seized or scuttled. In April 1941, British-Allied-neutral losses were at a high—597,193 tons.

British sea power commenced to exert its economic pressure on Germany at the very outbreak of World War II by a blockade that was defined as, "an act of war carried out by warships of a belligerent detailed to prevent access to or departure from a defined part of the enemy's coast." To maintain this blockade was the most difficult task that the royal navy had ever faced in its long history because of the advent of air power and the decided superiority of the nazis in this effective, fast, long-range weapon of war. Planes became the eyes of the submarine and gave the underwater weapon vital information on convoys and surface disposition of men-of-war. For years the royal navy, operating from the British Isles, had dominated the communications of the North sea, the English channel and the French coast, but with the fall of Norway, Denmark, the Low Countries and France the situation was radically changed. The disposition of the royal navy was also affected by the threat of an invasion of the British Isles, a possibility that had not been seriously considered since Napoleon's abortive attempt.

The royal navy went to stations on Sept. 3, 1939. A formal blockade was not declared but instead a proclamation of lists of contraband was made that covered practically all imports to Germany. As used in 1914 and today, blockade implies a major method of economic warfare. On Sept. 9, 1939, the British government stated that, "to prevent contraband from reaching the enemy, His Majesty's government will use their belligerent rights

IT ALL DEPENDS on which end you look through, decided Seibel of the *Richmond Times-Dispatch* in recording "Another Controversy" of 1941

to the full." The term "long distance economic blockade" is rather loosely used as meaning: all methods of stopping all supplies or trade to a belligerent. Economic warfare, aside from the physical disposition of ships in a blockade, requires highly organized machinery. In modern warfare it is exceedingly dangerous to stop merchant ships for visit and search on the high seas because of the danger of submarine or air attack. This necessitates that ships suspected of carrying contraband or of being in enemy service be sent to certain control ports for careful inspection.

The axis counterblockade required many British and American men-of-war for patrol, escort and convoy duty. With the exception of some raiders, few German or Italian surface men-of-war were at sea. The royal navy was in 1941 much occupied in cutting the sea lanes of Italy to northern Africa and at the same time fought to keep its own sea lanes open to the Suez canal and the empire of the east. Italy lost more than one-half of its effective sea power in these operations. It was believed that because of the British sea blockade as well as the loss of the fascist African empire of Ethiopia and Libya, Italy would be the first of the axis powers to collapse. The blockade was beginning to affect seriously Italy's ability to keep its ships in fuel and oil, make necessary repairs as well as secure much-needed raw materials. The blockade worked a great hardship on the Italian people. Military and naval morale was low. There was food for those who paid bootleg prices and it was reported that the German "observers" there usually had money and bought in large quantities. In Sept. 1941 there were 7,554 cases of bootlegging, hoarding and other offences violating the economic laws; and of these offences there were 6,592 convictions. Because of the relentless blockade food rationing was broadened to include all types of meats, including entrails.

The president of the United States in a radio address on Sept. 11, 1941, enunciated and to some extent extended the traditional American concept of "freedom of the seas." With a realization that Germany, by ruthless north Atlantic submarine warfare, was making serious inroads on American raw materials and the manufactured products carried in British bottoms, the president said:

> The time for active defense is now. . . . This is the time for prevention of attack. . . . In the waters which we deem necessary for our defense, American naval vessels and naval planes will no longer wait until axis submarines lurking under the surface of the water or axis raiders on the surface of the sea strike their deadly blows first.
>
> Upon our naval and air patrol—now operating in large numbers over a large expanse of the Atlantic ocean—falls the duty of maintaining the American policy of freedom of the seas—now. That means very simply and clearly that your patrolling vessels and planes will protect not only American merchant ships but ships of any flag—engaged in commerce in our defense waters.

This policy and the effective measures that followed struck a serious blow to Hitler's great hope of victory by nazi counter-blockade in the north Atlantic ocean. The British, who must import about one-fourth of all foodstuffs and raw materials, were losing ships at an alarming rate. The positive U.S. naval support and protection of British shipping and United States shipping had at the end of the year greatly reduced the merchant ship losses.

With the entrance of the United States into World War II on Dec. 7, 1941, the effect of naval blockade became world-wide. Before the German attack on Russia there were four major leaks in the British blockade. The most important was from North Africa where Italy was maintaining a precarious line of communication and bringing over some foodstuffs and minerals for axis consumption. The second was the Trans-Siberian railway, whereby some Latin-American countries sent some minerals and fats. The third was the LATI air line out of Brazil, which carried securities, intelligence reports and a small amount of strategic materials, and the fourth was the railroad across Iran that brought information, securities and some supplies to Germany. At the end of Dec. 1941, all these routes were closed. The Italians admitted that they maintained with difficulty a precarious line of communication to Africa.

The Anglo-American blockade pinched nazi life even though Germany's leaders prepared diligently to meet the situation. Food rationing became effective on Aug. 28, 1939. This remained in effect, with a further cut of 20% in meat rationing in May 1941. There was a call throughout the winter of 1941 for warm clothes for the German army on the Russian front.

The curtailment of the imports of Australian and Argentine wool had its effect in spite of the reported German success in the production of *Zelwoole* or synthetic fibres. As far as wardrobes were concerned the nazis were making the most of their reserves. Germany was taking all the foodstuffs possible from the occupied countries of Europe.

Economic war with its police force—blockade—is one of the most decisive factors in modern warfare. To strangle an enemy comprises a twofold task: First, to prevent by every possible means delivery of and access to the raw and manufactured materials necessary for enemy war effort. Second, to maintain the flow of war materials and foodstuffs necessary for one's own war effort. As a rule, a superiority of air and sea power will achieve both missions. Great Britain had in World War II a minister of economic warfare who co-ordinated the world-wide effort of the empire by employing all British trade agents and officials around the globe. The United States recognized the efficacy of an "all out" economic warfare against the axis and Vice-President Wallace was charged with the activities in this field.

In preparation for war and fearful of a blockade, Japan for some years accumulated stock piles of strategic raw materials and oil reserves. After Japan moved into Indo-China all credits were frozen in the United States. This affected Japan's spinning, weaving, rayon, steel, copper, rubber and other industries. The licensing system then cut off the Nipponese silk trade as well as that of furs, bristles, canned fish, camphor, toys and other commodities, for which the United States was the best market. The U.S. was compelled to take this action against a palpable enemy. It was a form of economic blockade.

The Japanese thrust at the Philippines, Borneo, Malaya and the Dutch East Indies was for the purpose of securing oil, rubber and tin. If Allied sea and air power, with sufficient army strength, could prevent or hinder for a time the southward aggression it was believed by most experts that Japan would be unable to prosecute a major war for a long period. Without new territory and much-needed raw materials both the stock piles of Germany and Japan would run low. Blumenthal, George (1858–1941), U.S. banker and art collector, was born April 7 in Frankfurt-on-Main, Germany. He went to the United States in 1882 and became associated with a banking firm. After 32 years as a partner in the banking firm of Lazard Frères, he retired in 1925 to devote all his time to art and philanthropy. In 1928 he gave $1,000,000 to the Metropolitan Museum of Art in New York city, and his donations to the Mt. Sinai hospital, also in New York city, were said to have exceeded $2,000,000. Blumenthal also gave substantial contributions to French educational and medical institutions. In 1934 he was appointed president of the Metropolitan Museum of Art, a post he held until his death in New York city, June 26.

Board of Economic Warfare: *see* ECONOMIC WARFARE, BOARD OF.

Bock, Fedor von (1880–), German army officer, was born Dec. 3 at Kuestrin, near Berlin, and was educated at the Potsdam Military school. At the age of 17 he was assigned to an infantry guards regiment. He had advanced to a captaincy by the time of Germany's entry into World War I in 1914 and emerged from the war a major. In 1919 he became commander of the Peace army and in 1920 commander of the third army group, which post he retained for 18 years, until his appointment by Hitler as commander of the first army group in 1938. During the invasion of France in May and June 1940 he commanded the lower Somme army group. He was one of the 12 German generals created field marshals of the reich by Hitler on July 19, 1940.

In 1941 Hitler delegated to him command of the central German armies in the Russian campaign. Bock dealt the Russians some of their severest defeats in the early part of the campaign, notably at Bialystok and Minsk; also, later in the year, at Smolensk and Vyazma. He unleashed six separate major offensives against Moscow in the fall of 1941. The last, begun in November, fell short of its goal near Tula, Mozhaisk and Volokolamsk. Then Bock began his series of "orderly retreats" and "defensive actions." There were many reports at the end of the year that he had resigned, but none of them was confirmed in Berlin.

Bohemia and Moravia. A German protectorate in central Europe after March 16, 1939, formerly a part of Czechoslovakia. Area, 19,058 sq.mi. (Bohemia

12,525; Moravia 6,533); population, estimated about 7,000,000, of whom two-thirds are in Bohemia. Capital, Praha (Prague). Chief cities: Praha (848,823); Brno (264,925); Moravska Ostrava (125,347); Plzen (114,704); Olomouc (66,440). Religion: mainly Roman Catholic. President: Dr. Emil Hacha.

History.—Though the vast majority of the population is Czech and though a skeleton puppet administration exists for internal affairs, the administration of the country remained entirely in German hands in 1941. The Germans are not only exclusively responsible for the foreign affairs, the defense and the communications of the territory, but they manage also all its internal affairs. The protectorate formed, after Sept. 15, 1940, an integral part of the German Customs union and its whole economic life has been thoroughly co-ordinated with that of Germany. The process of Germanization was rapidly promoted by the occupation authorities. But the resentment of the Czech people grew as fast, and found its expression during 1941 in repeated acts of non-co-operation and direct sabotage. These acts represented the will of practically all classes and sections of the Czech nation. The pro-fascist group, called Vlajka, remained completely without any influence in spite of strong German backing. The great Czech national organizations, like the legionnaires of World War I, and especially the historically and numerically important gymnastic organization, Sokol, were dissolved.

The conflict between the Czechs and the "protector" came to its head at the end of September. The Reichsprotector, Baron Constantin von Neurath, was relieved of his duties and Reinhold Heydrich, the right-hand man of the chief of the gestapo, Heinrich Himmler, was appointed in his place. The prime minister of the autonomous Czech government, Gen. Alois Eliaš, was arrested and condemned to death for "preparing high treason." It is interesting that some of the men arrested and subsequently executed by the Germans were known as ardent "collaborationists," who like Gen. Eliaš had been appointed by the Germans to the offices. Among those executed, whose number amounted to many hundreds, were the mayor of Praha, Dr. Otto Klapka, Gen. Josef Bily, former army commander in Bohemia, Gen. Hugo Vojta, and several other high officers and officials, university professors and leading intellectuals, besides many men from all ranks and occupations. At the same time extreme measures were adopted against the Jews in Bohemia and Moravia; all their synagogues were closed and their deportation to eastern Poland ordered. The reprisals did not promote a better feeling on the part of the Czechs for the "new order." The hopes of practically all the Czechs were centred upon an American and Allied victory and upon the Czechoslovak government formed in London. (For activities of the government-in-exile during 1941, *see* CZECHOSLOVAKIA. *See* also RUTHENIA; SLOVAKIA.)

Bois, Elie-Joseph (1878–1941), French newspaper editor, was born Feb. 2 at Vichy, France. After working for provincial newspapers, M. Bois at 20 went to Paris, where he free-lanced for many journals. In 1908 he joined the staff of *Le Temps* and in early 1914 became editor-in-chief of *Le Petit Parisien*, which under his direction became one of the most widely read newspapers in France. After the collapse of France in June 1940, M. Bois fled to London, where he wrote a number of articles on the nazi conquest of his homeland. He died at his home in London, April 27.

Bolivia, a South American inland republic on the southern Andean plateau; area: 419,470 sq.mi.; pop. (1941 est.): 3,457,000; chief cities (with est. pop.): La Paz, the capital

"AN UNDIPLOMATIC EXIT!" Cartoon comment of Duffy in the *Baltimore Sun* upon the Bolivian declaration of July 19, 1941, that the German minister was *persona non grata*

(202,000); Oruro (45,000); Cochabamba (37,000); Potosí (35,000); Sucre (32,000). Religion: predominantly Roman Catholic. President in 1941: Gen. Enrique Peñaranda.

History.—During 1941, Bolivia continued to benefit superficially from wartime demands for its mineral production, above all, for tin and tungsten; but rapidly mounting living costs brought on extensive strikes and unrest. By executive decree of Aug. 22 a 5% to 30% salary increase was ordered throughout Bolivia, but continued price rises caused serious railway and other strikes in October. Agreements with the United States for purchase of 18,000 tons of tin annually for five years (initiated in 1940) and of 3,000 tons of tungsten annually for three years gave promise of more substantial prosperity, once internal readjustments were effected.

Meanwhile, Bolivia's role of producer of essential strategic war materials and its long-continued internal unrest made it a focal point of axis intrigues. Nazi propagandists were active. To combat them, the government expropriated the German-owned Lloyd Bolivian airline (May 14). Rumours of a nazi putsch were active in June, and the situation reached white heat with the disclosure in July of an extensive plot in which German Minister Ernst Wendler was the driving force. President Peñaranda then acted with energy and dispatch, expelling Wendler, proclaiming a state of siege and ordering the arrest of many oppositionists. Nevertheless, the situation remained delicate throughout 1941.

Relations with the United States centred about problems of hemisphere defense, to which Bolivia gave strong support. But these relations were complicated by the question of Standard Oil company petroleum properties expropriated in 1937. This problem remained unadjusted at the end of 1941, although negotiations

were reported to be progressing satisfactorily. An important tungsten contract with the United States was made in the face of a Japanese offer of considerably higher unit price. Upon Japan's entry into the Pacific war, Bolivia gave strong support to the United States, severing relations with Germany, Italy and declaring war on Japan.

In Jan. 1941, Bolivia took part in the first Río de la Plata regional conference, at Montevideo, and under agreements made there acquired important rights of transit and special preferential trade rights.

Education.—Bolivia had some 2,000 primary schools in 1941, with more than 150,000 enrolment, and three universities. The 1941 budget allotted 79,000,000 bolivianos, or 14.1%, to education.

Defense.—The standing army was estimated in 1941 to number 14,000, with a reserve of 75,000, and an air force of 60 planes. A U.S. military mission replaced the Italian mission, which had been in charge of training until Oct. 1941. More than 25% of the 1941 budget was allotted to defense (145,000,000 bolivianos).

Finance.—The monetary unit is the boliviano (value: approx. 2 cents U.S.). National revenues in 1940 totalled 599,768,000 bolivianos, expenditures 505,000,000 bolivianos (est.). Revenues, derived extensively from export duties on metals, rose sharply in 1941. The foreign debt, approximately $53,600,000, was in complete default in 1941.

Trade and Communication.—External communication is by rail to Chile, especially, and to Peru and Argentina, and by Pan American airways to all parts of America. Construction of sections of a 680-km. railway from Santa Cruz to Corumbá, Brazil (with an eventual connection from there to the Atlantic coast), and of a further link from Santa Cruz to Vila Vila, near Cochabamba, continued during 1941. Expected U.S. financial aid to cover the estimated $33,000,000 cost was held up in 1941, however, when United States engineers recommended substitution of a paralleling highway at one-fourth of the cost. A further railway extension from the Argentine border to Santa Cruz was being financed by the Argentine government under an agreement of Feb. 11, 1941. The railway mileage in 1941 was in excess of 2,229 km. The Bolivian highway system included almost 900 mi. of the Pan American highway and nearly 5,000 mi. of other roads, with considerable additional mileage under construction. An internal air line, German-controlled until May 1941, when it was taken over by the Bolivian government, provides the only regular communication with some important areas, however.

Bolivia is the world's second largest producer of tin, which accounts for some two-thirds of all export values (72% in 1940). Under the international tin quota, an annual export of 46,778 tons is allotted. Actual export in 1940 was 38,531 tons, with a value 12.8% greater than all exports in 1939. In Sept. 1941, some 4,100 tons were exported, and the 1941 total was expected to reach the international tin quota allotment of 46,778 tons. Tungsten (2,002 tons in 1940), antimony (10,060 tons), silver (175,000 kg.), zinc (12,197 tons), copper (4,056 tons), lead (14,111 tons), gold (336 kg.) and other minerals account for practically all the exports. In 1940 increases in both volume and value were as high as 57% and 207% over 1939. During 1941, not only were there further substantial increases in tin, tungsten, antimony and zinc, but large long-term tin and tungsten contracts with the United States promised continued high production levels.

Foreign trade (officially reported in £ sterling) totalled as follows: Exports, 1939: £8,888,777; 1940: £12,877,211; imports, 1939: £4,848,358; 1940 (1st half): £2,474,986. In 1939, 64.4% of exports went to Great Britain, 16.8% to Belgium, 9.1% to the United States; in 1940 practically all were taken by Great Britain and the United States. In the year ending Aug. 31, 1941 (the second war year), exports to the United States were valued at $19,730,000, more than 12 times the figure for the corresponding period in 1938–39. Imports are chiefly manufactured goods from the United States and foodstuffs from Peru and Argentina. Import values during 1941 closely approximated the 1939 and 1940 levels.

Mining is the dominant industry; agriculture and grazing are insufficient for domestic needs, as is manufacturing. (L. W. Be.)

Bonds: *see* Stocks and Bonds.

Bonine, Fred N. (1863–1941), U.S. eye specialist, was born Oct. 21 in Niles, Mich. He studied at Freiburg, Germany, was graduated from the University of Michigan and took postgraduate work in European universities. On returning to the United States, Dr. Bonine took up practice in his father's office at Niles and established an international reputation as an eye specialist. He was credited with saving the sight of Jack Dempsey when the famous fighter's eye affliction threatened his career. Dr. Bonine died in Niles, Aug. 22.

Book-collecting. The accent on modern literature continued to be stressed in contemporary bibliophily. The late A. Edward Newton was a bridge linking the old school with the new, having, as he did, a taste sufficiently catholic to include the Caroline poets and Christopher Morley. A composite portrait of the new-school collector would depict a man in his early 30's who is a university graduate and a successful executive, usually in a field not intimately related to the arts. His chief cultural concern is the literature of his own day, and he reads books as well as collects them. He has some, perhaps considerable, aesthetic appreciation of externalities, and is therefore likely to have a due regard for fine printing.

Bibliographical activity during 1941 inevitably continued to concern itself chiefly with American books. The new (fourth) edition of Merle Johnson's *American First Editions,* edited by Jacob Blanck, evidenced a higher degree of selectivity in this field. The last previous edition listed 199 authors; 23 of these were dropped and 11 new names added. Blanck's bibliography of Harry Castlemon (Charles Austin Fosdick) is an excellent affirmation of a continuing interest in American juveniles. Harry Dichter and Elliott Shapiro collaborated to provide badly needed assistance to collectors in a fascinating field and produced *Early American Sheet Music, 1768–1889.* Dr. Thomas Franklin Currier, associate librarian emeritus of the Harvard college-library, whose monumental bibliography of John Greenleaf Whittier (1937) marked a milestone in meticulous research, reconstructing the poet no less than his books, pushed toward completion a bibliography of Oliver Wendell Holmes which should represent a parallel achievement.

The activities of the Bibliographical Society of America continued to reflect the enthusiasm of its broadened membership base and wider outlook on the panorama of the printed book. Carroll A. Wilson, as chairman of the society's publication committee, had the task of supervising the activities of a group of eager explorers of the bibliographic field. Rollo G. Silver's *Directory of Nineteenth Century American Publishers* is a significant manifestation of this committee's capacity for achievement.

The first issues of *American Notes and Queries,* which made their appearance during 1941, indicated the lively interest of the new school in pursuit of bibliographical and related minutiae.

The traffic in imported items suffered, of course, as a consequence of the battle of the Atlantic, but not to so great an extent as might have been supposed. So far as can be ascertained, only a single important shipment of books, consigned to a large New England university, was lost as a result of enemy action.

Sales.—The dispersal of the great A. Edward Newton library was the most important event of the year. The 2,007 lots brought a total of $376,560. The high point of the sale was the Ouvry-Carysfort-Proby copy of the first folio Shakespeare (1623), which brought $22,000. While this copy is known to have cost Mr. Newton in the neighbourhood of $60,000 some 15 years before, one of the executors of the estate pointed out that the securities represented in the purchase had originally cost Mr. Newton less than the auction figure, and that the same securities were once more worth rather less than the auction figure.

There was considerable sentimental buying at the Newton sale, and many books went for several times their shelf value solely because they had once been units in the library of the best-known and most widely read collector of his day.

Under the competent editorship of Edward Lazare, *American Book Prices Current Index, 1933–1940* appeared at the close of 1941, recording the fluctuations of the book market during the Roosevelt era. It was a noteworthy coincidence that the last important book auction of 1941 was the dispersal of the library of William H. Woodin, President Roosevelt's first secretary of the treasury.

Prices in general reflected the instability and uncertainty of the time. The auction trend was distinctly higher, particularly in the under-$1,000 group. The bargains were principally in the

higher brackets. On the other hand, many modern books brought prices that appear excessive when set alongside the figures at which many standard and time-tested lots changed hands.

A list of books, roughly 100, that brought $1,000 or more during the 1940–41 auction season, as compiled by the *American Bookfinder,* depicted graphically the resurgence of interest in the work of William Blake during the past quarter century. The Blakes were the bright particular stars of the Newton sale, as these statistics prove: *America, a Prophecy* (1793), $5,500; *Europe, a Prophecy* (1794), $8,000; *The First Book of Urizen* (1794), $8,250; *The Marriage of Heaven and Hell* (*c.* 1794), $6,300; *Songs of Innocence and Experience* (1794–95), $6,100. This census does not take into account the Blake water colours, which are outside the province of this comment, but which sold for comparable or better prices.

Other high prices brought during the 1941 season included: Gutenberg *Bible,* the *Apocalypse of St. John the Apostle,* complete, 16 leaves (*c.* 1455), $6,000; Boswell's *Johnson* (1791), one of two known copies with the uncancelled leaf citing Johnson's views on marital fidelity, $2,500; *The Scots Musical Museum* (1790–92), Robert Burns's copy, with about 3,000 words of interleaved autograph material, including several songs, $15,500; *Alice's Adventures in Wonderland* (1865), presentation copy of the subsequently suppressed first edition, $15,300; *The Game and Playe of Chesse* (*c.* 1483), written and printed by William Caxton, $6,800; Dickens's *Pickwick Papers* (1836–37), original parts, some defects, $3,500; Dante's *Divine Comedy* (1814), John Keats's copy, with autograph material in his hand and in that of Fanny Brawne, $7,000; Milton's *Comus* (1637), $7,900.

Borates. The production of crude borates in the United States in 1940 declined about 1%, to 243,355 short tons, while exports of borax dropped about 30%, to 64,313 tons. Argentina was the next largest producer, followed by Italy and Turkey, but all three account for not more than 10–15% of the total. (G. A. Ro.)

Borglum, (John) Gutzon (De La Mothe)

(1871–1941), U.S. sculptor, was born March 25 in Idaho. Borglum once estimated that his gigantic sculpture of the faces of Washington, Jefferson, Lincoln and Theodore Roosevelt, carved in the granite cliffs of Mt. Rushmore, Black Hills of South Dakota, would last for several million years. The cost of this project, begun in 1927, was estimated at $1,520,000. Before his death Borglum finished the work on the heads, though the final touches remained to be completed from his drawings and models. The faces measure 60 ft. from chin to crown and are carved to the scale of men 465 ft. tall. Among his other works are "Wars of America," Newark, N.J.; "Sheridan Equestrian," Chicago; "North Carolina memorial," battlefield of Gettysburg, Pa.; "Woodrow Wilson memorial," which was presented by Ignace Paderewski in 1931 to the city of Poznan, Poland (this sculpture was reported destroyed by German armies in World War II); "Trail Drivers' memorial," San Antonio, Tex.; and the statue of Thomas Paine, Paris, France. During World War I, Borglum, who was also an expert aerodynamic engineer, was appointed by President Wilson to investigate inefficiency in aeroplane manufacture. He died in Chicago, March 6. (For further biographical information see *Encyclopædia Britannica.*)

Borneo. An island in the East Indies, divided politically into the British protectorate of Brunei; the independent states of North Borneo and Sarawak, both under British protection; and Dutch Borneo.

British Borneo.—Area, total *c.* 82,000 sq.mi.; pop. (est. Dec. 31, 1938) *c.* 790,000. Petroleum and natural gas are produced in considerable quantities, the total production of crude petroleum in 1939 being 939,000 metric tons. Large areas have been taken for the cultivation of Manila hemp.

Brunei: 2,226 sq.mi.: pop. (est. 1938) 38,000 (Malays 30,433); capital, Brunei Town; British resident, J. G. Black; ruler, Sultan Ahmed Tajudin.

North Borneo: c. 29,500 sq.mi.; pop. 302,174 (Chinese 53,000); capital, Sandakan; governor and commander-in-chief, C. R. Smith. Following the extension of war to the Pacific, a Dutch naval force landed in British North Borneo on Dec. 13 at British request and annihilated a Japanese settlement on the east coast. The Japanese made further landings, however.

Sarawak: c. 50,000 sq.mi.; pop. *c.* 450,000 (Malays, Dyaks, etc., *c.* 350,000; Chinese *c.* 100,000); capital, Kuching; ruler, Sir Charles Vyner Brooke (Rajah); language (official), English; religions, Mohammedan, Buddhist.

Japanese landings were made in mid-Dec. 1941, at Miri and Lubong. After destroying the oil refinery and installations in the Miri and Seria oilfields, British detachments in these areas were withdrawn.

Production.—*Brunei,* 1939 (exports): petroleum 776,027 tons; natural gas 1,181,891,000 cu.ft.; cutch 700 tons; rubber 1,285 tons. *North Borneo,* 1939 (exports): rubber 23,900 metric tons; copra 13,050 metric tons; sago flour 2,705 metric tons. *Sarawak,* 1940 (exports): benzene, kerosene oil and liquid fuel $11,036,330; rubber $26,167,140; gold $875,680; sago flour $2,184,997.

Overseas Trade.—*Brunei,* 1939: imports £379,373; exports £916,869. *North Borneo,* 1940: imports $9,978,419; exports $20,270,502. *Sarawak,* 1940: imports $32,645,192; exports $45,770,407.

Communication.—1938: roads, suitable for motor traffic: *Brunei* 102 mi.; *North Borneo* 236 mi.; *Sarawak* 101 miles. Railways open to traffic, *North Borneo* 125 miles.

Finance.—1940: Currency: Straits dollar ($1 = 2*s.*4*d.* = 47c U.S.).

	Brunei $	*North Borneo* $ (1939)	*Sarawak* $
Revenue	1,483,640	3,527,522	7,463,315
Expenditure	1,367,193	1,942,848	5,018,007

Dutch Borneo.—Area: western district, 56,664 sq.mi.; southern and eastern district, 151,621 sq.mi.; pop. total (census 1930) 2,194,533. Government: under the governor-general of the Netherlands Indies. A heavy Japanese raid on Pontianak on Dec. 19 resulted in considerable casualties and damage.

Boston. Ninth largest city of the United States, with a population of 770,816 by the federal census of 1940. Boston is a seaport at the head of Massachusetts bay and the capital of the state of Massachusetts. Area, 43·9 sq. mi., comprising most of Suffolk county. Mayor (Jan. 1, 1942): Maurice J. Tobin.

At the non-partisan elections held in Nov. 1941, Mayor Tobin (Dem.) defeated ex-governor James M. Curley (Dem.) in a strongly contested election by 125,318 to 116,430 in a total vote of 267,252. The tax rate in 1941 was $39.60 on an assessed valuation of $1,460,782,900, and the net bonded debt was $150,749,000. City employees numbered 18,540; the total departmental expenditures were $38,807,534.23. The overseers of the public welfare

expended $14,053,165. Relief and WPA employment declined markedly. The 1941 Community fund raised by 200 institutions in the metropolitan area amounted to $4,800,000.

Traffic difficulties were somewhat relieved by the Huntington ave. subway extension and the underpass at Massachusetts ave. Two miles of elevated railway on Atlantic ave. were condemned. The state bought the Boston airport to develop it further. Federal funds ($1,500,000) were secured for dredging a seaplane channel.

The *Boston Transcript*, a famous evening newspaper, discontinued publication. The noncommercial short-wave radio station, WRUL (Boston radio), broadcast propaganda to Europe and South America.

Boston was a leader among U.S. cities in civilian defense during the year. Mayor Tobin appointed a committee of public safety in June. Of the 23,000 volunteers engaged in civilian defense on Dec. 7, more than 5,000 had been trained as air-raid wardens and 2,000 as auxiliary firemen. The organization received its first trial in the false alarm of Dec. 9. The city was spending $150,000 on civilian defense at the end of the year.

Boston harbour was improved by the dredging of ship canals, and two piers were taken over by the army. The state appropriated $4,700,000 for the purchase and improvement of five Mystic river piers. A number of British warships visited the harbour for repairs in 1941, and warships and merchant ships were launched in steadily increasing numbers.

Of the total commerce of the port of Boston, imports accounted for $182,308,561 in the first eight months of 1941, a gain of 77·1% over the same period in 1940; exports were $15,925,548, a loss of 21·1%. War demands greatly reduced the number of ships calling at the port until Boston became an export centre for lend-lease goods in October.

Indices for Jan.–Nov. 1941 (average 1925–27 = 100) were as follows: manufacturing employment 96·1, a gain of 29·8%; manufacturers' payrolls 104·3, a gain of 47·9%; department store sales 73·7, a gain of 11·8%; total wages paid 93·5. Building permits in 1941 increased 42%. (S. J. McK.)

Botana, Natalio (1888–1941), Argentinian publisher, was born on a ranch near Sarranda Del Yi, Uruguay. A turbulent champion of the underprivileged, Botana fled Uruguay in 1913 after an abortive revolution and started a newspaper, *La Critica*, in Buenos Aires the same year. He revolutionized the treatment of news in Latin American journals, abandoning flowery literary style for direct writing; the circulation of the paper soared to 300,000.

After the overthrow of President Hipólito Irigoyen in 1931, General Uriburu suppressed *La Critica*, threw Botana into prison and later forced him into exile. In 1936 the Buenos Aires federal court acquitted Botana of charges filed by the German government that *La Critica* had libelled Adolf Hitler. Botana died in Jujuy, Argentina, Aug. 7, of injuries received in a motor car crash.

Botanical Gardens: *see* BOTANY.

Botany. By treating branches of a petunia plant with colchicine, A. B. Stout and Clyde Chandler (New York Bot. Garden) obtained tetraploid ($4n = 28$ chromosomes) branches while the other branches were in the usual haploid condition ($2n = 14$ chromosomes). The normal or diploid branches are self-incompatible (do not form seed when the pistil is pollinated with pollen from the same flower), but "self-pollinated flowers on the tetraploid branches on the same plants produced extra large capsules that were well filled with seeds." The change from self-incompatibility to self-compatibility resulted from the change from diploidy to tetraploidy.

From taxonomic, genetical and cytological evidence it had previously been suggested that common wheat, *Triticum vulgare*, originated from a natural cross between a wheat of the emmer type and a species of the related genus *Aegilops*. E. J. Britten and W. P. Thompson (Univ. of Saskatchewan, Saskatoon, Canada) made an artificial synthesis of a wheat with characters similar to that of common wheat, by crossing *T. turgidum* (with 14 chromosomes) with *A. speltoides* (with 7 chromosomes). This hybrid (with 21 chromosomes) was sterile but by treatment of the seedlings with colchicine the chromosome number was increased to 42 (which is that of common wheat) and the plants resulting were fully fertile, and had leaf, glume, keel and head characters similar to those of wheat.

Isolated *Datura stramonium* embryos, as small as 0·14 mm. in diameter and removed as early as 10 days after pollination, were grown successfully by J. van Overbeek, M. E. Conklin and A. F. Blakeslee (Calif. Inst. Tech., Pasadena, Calif.) provided a small amount of non-autoclaved coco-nut milk was added to the culture medium. At least three growth factors in coco-nut milk were recognized.

A species of the fungal genus *Neurospora* is able to synthesize its own requirements for *p*-aminobenzoic acid (one of the factors in the vitamin B complex) but when E. L. Tatum and G. W. Beadle (Stanford university, Calif.) exposed the fungus to X-radiation, a mutant was obtained which had lost the power to form *p*-aminobenzoic acid.

When adequate amounts of this substance were added the growth of the mutant was indistinguishable from that of the parent form. Certain chemicals could substitute partially for *p*-aminobenzoic acid, but not *o*- and *m*-aminobenzoic acids.

Previously it had been assumed that crown gall tumours were formed only by a direct stimulation by the causal organism (*Phytomonas tumefaciens*).

P. R. White and A. C. Braun (Rockefeller inst., Princeton, N.J.) found that the secondary tumours which developed in sunflower plants at some distance from the site of the primary tumour were bacteria-free. Tissue fragments were removed aseptically from the interior of such tumours and the bits of tumour tissue which were bacteria-free were grown by tissue culture methods.

One of these isolations went "through 13 successive passages, has been divided into 482 pieces, each several times as large as the original and has undergone a theoretical increase in volume of approximately 450,000 times." Some stimulus from the bacterium was essential for the induction in the host cells of the capacity to form galls but the maintenance of this capacity "is not dependent on the continued presence of the bacteria."

The "green snow" of Yellowstone National park was examined by Erzsébet Kol (Franz Joseph univ., Szeged, Hungary). The coloration is caused by the presence of immense quantities of algae (especially *Chlamydomonas yellowstonensis*), and a fewer number of certain other organisms.

The stems of a number of species normally growing in a prostrate position were induced by D. G. Langham (Inst. Exp. Agr., Caracas, Venezuela) to become erect by shading the stems. Growth habit was changed at will by changing the intensity of light.

C. E. Yarwood (Univ. of Calif., Berkeley, Calif.) found a diurnal cycle in the development of the asci of the peach leaf curl fungus (*Taphrina deformans*). "Asci start growth from ascogenous cells in the evening, nuclear divisions occur at night, and spores mature the following day. Ascospores are naturally discharged in greatest numbers in the evening with the maximum at about 8 P.M. . . ."

G. E. P. Smith (Univ. of Arizona, Tucson, Ariz.) found that

tamarisk (*Tamarix aphylla*), a rapidly growing tree, is alkali resistant, furnishes trunks which make good fence posts easily impregnated with creosote without the application of heat, and the wood proves to be of good cabinet quality with a handsome grain, suitable for desks, showcases, lamps, bowls, etc.

In 1879, Dr. W. J. Beal at Mich. Agr. Coll. started a test of the longevity of seeds of various species (20 or 21) of plants growing in the vicinity. The seeds were mixed with sand, placed in glass bottles, and buried approximately 18 inches below the ground surface. At intervals of five years up to 1920, and since then at intervals of ten years, a sample bottle has been removed and the number of seedlings produced by the various species has been recorded.

The tenth sample was removed and tested in 1940 by H. T. Darlington (Mich. State Coll., East Lansing, Mich.). Only four species produced seedlings in the 1940 test: *Oenothera biennis*, *Rumex crispus*, *Verbascum Blattaria* and *Silene noctiflora* (this last-named species not being listed as having been included originally and not presenting an appearance in any previous test). "Thus, only four species came through for the sixty-year trial as compared with five species for 1930 and eight for 1920." The marked drop in the germinations for the 1940 test may be related to the chipping out of a piece of glass from this bottle. (*See* also HORTICULTURE.)

Botanical Gardens.—Cornell university published in 1941 a bulletin entitled *The Cornell Arboretum*. This speaks of adding 396 ac. to the arboretum, with other acquisitions along Fall and Cascadella creeks to follow.

The arboretum will ultimately become an extensive tract running north and south of the university with a large loop to the east. The work will be tied in with many phases of plant science in the university.

New York Botanical garden was fenced, thus eliminating through traffic and giving the garden for the first time defined limits. Educational facilities were extended especially for training in gardening.

Director Gager of Brooklyn Botanic garden received the Arthur Hoyt Scott gold medal and a cash award of $1,000 for his work in developing the garden as a scientific and educational institution during the 30 years of his directorship. The garden has added an ivy garden, 60 hardy species and varieties, to the 20 or more "gardens within a garden." Dr. Svenson has made a study of the littoral flora of Ecuador to compare with his former studies of the Galapagos flora and with Darwin's findings on geographic distribution of plants. Additions were made to the flowering cherry collection.

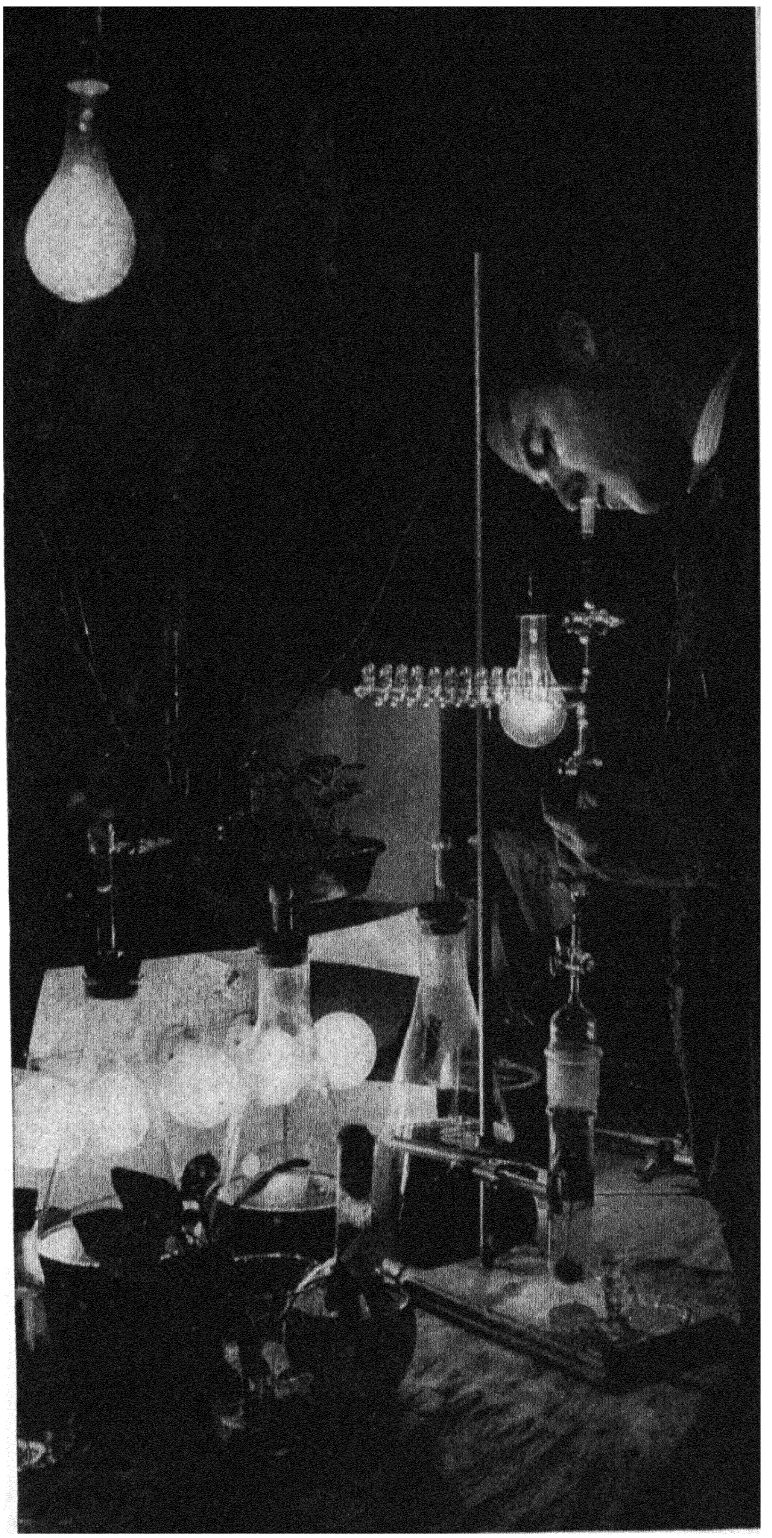
Missouri Botanical garden made great progress in construction of its new arboretum 35 mi. southwest of the city. The authorities also carried out various planting plans. At the city garden they had an exhibit of 15 new hybrid water lilies that they developed during 15 years of breeding. These were illustrated in colour in the March *Bulletin*.

Arnold arboretum published the second edition of *Rehder's Manual of Cultivated Trees and Shrubs*, also the *Merrill-Walker Bibliography of Eastern Asiatic Botany*. Both are monumental in the fields covered.

University of Wisconsin arboretum established a prairie nature trail on a 100-ac. plat. They were in 1941 also studying propagation and management of wild flowers to help eliminate the promiscuous gathering of these in the wild. University of Washington studied the propagation of *Calluna* and *Erica* and have a large collection of heathers. The Holden arboretum, Cleveland, Ohio, tested several species of rhododendron for hardiness in that region. Montreal Botanical garden emphasized the growing of model home vegetable gardens of city lot size (25x100 ft.) and of school gardens. Morton arboretum, Lisle, Ill., added to its hard road until it had 13 mi. within the arboretum.

No *Bulletins of Miscellaneous Information* were received from Royal Botanic gardens, Kew, after July 1940. The garden suffered material damage from bombs. (*See* also HORTICULTURE.)

(W. C.)



ARTIFICIAL PHOTOSYNTHESIS demonstrated in 1941 in the laboratories of the Carnegie institution at Stanford university, California. A small sunflower plant in the sealed glass tube at the right feeds on radioactive carbon dioxide introduced by a spiral tube. Electric bulbs take the place of sunlight in completing the process of photosynthesis

Bowling. This was in 1941 the leading competitive indoor sport in the U.S., played by about 12,000,000 persons on about 180,000 alleys in recreation centres, clubs, schools, etc. It was estimated that bowling represented an annual monetary turnover of some $350,000,000 for fees, dues, equipment, apparel, refreshments, etc.

Three all-time records were marked up during the 41st annual American Bowling congress tournament in St. Paul, Minn., from March 13 to May 6, 1941. The attendance of 150,000 was a new high. Twenty-five singles recorded totals of 700 or better. Two outstanding individual achievements were: the perfect 300 game rolled by William Haar, of Chicago, Ill., in the doubles, and a 299 game, by William Caskey, of Canton, O.

Ray Farness, of Madison, Wis., emerged as individual star, scoring 767, the highest score of the 1941 classic and the fifth highest in A.B.C. history, when he and William Lee took the doubles title with 1,346. Fred Ruff, of Belleville, Ill., won the singles title with 745. Top honours in the two-man event went to Bill Lee and Ray Farness; the five-man crown was won by the Vogel brothers combination from Forest Park, Ill. Harry Kelly, of South Bend, Ind., won the all-events title with 2,013. Mrs. Nancy Huff of Los Angeles, Calif., won the singles with 662.

(J. B. P.)

Boxing. As he did in 1937, 1938, 1939 and 1940, Joseph Louis Barrow, known to countless sport followers as Joe Louis, the "Brown Bomber," reigned supreme in boxing in 1941.

Other divisions of boxing were clouded in confusion and Louis's activities made the heavyweight ranks the most active in the sport. He defended his title seven times, knocking out all opponents who faced him, and bringing to 19 the number of times he risked his crown since the night in 1937 when he knocked out James J. Braddock in eight rounds of a bout held in Chicago, Ill.

Louis realized $347,678 in the aggregate from his two most important battles of the year, the first against Billy Conn, Pittsburgh boxer who voluntarily surrendered the world light-heavyweight championship for the chance to fight for the heavier and richer crown, and the second against Lou Nova, California challenger. Smaller purses realized from his five other championship battles, added to this sum, raised Louis's ring earnings from the start of his boxing career back in 1934 to slightly more than $2,180,000. By the close of 1941, only Jack Dempsey and Gene Tunney topped Louis as a "money-making champion." No titleholder, however, going back to the days of the great John L. Sullivan, ever defended his title as many times as Louis.

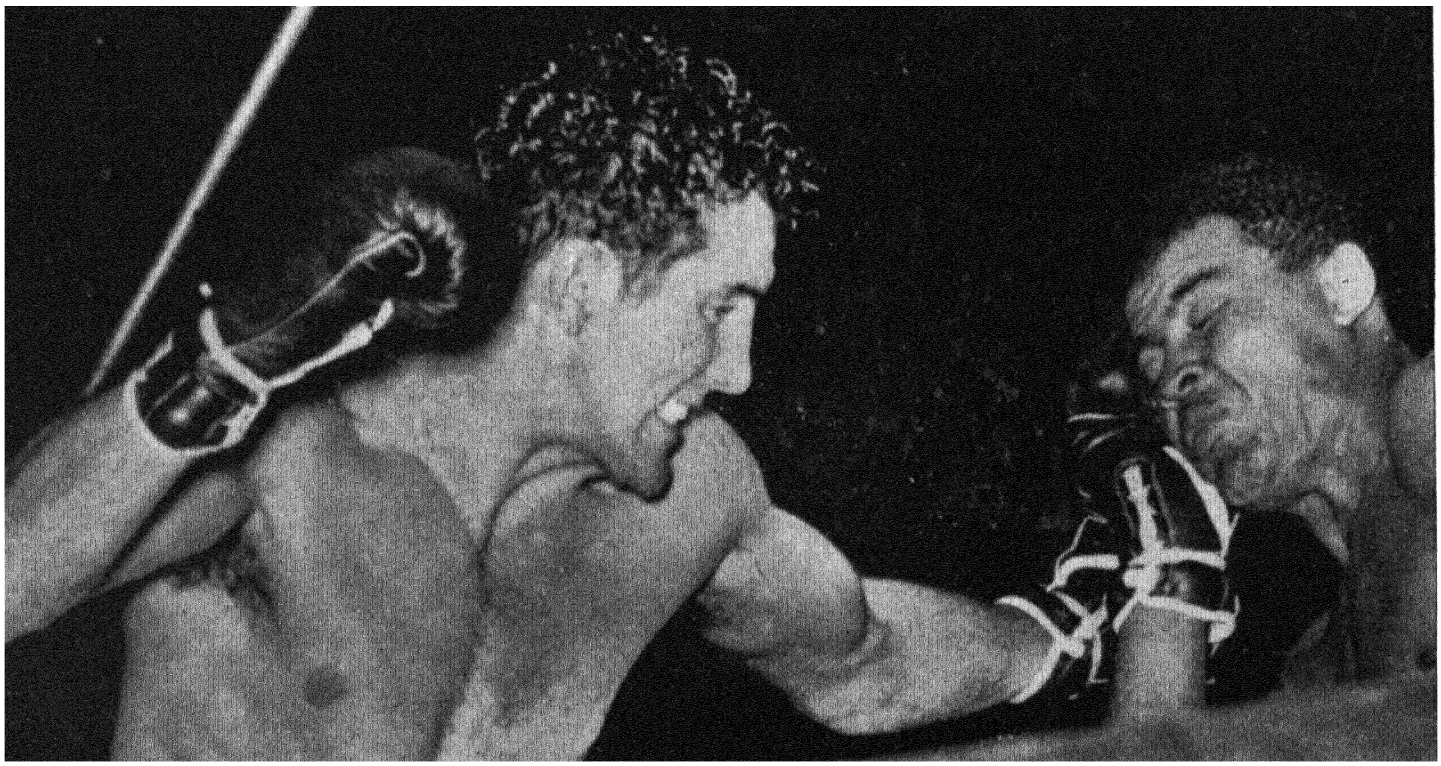
Strangely, the greatest danger came to Louis from two opponents who were appraised as among his least dangerous rivals. Jacob Baer, Jr., known as Buddy Baer in boxing, a California 250-pounder, bowled Louis out of the ring in the first round of their battle in Washington, D.C., May 23, with a ponderous right-hand punch. Louis clambered back into the ring to save his title, and proceeded to subject Baer to such a terrific beating the Californian did not respond to the bell for the seventh round. The result went as a seven-round knockout, since the sixth round had been completed.

On June 18 Louis again faced eclipse when for 12 rounds of a scheduled 15-round bout at the Polo Grounds, New York city, Conn outboxed the champion and closed the 12th round by flooring Louis with a left hook to the jaw. But the experience only maddened Louis, who threw all his fury into a 13th round in which he knocked out Conn.

At the Polo Grounds, too, on Sept. 29, Louis knocked out Nova in six dull rounds before the largest crowd of the season. There were 56,549 persons who saw the contest, paying the year's largest receipts, $583,821. A crowd of 54,484 persons saw the Conn bout in June, paying receipts of $451,743.

Louis knocked out Clarence (Red) Burman in five rounds, Jan. 31, 1941, in his first bout of the year. He followed this with a two-round knockout of Gus Dorazio in Philadelphia, Pa., Feb. 17. On March 21 he knocked out Abe Simon in 13 rounds at Detroit, Mich., and on April 8 Louis knocked out Tony Musto in nine rounds in St. Louis, Mo. The Baer bout followed this one, and was followed by the contests against Conn and Nova.

Rival claims to the light-heavyweight title were set up when Conn voluntarily surrendered the crown in order to get the Louis bout. The dispute was settled Aug. 26 when Gus Lesnevich, Cliffside Park, N.J., defeated Tami Mauriello, of New York city, in a 15-round bout. Mauriello, who had disputed Lesnevich's title claim, suffered a duplicate beating on Nov. 14 in a return bout. In the middleweight class the abdication of Billy Soose, of Farrell, Pa., engendered confusing title claims which were settled only when Tony Zale, Gary, Ind., who had recognition as National Boxing association champion, conquered Georgie Abrams, of the U.S. navy, on Nov. 28. On July 29 Freddie (Red) Cochrane, of Newark, N.J., defeated Fritzie Zivic, Pittsburgh, Pa., to win the world welterweight championship in the biggest boxing upset of the year. Shortly after the bout Cochrane



JOE LOUIS was near defeat in his fight with Billy Conn June 18, 1941 at New York city, but the champion rallied to knock out the challenger in the 13th round

enlisted in the navy. Lew Jenkins, Sweetwater, Tex., lost his lightweight championship claims, which had been recognized in New York, when Sammy Angott of Washington, Pa., defeated him Dec. 19 in a 15-round bout held in Madison Square Garden, New York city. Angott, who had been recognized as National Boxing association champion, thereby gained undisputed right to the title. Chalky Wright, Los Angeles, Calif., and Jackie Wilson of Pittsburgh, Pa., disputed the world featherweight championship as the year ended, Wright being recognized by the New York State Athletic commission, while the National Boxing association recognized Wilson. Lou Salica of New York city three times defended his world bantamweight title, his victims being Tommy Forte, Philadelphia, Pa. (twice), and Lou Transparenti, Baltimore, Md.

Amateur Boxing.—Boxing under the auspices of the Amateur Athletic union and among college teams attracted wide popularity, although competition was on a modified scale in college circles. Cornell dropped boxing as an intercollegiate sport, although favouring expansion on an intramural basis, and Annapolis considered dropping the intercollegiate scale, too. Syracuse university won the Eastern Intercollegiate association championships. The Eastern Intercollegiate conference championships were cancelled. The University of Idaho captured the National Collegiate Athletic association championships and produced three individual champions.

(J. P. D.)

Boys' Clubs of America, Inc.

Boys' Clubs of America, Inc., is a federation of 352 organizations functioning in 197 cities, which provide leisure-time activities under trained leadership for nearly 300,000 boys between the ages of 7 and 18. They are found chiefly in the congested high-delinquency districts of urban communities. Boys' clubs are non-sectarian organizations and welcome boys of all classes and creeds. Each organization within the membership of the Boys' Clubs of America is completely autonomous, but looks to the national organization for the stimulation and promotion of the Boys' Club movement, and program, personnel and finance services which would be difficult, if not impossible, to secure if left to the individual units.

Boys' Clubs of America, Inc., was organized in Boston, Mass., on May 19, 1906. Its control is vested in a board of directors who are elected by vote of the representatives of the member organizations. Specific responsibilities are delegated to a professional staff and to an executive committee. The officers are Herbert Hoover, chairman of the board; William Edwin Hall, president; Albert H. Wiggin, treasurer; William Ziegler, Jr., secretary. The headquarters are at 381 Fourth avenue, New York city. The budget for the year 1940 was approximately $170,000.

Boy Scouts.

On Feb. 8, 1941, the Boy Scouts of America celebrated its 31st anniversary, on which date Franklin D. Roosevelt, president of the United States and honorary president of the Boy Scouts of America, delivered a challenging message to the nation over a nation-wide broadcast.

The theme of the 31st national council meeting, held at the Willard hotel, Washington, D.C., from May 16 to 17, was "Physically Strong, Mentally Awake and Morally Straight." Members attended from all parts of the U.S.

The program for strengthening and invigorating democracy, organized and launched in 1940, was further emphasized during 1941 and Scouts took active part in the defense program of the U.S. government. Troops took inventory of membership, equipment and training on a nation-wide scale in order to be in a position to measure their readiness to serve the government.

The first call for Scout service was received from the president of the United States on April 26, 1941, requesting that Boy Scouts lend their aid to the secretary of the treasury as special messengers in the distribution of the official government posters. Scouts all over the country responded enthusiastically to this emergency call and a total of 1,607,500 posters were distributed.

On July 24 a second nation-wide service project was performed by the Boy Scouts of America, in co-operation with federal, state and local officials and other volunteer agencies. This project was the collection of aluminum. Again Scouts rallied to an emergency call and more than 10,000,000 lb. of aluminum were collected.

Other activities in relation to the unlimited emergency in the national defense program in which Scouts took part were: Organization of emergency service corps, patriotic mobilization as a demonstration of national unity, blackout demonstrations and manoeuvre participation, defense housing survey, United Service Organizations campaign participation, baseball defense bond day, civilian defense volunteer offices, inter-American good-will participation, national book campaign, consumers' pledge distribution, participation in civilian defense week, national salvage campaign. During 1941 there was an increase in membership of 5.7%. There were 2,162,570 persons on the rolls of the Boy Scouts of America during 1941. There was a total of 50,739 troops and packs. Since 1910, 10,183,743 persons have been members of the organization (Dec. 31, 1941).

BOY SCOUTS of Madison, Wis. and of many other U.S. cities made house to-house canvasses for used aluminum in the summer of 1941 to bolster the nation's supply of this strategic metal

Great Britain.—After the death of Lord Baden-Powell (*q.v.*) on Jan. 8, 1941, in Kenya, British East Africa, Lord Hampton became Chief Scout of the British Boy Scouts association.

Scouts performed more than 180 different kinds of service jobs. More than 60,000 boys have been awarded the National Service badge for sustained work as A.R.P. messengers, first-aid orderlies, telephonists, signallers, stretcher bearers, instructors to the home guard, assistants in rest centres. Many of these service jobs were dull, routine tasks, others meant long periods on duty waiting for the emergency and being prepared to meet it when it came. The Scout fitted himself for these emergencies by training. He learned how to fight fire, how to act if an attack is made with poison gas, how to deal with panic. He attained skill in first aid, in relaying verbal messages, in signalling and in a thorough knowledge of his own district. Many lives were saved by Scouts during air raids. (J. E. W.)

Brandeis, Louis Dembitz

(1856–1941), U.S. jurist, was born in Louisville, Ky., Nov. 13. Educated in elementary schools in Germany and the United States, he was graduated from Harvard law school in 1877 and practised in Boston from 1879 to 1916. Young Brandeis started as a corporation lawyer, but swung toward economic liberalism and won a reputation in the years between 1907 and 1916 as a crusader "for the people" and as an active foe of big business monopoly. In Jan. 1916, he was appointed by President Wilson as associate justice of the supreme court, being the first Jew to attain this position. Justice Brandeis established a record as a militant liberal in the high court, and his name was frequently linked with that of Oliver Wendell Holmes in dissenting opinions. He upheld the minimum wage law for women and was the author of a frequently cited majority opinion in which he defended labour's right to picket but not to intimidate.

Of 16 major New Deal laws which were brought before the supreme court, Justice Brandeis sided with the administration in 10 instances, but in 1935 he voted against the National Recovery act, which aroused his dislike for "bigness." He resigned from the

court in Feb. 1939 because of age and failing health and resumed an active role in the Zionist movement in an effort to relieve the plight of Jewish refugees from Germany. He died in Washington, D.C., Oct. 5. (See *Encyclopædia Britannica.*)

Brauchitsch, Walther von (1881–), German general, was born in Berlin on Oct. 4, the son of a general of cavalry, and was educated in the German capital. He entered a military academy and became a lieutenant in 1900. In 1912 he became an officer of the German general staff and he served in this position during World War I. He was appointed inspector of artillery in 1932, and the following year he succeeded Marshal von Blomberg as commander of the East Prussian army district, which in 1935 was transformed into the 1st army corps. In 1937 he became commander of the 4th army group, and in Feb. 1938, after the "army purge," he succeeded Gen. von Fritsch as commander in chief of the German army. He personally directed the campaigns in Poland, the Netherlands, Belgium and France. For his military services to the reich he was singled out for mention by Adolf Hitler on July 19, 1940, and, with 11 other generals, was raised to the rank of field marshal.

In 1941 Brauchitsch supervised German operations in the Balkans and Crete, in northern Africa and in the U.S.S.R. When his armies in the east slowed down, wavered and finally turned backward, Hitler announced on Dec. 21, 1941, that he had removed Brauchitsch as commander in chief as of Dec. 19 and, answering an "inner call," had taken over that position himself.

Brazil. A republic in eastern South America and largest independent country in the western hemisphere; language: Portuguese; religion: overwhelmingly Roman Catholic; capital: Rio de Janeiro (pop. 1,781,567); president in 1941: Dr. Getúlio Vargas.

Area and Population.—The area is 3,291,416 sq.mi., 7·5% more than that of continental United States. The boundary approximates 23,648 km. in length and touches every South American country except Chile. The population was officially estimated at 45,002,176 on Dec. 31, 1939. Preliminary reports on the comprehensive census taken Sept. 11, 1940 (published late in 1941), however, showed a total population of only 41,356,605, distributed by states as follows: Alagoas, 957,621; Amazonas, 449,077; Bahia, 3,907,086; Ceará, 1,994,000; Espirito Santo, 758,425; Goyaz, 882,865; Maranhão, 1,246,813; Matto Grosso, 427,629; Minas Geraes, 6,797,219; Pará, 949,808; Parahyba, 1,424,457; Paraná, 1,243,838; Pernambuco, 2,674,683; Piauhy, 832,250; Rio de Janeiro, 1,861,727; Rio Grande do Norte, 774,503; Rio Grande do Sul, 3,336,632; Santa Catharina, 1,182,854; São Paulo, 7,230,163; Sergipe, 541,945; Acre (territory), 81,326; federal district (*i.e.*, Rio de Janeiro city), 1,781,567. No census reports on individual cities have been made; the chief cities (with 1939 official pop. est.) are: São Paulo, 1,322,643; Recife (Pernambuco), 550,389; São Salvador (Bahia), 388,183; Porto Alegre, 385,389; Belém (Pará), 318,341; Bello-Horizonte, 217,218; Santos, 203,126. In 1941 unofficial sources estimated the approximate racial distribution to be: whites, 32·7% (including 8·9% chiefly Italian and 2·6% chiefly German stock); Negroes and mulattoes, 37·2% (full-blooded Negroes 5% to 12%); Indians and mestizos (pure Indians 2·2%), 17·7%; orientals, 0·7%. The Negro and mulatto population predominates in the north; the southern states are largely white. The German elements are concentrated in the south, particularly in Santa Catharina, Paraná and Rio Grande do Sul states.

An average of about 20,000 permanent immigrants were entering the country annually until 1941 (1939, 22,668; 1940, 21,259). To check further increase in the European-born population, and especially a threatened large influx of refugees, a sweeping decree-law was issued March 19, 1941. Under it, immigration was restricted to nationals of American countries, except for agricultural workers, skilled technicians and those bringing at least 400 contos ($20,000) of capital.

History.—Brazil's history in 1941 was featured by foreign relations, with a marked trend toward increasingly close political and economic ties with the Americas. Improvement of defenses, repression of axis propaganda and other activities, reorientation of the national economy toward greater economic interdependence of the Americas and development of a more diversified production were the dominant factors.

Of particular consequence to Brazil was the continued shortage in shipping facilities. (*See* below, under *Communication.*)

Development of transportation by air was coupled closely with defense preparations. Direct communication with continental Europe ceased in December when the Italian "LATI" air service between Italy and Brazil (via Dakar), long a carrier of axis-destined mica, crystal, diamonds and other minerals of great importance for war needs, was discontinued as a result of the refusal of United States-controlled oil companies to supply fuel. Subsequently, its charter was cancelled by the Brazilian government. At the same time, the German Condor lines operating within Brazil were forced to quit. Internal and external air transportation was relieved, however, by corresponding expansion of the Panair do Brasil, a Pan American Airways subsidiary. Especially significant was the permission granted Panair to improve and construct landing fields in the strategic Natal area 1,600 mi. from axis-controlled Dakar (*q.v.*) in West Africa. In recognition of the increased importance of the Natal region, Brazil extended the service period of its military there.

Relations with the axis powers were strained on several occasions during the year. In March vigorous protest was made to Germany over the bombing of a Brazilian ship in the Mediterranean. The ever-present problem of a large, only partly assimilated German population in the south continued to hinder Brazil's nationalistic program. In October a German "sport society" in Santa Catharina was closed for giving instruction in German. In the same month a pro-nazi newspaper, although printed in Portuguese, was suppressed for slurring the Portuguese language and "preaching racism and sedition." Earlier in the year a presidential decree gave all foreign language publications six months to terminate. This order affected some 50 periodicals, including 15 German, 9 Italian, 8 Japanese, 5 English, 5 Syrian, 4 Spanish.

Fear of pro-axis revolutionary activity was heightened during the year, especially after disclosures in Argentina in September revealed the existence of a widespread revolutionary organization there with many "cells" in Brazil, which—it was charged—were planning invasion of Argentina from southern Brazil (*see* also ARGENTINA).

Pres. Vargas and other high officials frequently emphasized Brazil's co-operation in furtherance of American solidarity. The Havana conference pacts of July 1940 were formally ratified in March, and relations with the United States were especially close. A number of Brazilian army officers were sent to the United States for special training, and United States aid in military supplies and installations was accorded by a "lend-lease" agreement of Oct. 1. Under it, in return for credits estimated at between $90,000,000 and $110,000,000, Brazil, on its part, undertook to guarantee to supply the United States with certain strategic materials, notably minerals.

Co-operating with the United States in hemisphere defense, in June Brazil backed a United States declaration to Portugal that the Azores and other Portuguese Atlantic islands must remain in

friendly hands. Formal and active support was given in November to United States defense measures in Surinam (*q.v.*). Garrisons on the Surinam border were strengthened, and a military mission was sent to Paramaribo to co-operate with the Netherlands and the United States in the defense of the colony.

The only irritant of consequence to friendly U.S.-Brazilian relations arose from the publication in July of a United States blacklist of axis-controlled firms in Latin America. Designed to throttle pro-axis economic activities in Hispanic America, the hastily drawn initial list included the names of several influential Brazilians. Enforcement was complicated, furthermore, by Brazilian laws penalizing refusal to sell goods. Subsequent modification of the blacklists alleviated the friction.

Upon the entry of the United States into active war in December, Brazil moved closely with the United States. The press indignantly condemned Japanese methods at Pearl Harbor. The government officially reiterated its support of continental solidarity. Official support was given also to the policy initiated by Uruguay, under which the United States and other American nations at war were regarded as nonbelligerents and therefore entitled to full access to Brazilian ports and airfields. More than $100,000,000 of non-American bank deposits were frozen by executive decree. In addition, registration was denied the German D.N.B., and the nazi Transoceanic and Italian Stefani news agencies were placed under special censorship. The National Press council forbad criticism of the policies of any American nation. At the same time, extra police precautions against disorders were taken to avoid violence in many areas, especially São Paulo, centre of a large Japanese population.

As the year closed, Brazil prepared to play host to a meeting of American foreign ministers scheduled for Jan. 15, 1942, in Rio de Janeiro to consider the practical application of the Havana pacts under the new war conditions.

Under war conditions, Brazil, in 1941, further stressed its long-established policy of cultivating close economic, political and cultural relations with its more immediate neighbours. Several commercial and cultural conventions were signed with Paraguay in June. Among the more important provisions were those making Santos a free port and providing for improved communications between that city and Concepción, Paraguay. A treaty signed with Chile in November marked another step toward greater economic interdependence. Political and economic relations with Canada were strengthened with the exchange of diplomatic representatives and, following the visit in October of a Canadian economic commission, an exploratory trade agreement was signed. In the same month, Brazil and Colombia signed a cultural accord facilitating student exchange.

Of tragic consequence in 1941 were severe floods in the southern state of Rio Grande do Sul—the worst since 1876. Porto Alegre suffered especially, where public utilities were entirely wiped out. Some 60,000 were left homeless within the state, and the large rice crop was all but destroyed. The total property loss was estimated at $5,000,000.

More cheerful was the continued social advance in 1941. On May 1, Pres. Vargas formally inaugurated the labour courts provided for by the constitution of 1937. A decree in September forbad labour of children under 14 and restricted labour between 14 and 18 according to family need.

Education.—In 1937, there were 2,662,243 in primary schools, approximately 300,000 in secondary, normal and technical institutions and 25,441 in universities and colleges. Education accounted for 8.42% of all public expenditures in 1940.

Defense.—Brazil had a standing army of 88,548 in 1941 and a trained reserve officially estimated in excess of 250,000, a fourth of which was state militia. Military service is compulsory. The navy in 1941 had 2 old battleships, 2 cruisers, 16 destroyers and 4 submarines. Nine destroyers were building. The air force had 100 planes and 3,500 officers and men.

Finance.—The monetary unit is the milreis (value in 1941: 5 cents to 6 cents, U.S.), ordinarily expressed in contos of 1,000 milreis each. Improved finances permitted the liquidation, in 1941, of a $19,200,000 loan made in 1937. By decree of April 1941, all banks of deposit were nationalized, but in November modifications were permitted in favour of American corporations.

Foreign Trade.—In 1940, exports totalled 4,966,158 contos, a decline of 11.5% from 1939; imports were 4,964,149 contos, a decline of 0.4%. The chief exports, coffee (32.11%), cotton (16.9%), fresh and canned meats (9.3%), hides and skins (4.5%) and cacao (3.9%), except for meats, declined. Meats, carnauba wax (3.4%), castor oil (2.4%), precious stones, largely diamonds (2.0%), and vegetable oils (1.9%) registered increases. Leading imports were machinery and apparatus (15.0%), wheat (9.5%), iron and steel manufactures (8.9%), automobiles (6.3%), coal, coke, etc. (5.8%), chemicals and pharmaceuticals (5.6%).

In 1940, the United States continued to be Brazil's best customer, taking 42.3% of its exports (1939, 36.2%), followed by Great Britain 17.3% (1939, 9.6%), Argentina 7.2% (5.5%), Japan 5.7% (5.5%), China 3.1% (3.0%), Canada 2.1% (0.3%), Uruguay 1.5% (1.0%), Portugal 1.3% (0.6%), Spain 1.1% (0.3%), Chile 0.77% (0.4%). By 1940 the war had virtually eliminated Germany (1939, 12%), France (6.3%), and other continental European countries.

The United States dominated Brazil's imports in 1940, supplying 51.9% (1939, 33.6%). Argentina, with 10.8% (1939, 8.4%), rose to second place over Germany and Great Britain. Other leading suppliers were Great Britain 9.4% (9.3%), Curaçao 4.7% (3.4%), Japan 2.4% (1.5%), Canada 1.9% (1.5%), Portugal 1.6% (1.8%), British India 1.4% (1.1%). Former major exporters to Brazil who were eliminated in 1940 included Germany (1939, 19.2%), Belgium and Luxembourg (4.2%), France (2.8%), Sweden (2.3%), Italy (1.8%).

Foreign trade with other South American countries rose sharply in 1940, with exports 10.3% (1939, 7.2%), largely to Argentina (7.2%) and Uruguay (1.5%), and imports 15% (1939, 10.3%), with Argentina supplying 10.8%, Uruguay 1.2% and Peru 1.1%.

Despite further restriction of markets, curtailment of transportation facilities, and threatened, if not actual, lack of raw materials, Brazilian trade rose through the first ten months of 1941, when a favourable balance approximated $50,000,000 in contrast to a $200,000 deficit for the same period of 1940. The improvement resulted from increased prices, large shipments of cotton to Japan, China and Canada and a heavy demand for a variety of minor export commodities, including manganese, iron ore, mica, quartz crystals, carnauba wax, castor seed and industrial diamonds. In the first eight months of 1941, exports increased 41% to $223,237,000, while imports declined 6.4% to $169,161,000. The United States took 52% of the exports during this period and furnished 58% of the imports. Great Britain purchased 13.5%, but its sales were only nominal. In the first ten months of 1941, Germany and Italy, who together in 1938 had supplied 28% of Brazil's imports and taken 21% of its exports, furnished 3% of all imports and purchased 2% of all exports.

Communication.—Brazil's external communications, ordinarily good, suffered from wartime conditions in 1941. Lack of bottoms, already acute, was further threatened through the withdrawal of Japanese vessels and abandonment of the principal United States regular shipping services. The situation was improved in November, however, with the purchase of eight Italian ships (46,000 tons) tied up in Brazilian ports.

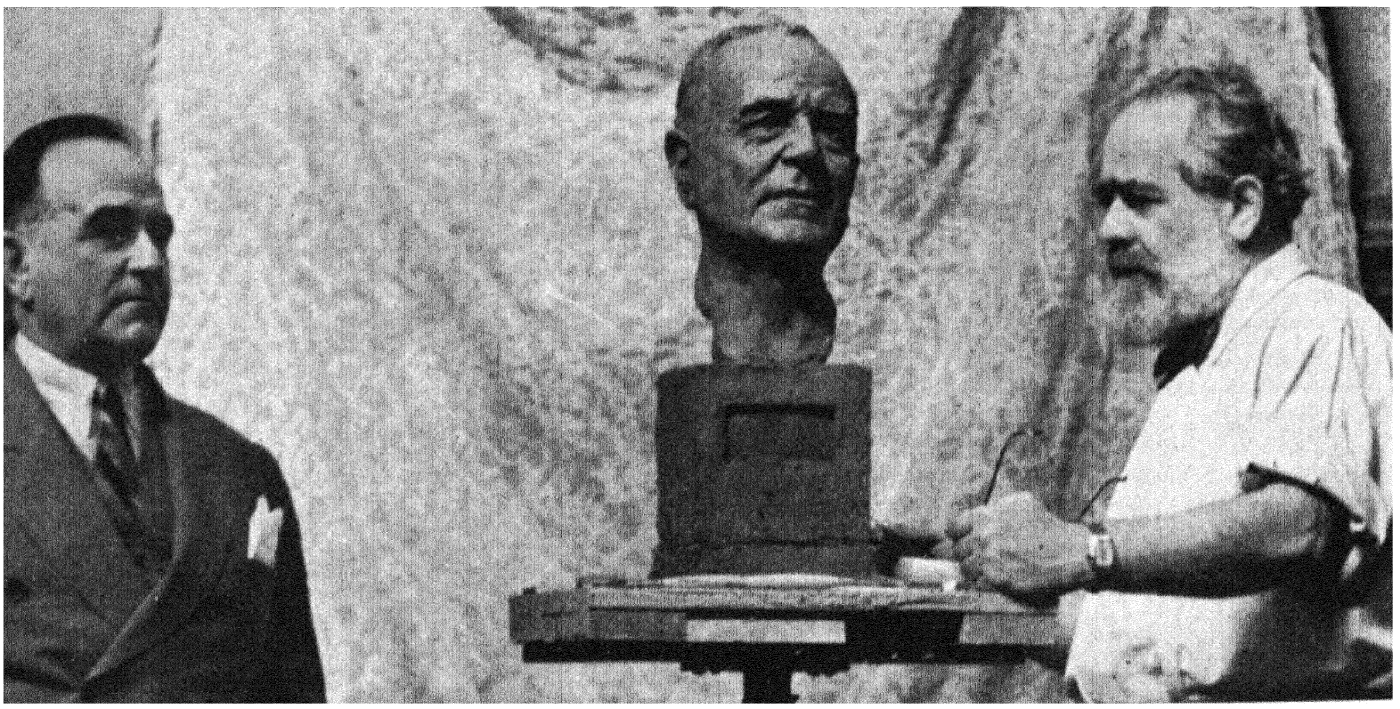
Through most of 1941, the Italian "LATI" air line maintained service from Italy, via Dakar, to Brazil and thence to Buenos Aires and Chile, but was discontinued in December (*see* above). Pan American Airways expanded its service, including that of its subsidiary, Panair do Brasil, which took over the domestic routes of the German Condor line.

Creation of an air ministry, with jurisdiction over both civil and military aviation, in Jan. 1941, marked the culmination of a decade of aviation development in Brazil. Aviation statistics as of 1940 showed 512 landing fields (1930, 31), 7,900 regular scheduled flights (1930, 1,780), 4,337,300 flown miles (1930, 673,735 mi.), 70,734 passengers carried (1930, 4,567), 999,894 kg. of express carried (1930, 23,864 kg.).

Railway and highway communications are inadequate, with the Amazon basin depending almost entirely on waterways. In 1941 Brazil had 21,750 mi. of railways in operation, and about 600 mi. under construction, including an extension of the Central railway of Brazil to tap important iron and manganese deposits, and lines to the Paraguayan and Bolivian frontiers. The last was planned as part of an eventual transcontinental railway from Santos to the Pacific at Arica, Chile.

In 1941 there were about 140,000 mi. of highway in Brazil, most of it unsurfaced.

Agriculture.—Brazil is primarily an agricultural country, with one state, São Paulo, producing 40% of the national farm wealth. Coffee, the chief export crop, ordinarily provides half of the world's production, but accounted for only 32% of 1940 exports against more than 70% in 1930. The 1941–42 crop, owing to drought conditions, was estimated to be the smallest in many years. Under government policy and control, a sacrifice quota of 35% was purchased by the government for destruction or for use in the manufacture of caffelite, a plastic, leaving available some 12,000,000 bags of the 1941–42 crop against 20,850,000 bags in 1940–41. Under the inter-American coffee quota, Brazil was originally allotted 9,715,338 bags of 132 lb. for export to the United States in the year ending Sept. 30, 1941, with an additional export allotment of 7,813,000 bags for other countries (*i.e.*, including continental Europe). The United States quota was altered several times during 1941, in order to check sharply advancing prices, and the 1941–42 quota was placed at 10,317,904 bags, a 10.945% increase. Brazil's proportion was thus approximately 57.5%. Cotton, Brazil's second crop, accounted for 16.9% of all export values in 1940. The 1940–41 northern crop was officially estimated at 146,700 metric tons, the southern crop 360,000 to 400,000 tons. About 25% is for domestic consumption. Exports for the first eight months of 1941 were 222,244 tons, valued at 758,158 contos, against 146,126 tons of 575,735 contos value in the corresponding period of 1940. Japan, Canada, United States and China were the principal purchasers. Scarcity of bottoms and the spread of World War II to the far east, however, darkened the outlook for continued improvement.



PRESIDENT GETULIO VARGAS of Brazil sitting for U.S. sculptor Jo Davidson in 1941. Davidson was also commissioned to do the heads of the other South American presidents, as part of the U.S. goodwill program

Corn is important for domestic consumption. The 1939 production was 5,405 tons. Other important agricultural products include rice, sugar, oranges, beans and manioc. Forest products, mostly semi-cultivated, include yerba maté (Paraguay tea), carnauba wax (1939 export, 8,653 tons), castor seed (1940, 117,000 tons), oiticica oil (1940, 7,235 tons), a substitute for tung oil. War demands greatly increased both the unit value and volume of Brazilian vegetable waxes and oils. The babassu palm nut, whose oil is used as a combustible, was being developed in 1941 as a gasoline substitute.

Brazil is the natural home of the rubber plant, but lost its market to the plantation rubber of the East Indies. A revival was being furthered, however, in 1941 and the United States rushed, by air, two shipments of seed for experimental purposes. Brazilian forests, it is estimated, contain 5,000,000,000,000 ft. of hardwoods.

The livestock industry provides frozen meats, hides and skins for export. In 1938 there were 41,883,374 cattle, 23,542,966 hogs, 14,167,450 sheep, 6,712,710 horses, 5,905,581 goats, 4,119,273 mules.

Manufacturing.—Brazilian manufacturing received its start in World War I, and under World War II received a further great stimulus. Total industrial production in 1940 was valued at 25,145,000 contos, an increase of 25.77% over 1938. The leading manufactures in 1940 (with percentage of increase over 1938) were: foodstuffs, 8,490,000 contos (23.3%); textiles, 5,708,000 contos (14.3%); chemicals and pharmaceuticals, 1,886,000 contos (24.1%); metal manufactures, 1,595,000 contos (38.9%); furniture and woodwork, 1,230,000 contos (37.1%); paper, 769,000 contos (48.5%). Plans for a Brazilian steel industry continued, with a large steel plant under construction.

Mineral Production.—Brazil is rich in minerals and war demands provided attractive markets, but the industry is handicapped by lack of adequate transportation facilities. There are extensive coal deposits in the southern states of Rio Grande do Sul and Santa Catharina but they are of poor quality, with 1,336,301 tons produced in 1940; by law, this coal must be consumed in mixture with imported coal. Brazil possesses about 22% of the world's iron supply; 185,548 tons of pig iron were produced in 1940. Manganese production totalled 270,000 tons in 1940.

War encouraged the exploitation of heretofore minor minerals. These and their 1940 export figures are: diamonds (254 kg.), rock crystal (1,103 tons), mica (1,117 tons). Potential petroleum deposits were under development in 1941 in northern Brazil, especially in the state of Bahia, and a railroad was being pushed west to tap Bolivian resources. In 1940 Brazil produced 697,800 tons of cement and in 1941 was virtually self-sufficient in that product.

Bread and Bakery Products.

The most important development in the U.S. and British baking industries was the production of white breads containing vitamins and minerals natural to whole wheat. In the U.S. this nutritionally improved white loaf was known legally as "enriched bread." It became generally available in May 1941, and by the end of the year comprised somewhat more than one-third of all bread produced in the U.S.A.

Enriched bread has added thiamin (vitamin B_1), the pellagra-preventive vitamin known as nicotinic acid or niamin, and iron. The amounts of these added nutrients in the U.S.A. were those recommended by the National Research council, but official federal standards for this product were to be issued early in 1942, as a result of hearings held before the Federal Food and Drug administration in Aug. 1941.

The nutritional enrichment of white bread may be accomplished in several ways. One is by the use of enriched flour, for which federal standards were promulgated in 1941, to take effect on Jan. 1, 1942. Another method is by the use of enriched yeast, and a third by the direct addition of the vitamins and iron to the dough.

Through the customary use of dry milk solids, this white bread also contains riboflavin (vitamin B_2) and calcium. Riboflavin was designated officially as a required ingredient of enriched flour after July 1, 1942, and would also be required in enriched bread.

Since more than 95% of the bread consumed in the U.S. is white bread, the enrichment program was regarded as a significant contribution to improved national nutrition.

The biennial census of manufactures of the U.S. department of commerce showed that in 1939 there were 18,043 establishments making bread and other bakery products. These employed 201,533 wage earners, who were paid $262,001,562. The cost of materials was $567,427,173, and the total value of products amounted to $1,211,023,755. Of the entire number of baking establishments, 2,569 were wholesale only, 8,978 were retail only and 6,496 were both wholesale and retail. (*See* also FLOUR AND FLOUR MILLING.)

(J. A. TO.)

Brett, George Howard

(1886–), U.S. army officer, was born Feb. 7 in Cleveland, O. A graduate of Virginia Military institute in 1909, he was a major during World War I, retiring from active service in 1920. He later returned to the army, specialized in military aviation, and won his rating as a command pilot. In Oct. 1940, he was promoted to the rank of major general. Prior to U.S. entry into World War II, Gen. Brett visited the middle east and Britain to co-ordinate British and U.S. aircraft production. After Japan attacked U.S. Pacific possessions, Gen. Brett, British General Wavell (*q.v.*) and Generalissimo Chiang Kai-shek (*q.v.*) set up a military council in Chungking for common prosecution of the war against Nippon. On Jan. 3, 1942, when President Roosevelt and Prime Minister Churchill made Gen. Wavell supreme commander of Allied forces in the far east, Gen. Brett was appointed deputy supreme commander for the region.

Brewing and Beer. The generic word beer covers the malt beverage group including beer, ale, porter, etc. In 1941 the product was manufactured in 39 states and sold in the U.S. in all of the states under regulation and licence. It is taxed by the federal and state governments, and in scattered cases local taxes are imposed. Aside from taxation, control is vested in the states, which generally treat beer distinctly from liquors because of its low alcoholic content.

The industry's production and sales statistics are based on United States internal revenue reports of tax-paid withdrawals (sales) based on the United States fiscal years ending June 30. As cited here, the reports cover the period since beer's re-legalization by act of congress effective April 7, 1933 (which preceded the effective date of repeal of the prohibition amendment by 8 months). On Dec. 31, 1941, there were 510 breweries in the U.S. as compared with the peak of 750 in 1935.

Sales Records.—Following are the sales records in United States barrels (31 gal.) by fiscal years ending June 30th: 1933 (85 days) 6,277,728; 1934, 32,266,039; 1935, 42,228,831; 1936, 48,759,840; 1937, 55,391,960; 1938, 53,926,018; 1939, 51,816,874; 1940, 53,014,230; 1941, 52,289,348.

Monthly federal reports, subject to minor corrections after final audit, show tax-paid withdrawals for the six months July-Dec. 1941 totalling 31,388,000 barrels. This marks a decided increase and gives an estimated barrelage of 57,000,000 for the calendar year 1941. Per capita consumption was 13·5 gal. in the calendar year 1941 as compared with 12·5 gal. in the calendar year 1940.

Industry features of the calendar year 1941 included: Sales increases of 5,200,000 bbl. over 1940 as the national income increased; payment during the full year of the additional emergency tax of $1 per barrel for national defense (total federal tax $6 per barrel); industry activities to "clean up or close up" law-violating retail outlets and expansion of this program to include areas around the army camps throughout the United States.

Law Observance.—The industry's nation-wide program, being conducted through the United Brewers Industrial foundation, with committees of brewers and beer distributors applying it intensively in 14 states, worked directly with retailers and the public authorities to protect the good repute of beer and brewing from abuse by a minority of law violators. These committees reported more than 40,000 inspections of retail outlets to the end of 1941, and about 4,800 warnings resulting in more than 2,000 voluntary corrections of improper conditions and another 2,000 licence revocations and other legal actions.

In addition, an "army camp area" program covered 35 of the 37 states in which there were large concentrations of troops in training, including 12 of the 14 states mentioned above. This program for camp and training areas, directed by the foundation, brought co-operative effort of brewers, wholesalers, retailers and their associations to work with military and civil authorities for the maintenance of wholesome conditions where beer is sold. Light beer was sold on military reservations and its availability was commended by Secretary Stimson and other ranking officials as an aid to morale and temperance for troops in training.

Market Conditions.—Package sales, considered significant of increased home use, continued to gain in 1941 when 56% of all beer was sold in bottles or cans. In 1934 the percentage was 25% package against 75% draught.

Taxes.—Federal excise and special taxes on beer for the fiscal year 1941 totalled $322,706,232. Cumulative federal taxes since re-legalization totalled $2,077,408,188. State and local taxes for that period are estimated at $825,000,000, bringing the combined public revenue from beer to approximately $2,902,000,000 for the period from April 7, 1933, to June 30, 1941. A substantial part of this revenue went for national defense and the balance for other public purposes. During 1941 a number of states waived state taxes on beer sold in military reservations.

War Conditions.—In addition to contributing to the war effort through payment of enormous taxes, aiding morale and in other ways, the beer industry used surplus farm crops not required for defense purposes and was virtually noncompetitive with any defense activities. It required no imported raw materials and the export of beer and ale exceeded the imported finished product. Because of the war, world production and consumption reports for this industry were no longer available. (H. Hy.)

Brick. Total shipments of all types of brick were somewhat less in 1940 than in 1939, due mainly to low shipments in the first quarter of the year. No specific figures were available for the year, but from preliminary data it was estimated that common brick declined 3%, face brick 12%, vitrified brick 18%, and hollow tile 11%, but the first half of 1941 gave indications of marked improvement, especially in common and face brick. (G. A. Ro.)

Brick Production in the United States
(In millions)

Type of Brick	1936	1937	1938	1939
Common	2,966.5	3,252.6	2 729.9	4,725.9

Bridge, Contract: *see* CONTRACT BRIDGE.

Bridges, Robert (1858–1941), U.S. editor, literary critic and journalist, contributed to many American magazines under the pen name of "Droch." Born July 13 in Shippensburg, Pa., he was graduated from Princeton, where he was a classmate of Woodrow Wilson. He was assistant editor of the *New York Evening Post*, 1881–87, and then went to *Scribner's* magazine, where he served in a similar post. He was editor of *Scribner's* from 1914 until his retirement in 1930. He died Sept. 2 at his home in Shippensburg.

Bridges. The world's longest spans of the various types in 1941 are listed in the table.

The collapse on Nov. 7, 1940, of the Tacoma Narrows bridge with a main span of 2,800 ft. (the third longest span in the world) directed concentrated study to the problems of aerodynamic oscillations of bridges. The insurance claims were settled for $4,000,000, and plans were being made for rebuilding the bridge.

The world's longest double-leaf bascule span (*see* table) at Sault Ste. Marie, Mich., collapsed on Oct. 7, 1941, dropping a locomotive into the canal below, with the loss of two lives. The

World's Longest Spans

Type	Bridge	Location	Year	Span
Cable Suspension	Golden Gate	San Francisco	1937	4,200 ft.
Eyebar Suspension	Florianopolis	Brazil	1926	1,114
Cantilever	Quebec	Canada	1917	1,800
Steel Arch	Kill van Kull	New York	1931	1,652
Continuous Truss	Duisburg	Germany	1935	839
Wichert Truss	Homestead	Pittsburgh	1937	533½
Continuous Girder	Mangfall	Germany	1935	354
Simple Truss	Metropolis	Ohio river	1916	720
Concrete Arch	Esla	Spain	1940	645
Vertical Lift	Cape Cod canal	Massachusetts	1935	544
Swing Span	Fort Madison	Mississippi river	1927	525
Bascule	Sault Ste. Marie	Michigan	1914	336
Masonry Arch	Plauen	Saxony	1905	295

cause of the failure was unknown.

A notable concrete arch bridge at Esla, Spain, was completed in 1940 with a span of 645 ft., establishing a new world record for concrete arches. The construction was in an advanced stage, scheduled to be completed in 1935, when the Spanish revolution interrupted the work for five years. The prior record for concrete arches was held by the Plougastel bridge over the Elorn river at Brest, France, with a span of 612 ft., completed in 1930.

Despite the war, or as a military necessity, a new highway suspension bridge over the Rhine at Rodenkirchen was completed by the nazis in 1940. Its main span of 1,246 ft. was in 1941 the longest bridge span on the European continent. Another new suspension bridge built by the nazi regime is the Reichsbruecke over the Danube at Vienna, completed 1937, with a main span of 793 ft.

The Story bridge over the Brisbane river, Queensland, with a cantilever span of 924 ft., was completed July 6, 1940, at a cost of £1,600,000. It is a government-owned toll bridge and the second longest span in Australia.

A new suspension bridge near Victoria, Australia, completed 1941, with a main span of 550 ft., has rocker towers and novel anchorages in clay. One anchorage is an open, ribbed, concrete box; the other is a pier in the water, with the horizontal component of the cable pull being taken by the approach girders.

The Rainbow bridge at Niagara Falls, with a 950-ft. steel arch (the longest hingeless arch span in the world), was completed Oct. 1941, at a cost of $4,000,000. It is a publicly owned toll bridge, replacing the old privately owned arch bridge of 840-ft. span, which was wrecked by the ice in Jan. 1938. The new arch was erected with the aid of a cable tieback system, employing the strands originally used as the temporary footbridge ropes for the Golden Gate bridge.

The new highway bridge at St. Georges over the Chesapeake and Delaware canal, under construction 1940 to 1941, is a steel tied-arch of 540-ft. span. It replaces a vertical lift bridge wrecked by a ship collision in Jan. 1939.

The longest arch bridge in Colorado, 420 ft. long and 209 ft. above the river, was completed Aug. 1940. It spans the Eagle River canyon and straddles an old low-level highway bridge, which latter in turn spans the river and the railroad tracks below. Carrying a concrete deck on two steel arch ribs, it was built by the Colorado state highway department to eliminate a dangerous stretch of mountain road.

The Meramec River bridge near St. Louis, Mo., completed 1941 with a main span of 264 ft., is of novel design. It is a continuous tied-arch, the only bridge of this type in the United States.

The Howrah bridge over the Hooghly river, India, under construction 1938 to 1941, is a cantilever bridge costing £1,750,000.

The world's highest bridge piers—concrete piers up to 360 ft. tall—are in the Pit River cantilever bridge, in California, completed 1941, with a main span of 630 ft. Carrying a railroad on the lower deck and a highway on the upper deck, the bridge was made necessary by the construction of the Shasta dam, located eight miles downstream on the Sacramento river, whereby water will be backed up to a height of 400 ft.

A new cantilever bridge at New London, Conn., under construction 1941 to 1942 at a cost of $6,000,000, with a main span of 540 ft., was to carry an express highway over the deep tidal estuary of the Thames river.

The new bridge over the Connecticut river at Hartford, under construction 1940 to 1942, was to have three continuous steel girder spans of 270, 300 and 270 ft., respectively, establishing a new record for the longest continuous girder span in the United States. During the erection of the first span, at the Hartford shore, a falsework failure on Dec. 4, 1941, caused the loss of 15 lives.

Three notable vertical lift bridges were completed in 1941: A 365-ft. span flanked by towers 200 ft. high over the St. Johns river at Jacksonville, Fla.; a 332·5-ft. span over the Passaic river in New Jersey; and a double-deck 224-ft. span, with towers 207·5 ft. high, carrying railroad and U.S. Highway No. 1 over the Piscataqua river between Portsmouth, N.H., and Kittery, Me.

In the new Kentucky River bridge at Clay's ferry, Ky., a continuous truss bridge with spans of 320, 448 and 320 ft., respectively, under construction 1941 to 1942, the tallest pier is 205 ft. high.

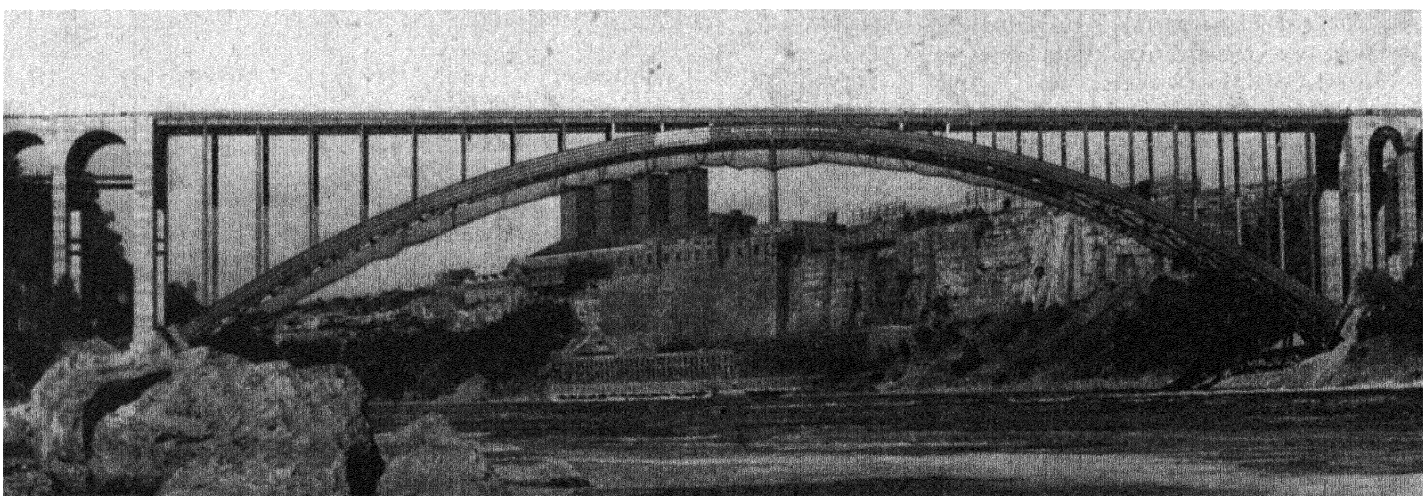
A novel bridge at Santa Paula, Calif., completed June 1940, is a cellular girder of reinforced concrete, with a clear span of 120 ft. It is only 2 ft. 9 in. deep at mid-span, a new record for slenderness of such spans. By using the rigid frame type with counterweighted abutments, the bending movements were reduced to one-fourth the usual amount.

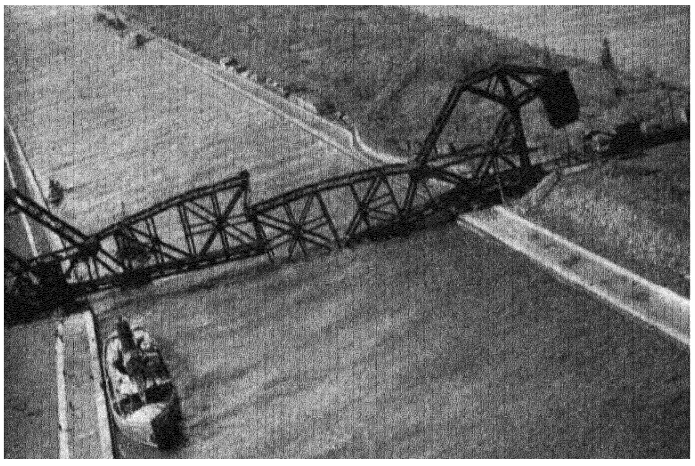
The artistic bridge awards of the American Institute of Steel Construction for bridges completed in 1940 went to the Susquehanna River bridge at Havre de Grace, Md., containing 36 Wichert continuous trusses and girders, including two 456-ft. spans of arch outline; the Dunning Creek bridge on the Pennsylvania turnpike, comprising six continuous girder spans with arched lower flanges; a suspension bridge of 360-ft. span over the Klamath river in California; and the Oceanic bridge over the Navesink river in New Jersey, a double-leaf bascule of 98-ft. span.

The Santa Fe Railway bridge at Los Angeles, built in 1901, was wrecked March 4, 1941, by high water causing overturning or settlement of one pier with the consequent collapse of a 200-ft. truss span and a 90-ft. girder span.

A notable cantilever bridge at Cernavoda, Rumania, built in 1896 with a main span of 623 ft., was crippled by military operations in World War I and was subsequently rebuilt, only to be

RAINBOW BRIDGE at Niagara Falls, shortly before its dedication in the fall of 1941





COLLAPSING end of a freight train, a bridge over St. Marys Falls canal at Sault Ste. Marie, Mich. fell into the canal Oct. 7, 1941 and held up many ore-laden freighters. The locomotive and tender sank into the canal; two trainmen were drowned

wrecked again, more seriously, in 1941.

In Great Britain aerial bomb damage to both highways and railways was surprisingly low, and relatively few bridges were hit. In instances where there was a hit, the bomb as a rule merely punctured the deck, exploding in the water or mud beneath, with very little damage to the structure. (D. B. S.)

Briquettes, Fuel: *see* FUEL BRIQUETTES.
British Borneo: *see* BORNEO.

British Columbia.

Bordering on the Pacific ocean, British Columbia is the most westerly province of the dominion of Canada. Area, 366,255 sq.mi., of which about 8% is considered to be agricultural land. The forest and mining industries flourish over much of the remaining heavily timbered and rugged terrain. The population of the province, 809,203 persons (1941), is concentrated in the southwestern corner, mainly in the cities of Vancouver, Victoria and New Westminster. The greater part of Canada's oriental population is resident in this province, comprising about 90% of the Japanese (23,428, nearly half of whom are Japanese nationals) and 60% of the Chinese (20,500).

History.—In Jan. 1941, at the invitation of the dominion government, delegates of the provincial government attended a dominion-provincial conference in Ottawa, called to consider the adoption of Plan One as submitted by the Rowell-Sirois commission on dominion-provincial relations. At the conference, T. D. Pattullo, premier of British Columbia, declined to accept the Sirois plan as the sole basis for discussion on the ground that the plan would, if implemented, place the province permanently in an adverse financial position. The premier, who had been consistently opposed to the suggestion that the provinces should withdraw from the income and inheritance taxation fields in favour of the dominion, also contended that centralization of economic control in the dominion government would be unduly increased under the plan. Returning to Victoria, after Prime Minister King had closed the two-day conference in the face of active opposition from three provincial governments, Premier Pattullo and his Liberal government encountered severe press criticism. In June, J. L. Ilsley, dominion minister of finance, submitted a compromise plan to the provincial governments. Offering compensation, Ilsley asked all provinces to withdraw from the income and inheritance tax fields for the duration of the war. Seeking reelection in October, the Liberal government announced its intention to accept the compromise plan if returned to office. In the election of Oct. 21, the Liberal administration failed to obtain a majority in the legislative assembly; there were elected 21 Liberals, 14 Co-operative Commonwealth Federationists, 12 Conservatives and 1 Independent Labourite. Favouring a coalition government and dissatisfied with Premier Pattullo's decision to form a new minority Liberal government, four members of the cabinet resigned. Failing to secure support for his policies, Premier Pattullo resigned as leader of the Liberal party Dec. 2. When the legislative assembly convened Dec. 4, Premier Pattullo announced the resignation of his cabinet. No legislation was introduced during the single day session of the assembly, which was adjourned until Jan. 8, 1942. Called by Lieutenant Governor W. C. Woodward to form a government, the new provincial Liberal leader, John Hart, announced the formation of a Liberal and Conservative coalition government Dec. 10, indicating that the C.C.F. members had declined an earlier invitation to join in the formation of a union government. The new cabinet, comprising eight ministers, included P. Maitland, leader of the provincial Conservative party, and two other Conservatives; the remaining five portfolios were held by Liberals. The C.C.F. members of the legislative assembly, under the leadership of Harold Winch, constituted the opposition.

Other events during 1941 included the appointment of G. McG. Sloan, puisne justice of the court of appeal, as commissioner to inquire into the administrative policy of the Workmen's Compensation board, in July; the visit of H.R.H. the duke of Kent, and the appointment of W. C. Woodward, Vancouver merchant, as lieutenant governor, in August. In September, a single commissioner, Judge A. M. Millar, was appointed to investigate the operations of the provincial marketing boards. On Dec. 8, as a result of war conditions in the Pacific area, the province experienced its first "blackout."

Manufacturing, Trade, Agriculture, Minerals.—Stimulated by the extraordinary requirements of war, the tempo of business activity increased steadily during 1941. As employment increased, the enlarged purchasing power and rising production costs began to make their influence felt and, during the first nine months of 1941, the cost of living rose sharply—20% above Aug. 1939, in the principal coast cities. The introduction of price and wage control by the federal government in November, together with the dominion wartime taxation measures of the spring, showed signs of restraining this inflationary tendency in the latter part of the year. The important foreign commerce of the province, previously affected but lightly by the hostilities in Europe, showed a minor reduction as a result of the entry of Japan into the war in December. According to preliminary provincial estimates, the value of production amounted to $55,000,000 in agriculture (1940, $51,772,571); $22,000,000 in fisheries (1940, $21,710,167); $118,000,000 in forestry (1940, $102,804,000); and $75,000,000 in mining (1940, $75,352,730). (G. N. P.)

British East Africa.

Under this heading are grouped British colonial territories on the east coast of Africa, of which certain essential statistics are given in the table on page 118. *See* BRITISH EMPIRE for population, capital towns, status and governors. (*See* also RHODESIA.)

History.—The tendency of the East African colonies to unite in common action both for military and civil purposes began with the outbreak of war against Italy in 1940. A joint delegation from the East African colonies went to the Eastern Group conference at Delhi in 1941, the first time that a delegation representative of all sections of the East African territories set out to deal with problems mutually affecting the welfare of all. A war supplies board and a civil supplies board for East Africa were set up, the latter to carry out policy with regard to con-

trol of imports, currency and exchange and supplies for civil needs. The former did excellent work in support of Gen. Alan Cunningham's advance into Italian East Africa from the south. The East African governors met in conference in January. A conference on yellow fever was held in Nairobi, at which there were representatives of the health services of the Sudan, Kenya, Uganda, Tanganyika, Nyasaland, the Rhodesias, South Africa, the Belgian Congo and the military forces of East Africa. The chief recommendation was the extermination of the yellow fever carrier mosquito from all seaports, all urban centres and aerodromes, and all lines of communication.

In the East African campaigns, soldiers from East Africa, South Africa, West Africa and the Rhodesias, white and black, fought together. Officials from some of the East African colonies were made responsible for civil administration in the former Italian colonies.

(*See* WORLD WAR II.)

Kenya.—The governor of Kenya received a visit from the governor general of the Belgian Congo and paid him a return visit. A personal tax was introduced for Europeans and Asiatics in Kenya. A mobile cinema van, to show pictures and give talks to Africans about the war and other matters of general interest was a great success.

Uganda.—Experiments were being made to introduce crops likely to develop secondary industries. Flax and flue-cured tobacco were being grown with this in view. The principal commercial crops had a successful year. Uganda African truck drivers distinguished themselves in the military transport services.

British Somaliland.—This territory, taken by the Italians Aug. 19, 1940, was reoccupied by British forces in March 1941. Berbera, the capital, was captured March 16 by a landing force supported by the navy and the R.A.F. Hargeisa fell a few days later, and the British, joined by empire forces from Italian Somaliland, proceeded to the conquest of Abyssinia.

Tanganyika.—A labour department was set up and a labour commissioner was appointed to deal with the most urgent improvements in labour conditions. The Dar-es-Salaam township authority included lady members, Africans and an unofficial majority. The Masai, a wild and warlike tribe, offered to sell 6,000 head of cattle a year and to divide the proceeds between gifts to the government for war purposes and a development fund for the Masai country. A successful campaign against rinderpest was carried out in co-operation with the veterinary officers of Northern Rhodesia.

Zanzibar.—The sultan of Zanzibar more than once broadcast to his people to support the British cause, emphasizing that the well-being of the Moslem world was bound up with a British victory. The clove industry, on which Zanzibar's prosperity depends, reached a stage where new development was necessary, as large areas of clove trees were reaching the end of their economic life, which is 60–70 years. It was proposed to replant the best lands with cloves, and to use the marginal lands for other export crops such as pineapples.

Regular nursing training for women began—an innovation in a Moslem territory. The first batch of probationers included both Arabs and Africans.

Nyasaland.—The 50th anniversary of the protectorate was celebrated in 1941. Nyasaland Africans were in great demand for the King's African Rifles, as infantrymen and as skilled mechanics and signallers; and the demand for workers on Southern Rhodesian mines and farms was constant.

The native labour association of the Rand mines suspended its recruiting until the military requirements were met and put its organization at the disposal of the Nyasaland government. A junior secondary school, long awaited, was opened at Blantyre. The governor in his opening speech paid tribute to the educational work of the missions.

Mauritius.—A department of education was created, with a director to control the educational system of the country. One of the objectives is the better teaching of English and the spread of the English language.

Special programs were introduced in Hindustani for the Indian population to counteract the German Hindustani radio propaganda. (M. RD.)

British Empire. The governments of the British empire and the governors and premiers were as follows as of Dec. 1, 1941:

Country	Area Sq. miles (approx.)	Population (000's omitted) (est. 1938)	Capital	Status	Governors and Premiers
Europe					
Great Britain and Northern Ireland	93,091	47,600	London	Kingdom	George VI, King-Emperor. *Prime Minister* of Great Britain: Winston Churchill. Governor of Northern Ireland: The Duke of Abercorn. *Prime Minister* of Northern Ireland: J. M. Andrews.
Channel Islands	75	96	St. Helier / St. Peter Port	Kingdom of Great Britain and N. Ireland	*Jersey:* Maj. Gen. J. M. R. Harrison. *Guernsey:* Maj. Gen. A. P. D. Telfer-Smollett.
Eire	26,601	2,934*	Dublin	Dominion	*President:* Dr. Douglas Hyde. *Prime Minister:* Eamon de Valera.
Gibraltar	2	20	Gibraltar	Colony	General the Viscount Gort.
Isle of Man	227	49	Douglas	Kingdom of Great Britain and N. Ireland	Vice-Adm. Lord Granville.
Malta	122	269	Valletta	Colony	Lt. Gen. Sir W. G. S. Dobbie.
Asia					
Aden, Perim, etc.	80	48	Aden	Colony	Sir J. Hathorn Hall.

*Pop. est. 1939 †Pop. est. 1941

British Guiana, a British crown colony in northeastern South America. Area, 89,480 sq.mi. The population (1931 census: 310,933; 1938 official est.: 337,521) is largely East Indian (42%) and Negro (38%). East Indians are numerically greater than in any other American area except Trinidad, and proportionately more than in any except Surinam. The chief cities are Georgetown, the capital (67,584) and New Amsterdam (9,514). Bartica, main outlet of the diamond and bauxite areas, was rapidly growing in importance in 1941. Governor in 1941: Sir Gordon Lethem (succeeded Sir Wilfred F. Jackson July 4, 1941).

History.—Throughout 1941, constitutional reforms involving broadening of the franchise and other changes were under discussion. A new labour code, with minimum-wage provisions, was also in preparation. In July the United States formally took over the bases acquired under the "destroyer-base exchange" agreement of Sept. 1940: a seaplane base near Suddie, at the mouth of the Essequibo river, and Atkinson field, a patrol plane and squadron base, with a 4,708 ac. aerodrome, on the Demerara river, 25 mi. from its mouth.

The colony continued to feel the economic effects of World War II, with reduced diamond and other exports, but higher sugar and bauxite returns. Contributions and loans in support of the imperial war effort were made on an increasingly large scale.

Education.—In 1938 British Guiana had 239 primary schools, with an enrolment of 53,373, and seven secondary schools.

Finance.—The monetary unit is the British Guiana dollar, tied to the pound sterling at 4.8665 and normally equal to the United States dollar (1941 value: 83¼ cents U.S.).

Trade.—In 1940 imports (primarily foodstuffs, textiles and miscellaneous manufactured goods) increased 26.8%, to $14,337,242 (all values in British Guiana dollars), with a further 10% rise in the first eight months of 1941. Under wartime regulations, no public report was made of bauxite exports (19.7% of the 1939 total). Exports in 1940 (except bauxite) were $10,479,100, 4% less than the full 1939 figure. The principal exports were sugar, 142,707 tons (68% of export value); gold, 33,058 oz. (9.9%); rum, 1,811,535 gal. (7%); rice, 11,676 tons (6.7%); diamonds, 17,559 carats (2.6%). Timber (2%), molasses (1.9%) and balata (1.5%) were also important. Export values in the first eight months of 1941 ($6,560,470) were 80% from sugar.

Communication.—External communication is good, with frequent steamship and air transport service. Within the colony, however, railways (79 mi. in 1941) and highways (322 mi.) are practically restricted to the coastal plain. Except for some roads to the diamond centres and a 300-mi. cattle trail to the far interior, interior communication is primitive and entirely by navigable rivers. Improvement of waterways and other communication, however, was the subject of several intensive studies after 1939.

Resources.—British Guiana is, essentially, an undeveloped region. Agriculture is restricted to the coastal plain, with the chief crops sugar (70,622 ac.; 1939: 189,245 tons; 1940, 167,645 tons) and rice (72,132 ac.; 1939: 67,314 tons; 1940: 51,580 tons). The annual wage of sugar estate labourers alone is well over $5,000,000 (1940: $5,177,780; Jan.–Aug. 1941: $5,319,549). Coco-nuts (25,000 ac.), pineapples and some coffee (annual export: 25,000 lb.) are also grown.

Bauxite, diamonds and gold are the leading minerals. In 1941, bauxite was being developed at a rapid pace, and although no statistics were published, on the basis of Surinam's experience (*see* SURINAM), 1941 production may be presumed to have at least doubled that of 1939.

Forests cover 87.4% of the colony's area, with extensive stands of valuable greenheart and other hardwoods, and were all but undeveloped in 1941. Balata, for machine belting, and some tree gums are also collected. The interior highlands have great possibilities for white settlement, but lack of communications has kept them virtually unoccupied. Several rivers are potential sources of hydroelectric power on a large scale; Kaieteur falls, on the Potari river, is estimated to have a greater potential capacity than has Niagara. (L. W. BE.)

British Honduras, British crown colony in northern Central America bordered by Guatemala on the west and Mexico on the north. Area, 8,598 sq.mi. The boundaries with Guatemala were settled in 1859; Guatemala, however, officially reopened the question early in 1939, but two years later formally announced it would not be pressed for the duration of World War II. The population by the 1931 census was 51,347, and was officially estimated at 58,759 as of Dec. 31, 1939. The capital is Belize (1931 pop.: 16,687).

History.—The year 1941 was marked by considerable unemployment and consequent economic depression, the direct effect of war disruption of the colony's trade. In November a hurricane destroyed an estimated 45% of the still-unpicked citrus crop. Meanwhile, efforts were directed especially toward increased production of foodstuffs, particularly beans, corn and rice, with the object of reducing importations.

Education.—The colony had 106 elementary schools in 1941, with a total enrolment of more than 10,000, and five secondary schools, with nearly 500 enrolment.

Finance.—The monetary unit, the British Honduras dollar, is valued at 4.8665 to the pound sterling, and normally is equivalent to the United States dollar, with a 1941 exchange value of around 83 cents U.S.

Trade.—In 1940, exports were valued at 3,039,505 British Honduras dollars (1939: 2,519,674); imports at 3,318,070 (1939: 3,532,059). Imports are chiefly foodstuffs (1940 value: 521,939 British Honduras dollars), textiles, machinery and other manufactured goods. Imported foodstuffs comprised flour and condensed milk especially (28% each), and rice, beans and peas, pork and lard. The colony serves as an important trade intermediary between adjacent sections of Mexico and the outside. In 1940, re-exports aggregated 47.3% of all exports. In 1940 domestic exports were valued at 1,620,680 British Honduras dollars, with forest products 82% (79.6% over an 18-year period). In 1939 mahogany logs, mahogany timber and chicle represented 31.5%, 18.5% and 20.3%, respectively, of all domestic

exports. Agricultural products were 17.75% of all domestic exports, chiefly bananas (9.5%), grapefruit (4.26%), and coco-nuts (2.73%). Banana production (1939: 522,578 stems; 1940: 437,432) was taken entirely by the United States, as was most of the coco-nut crop; grapefruit was taken by Great Britain and Canada. Marine products (sponges and tortoise shell) represented 0.25% of 1940 exports.

Communication.—Belize has regular steamer service to New Orleans, Kingston and Tampa. Central American Air Transport (TACA) provides a semiweekly service from San Pedro Sula, Honduras, to Belize and other points. Navigable rivers handle considerable domestic traffic. The colony had one 25-mi. railway in 1941, primarily used for logging; and 185 mi. of improved highway, but few subsidiary roads.

(L. W. Be.)

British Legion. The organization and machinery of the legion, extended to cater for the needs of the men of World War II as well as of World War I functioned to its full extent, and by mid-1941 there were more than 12,000 cases from the war in progress on the books. Its representatives on the ministry of pensions' central advisory committee did much successful work in connection with the redrafting of the royal warrant relating to compensation for death and disablement in the war in progress, and in other matters; a special committee studied the whole problem of demobilization and resettlement; and, at the request of the war office, a scheme was prepared for the organization of the sons of veterans of World War I as air force cadets. For 1941 the principal officers, including Major Gen. Sir Frederick Maurice, president, and Col. A. S. L. Ashwanden, chairman, were re-elected.

Amended figures for Poppy day 1939 collection showed that it reached the record of £596,102; in 1940 it amounted to £595,200, making since 1921, when the appeal was first launched, a grand total of nearly £8,836,000. Both the main body of the legion and its women's section presented numerous mobile canteens to the Queen's Messenger convoys and to the London county council for London's homeless.

British Pacific Islands: *see* Pacific Islands, British.

British Possessions in the Mediterranean.

These comprise Gibraltar, the Maltese islands and Cyprus, of which the table below gives certain statistics. (*See* also British Empire.)

History.—During 1941 these islands played an increasingly prominent part in the war, especially Malta, the possession of which became of immense importance to both sides, for it lies athwart the direct route between the axis powers and their North African outposts.

The defense of Gibraltar had been completely modernized by May 1941. By August almost the entire civil population had been evacuated. Though extra precautions had to be taken in the spring on reports that Germany was seeking permission to send five divisions through Spain to attack the garrison, relations with the Spanish government remained friendly. In May there was an attack on the Rock—with great loss to themselves—by airmen (reported to be French) from French Morocco; in July Italian planes, intending to attack it, bombed instead La Linea, on the other side of the Spanish frontier, and in September some Italian torpedo boats did slight damage in the harbour. The duke of Gloucester paid the garrison a six days' visit in October.

During the year Malta was not only on the defensive as a naval and fleet air arm base, but became more and more a base for offensive operations. This island bore the brunt of enemy action in the Mediterranean. The defenses of Malta are exceptionally strong, its buildings are mostly of stone and Valletta is well provided with ancient subways in the rock. Although the island had been subjected to 773 raids by the end of July 1941, casualties among civilians were comparatively small, amounting to 316 killed and 265 seriously injured. The law courts and many churches and convents were destroyed, and St. John's cathedral was damaged.

Compulsory service was introduced for all males in February—military from 18 to 41, and nonmilitary from 16 to 56. In March increased taxation was announced; the deficit for 1940–41 was met by an imperial grant of £1,000,000; and the deficit for 1941–42 was estimated at £662,000.

Though Cyprus did not experience its first air raid till the middle of May, it had taken an active part in the fighting from the start. The first colonial troops in France were from the Cyprus regiment and Cypriots formed part of the British forces in Greece. The withdrawal from Crete (end of May) brought the threat of invasion nearer. The garrison was heavily reinforced by British and Imperial troops, and by September armoured detachments, artillery and anti-aircraft defenses had brought it up to full strength. Desultory bombing, causing little damage, took place from the beginning of July, but before the end of June the evacuation of women and children and all civilians (including 500 Polish refugees, many Jews from central Europe and some U.S. mining engineers) was complete. Cyprus suffered from a severe earthquake in January.

Expenditure for 1941–42 was estimated at £1,082,713; an income tax was imposed for the first time, and the taxes on tobacco, spirits and beer were raised. (L. H. D.)

neer corps for service in the middle east. All the protectorates gave generously to war funds in 1941.

Basutoland.—The paramount chief died after only one year's reign in which he had already shown the qualities of a great ruler. His principal wife was appointed regent on the advice of the council of chiefs during the minority of the heir. In a speech of greeting to the high commissioner, she expressed the readiness of the Basuto for any sacrifice to help Britain win the war. Basutoland had already given £150,000 to war funds.

Bechuanaland.—Girls' education was progressing much faster than boys', because boys were sent to mind the cattle at outposts for part of the year. Cattle post schools, staffed by itinerant teachers, had been developed to meet this situation.

(M. RD.)

British West Africa. Under this heading are grouped the British colonial territories on the west coast of Africa, for which certain essential statistics are given in the table on this page. *See* BRITISH EMPIRE for population, capital towns, status and governors. (X.)

History.—A conference of West African governors was held at Accra, and subsequently a secretariat for the conference was established in Lagos. The co-ordination of supplies for civil and military needs in British West Africa was to be one of the tasks of this office. It was announced in the official gazette that the cocoa control scheme was being operated in the interests of large populations in the Gold Coast and Nigeria who were dependent on cocoa for a livelihood. A draft was published of a workmen's compensation bill, uniform for the West African colonies, which was to come into operation shortly.

West African troops distinguished themselves in the East African campaign; and as soon as it was announced that Africans could join the R.A.F., applications began to come in; 350 were received within two months. Great interest was expressed in the fortunes of the Free French forces and especially in the appointment of M. Eboué as governor of French Equatorial Africa. Direct contact was made with the Free French territories in Africa when Gen. de Gaulle (*q.v.*) paid an official visit to Lagos. A weekly air-mail service between Lagos and the Free French and Belgian territories was operating at the end of 1941.

Nigeria.—Lagos is an important airport as well as seaport. It is the flying boats' southern terminal and the base for land planes to Khartoum and Cairo. Increases were authorized in grants to agriculture and education and a new forestry school was opened. The information office, which is almost a public relations office, works through the press, cinemas (including six mobile vans), broadcasting and literature. Secondary industries were being developed to use local products; notably there was a cassava starch industry and industries undertaking the processing of sugar, twine and castor oil.

Gold Coast and Cameroons.—There were 16 rediffusion stations in 1941 used for BBC and local broadcasts. The radio station at Accra serves Nigeria and Sierra Leone as well as the Gold Coast and the neighbouring French territories. The cocoa crops which form the chief industry in the Gold Coast were bought by the British government. The Nigerian agriculture department was responsible for maintaining former German plantations in the Cameroons.

Sierra Leone.—The government laid in large stocks of rice to meet a possible shortage, and in spite of an increased demand from people employed on war work, normal supplies were available on the market. A committee appointed to inquire into the cost of living included 8 African women out of 14 members.

Gambia.—There were large exports of ground-nuts and at the same time local food crops increased considerably so that the territory was nearly self-supporting. The British government promised to buy up to 45,000 tons of ground-nuts. A labour advisory board was appointed to advise the governor on matters concerning labour conditions. (M. RD.)

British West Indies: *see* WEST INDIES, BRITISH.
Broadcasting: *see* RADIO.

Bromine. The United States bromine production jumped from 37,882,000 lb. in 1939 to 59,266,000 lb. in 1940, and probably increased still further in 1941. Germany, France, Palestine and Italy all produce material amounts, and there are other minor outputs, but the United States usually accounts for more than 80% of the world total. (G. A. RO.)

Brooke, Sir Alan Francis (1883–), British army officer, was born at Baguères de

Bigorre, France, on July 23, the son of Sir Victor Brooke. After completing his studies at the royal military academy, Woolwich, he joined the royal field artillery in 1902. He was stationed in Ireland from 1902 to 1906, then India. At the outbreak of war in 1914 he went to France, where he commanded an ammunition column. Advancing rapidly, he was soon recognized as a foremost British authority on artillery and was a general staff officer of the royal artillery at the time of the armistice. After the war he joined the staff college, Camberley, and the imperial defense college, and from 1929 to 1932 he was commandant of the school of artillery. After duty at various other military posts he was appointed in 1939 commander-in-chief of the anti-aircraft command. When Germany invaded the Low Countries on May 10, 1940, Brooke was commander of the B.E.F. 2nd corps in France. His guarding of the British retreat from Flanders was an important factor in the successful evacuation at Dunkirk. Back in England early in June, he hastily reassembled British military manpower for the expected nazi invasion and prepared a formidable series of defense zones. For his work in Flanders he was knighted, and on July 19, 1940, he was appointed to succeed Sir Edmund Ironside as commander-in-chief of the home forces.

On Nov. 18, 1941 Brooke was appointed chief of the British imperial general staff to succeed Sir John Greer Dill. Lieut.-Gen. Bernard C. Paget (*q.v.*) was named to succeed Brooke as commander-in-chief of the home forces.

Brooke-Popham, Sir Robert (1878–), British air officer, was born Sept. 18 in Mendelsham, Suffolk, Eng. Educated at Haileybury and Sandhurst, he entered the army in 1898; in 1912, he helped establish the air battalion of the royal engineers, a "freak" unit that was the forerunner of the R.A.F. During World War I, Sir Robert was one of the first six British pilots to fly over German lines, and was frequently cited for bravery. After the war, he was commandant of the R.A.F. staff college, 1921–26; head of the Iraq air command, 1928–30; air chief marshal, 1935; and inspector-general of the R.A.F., 1935–36. He retired from the army in 1937 to become governor general of Kenya, but returned to the R.A.F. as air chief marshal when Germany invaded Poland in Sept. 1939. In Nov. 1940, he was appointed commander-in-chief of British forces in the far east, but was removed from this command on Dec. 27, 1941, after he failed to stem the Jap invasion of Malaya. Sir Henry Royds Pownall (*q.v.*) succeeded him.

Brookings Institution. While the research activity of the institution in 1941 covered a broad area in economics and government, a substantial part of the program dealt primarily with problems arising from national defense. Among the studies published were the following: *Nazi Europe and World Trade,* by Cleona Lewis, an investigation of the import and export trade requirements of a possible post-war Germany which would embrace the entire continent of Europe; *Congressional Apportionment,* by Laurence E. Schmeckebier, dealing with the apportionment of representatives in congress, both among and within the states; *Government of Montgomery County, Maryland,* a study of a typical metropolitan-area residential county; *Air Mail Payment and the Government,* by F. A. Spencer, an analysis of the development and status of air mail compensation in relation to the regulation of air traffic rates; *The Presidents and Civil Disorder,* by Bennett M. Rich, a historical and analytical account of executive action to quell domestic disturbances. Pamphlet studies included the following: *Government in Relation to Agriculture,* by Edwin G. Nourse; *Fundamental Economic Issues in National Defense,* by Harold G. Moulton; *Effects of the Defense Program on Prices, Wages and Profits,* by Meyer Jacobstein and Harold G. Moulton.

Fifteen fellowships for work in the social sciences were granted to advanced graduate students for the scholastic year 1941–42. Headquarters of the Brookings institution are at 722 Jackson place N.W., Washington, D.C. (H. G. Mo.)

Brooklyn-Battery Tunnel: *see* TUNNELS.

Brower, Gerald (? –1941), U.S. colonel, was born in Brooklyn, N.Y. A graduate of Cornell university, he joined the A.E.F. in World War I. After the war he became interested in aviation and attended the Air Service Field Officers' school, the Air Service Engineering school and the Army War college. In 1940 Colonel Brower was sent to Egypt as an official U.S. air observer with the British air forces in the middle east. He was killed in a plane accident at El Obeid, near Khartoum, April 20.

Brown, Carleton Fairchild (1869–1941), U.S. philologist and educator, was born July 15 at Oberlin, O. Ordained a Unitarian minister in 1894, he spent six years in the clergy and then returned to school, studying at Harvard university, where he received his Ph.D. degree in 1903. Subsequently he taught at Harvard, Bryn Mawr, the University of Minnesota and New York university. He was the author of *A Study of the Miracle of Our Lady Told by Chaucer's Prioress* (1910). He died at Montclair, N.J., June 25.

Browne, Dame Sidney Jane (1850–1941), British nurse, known as the "modern Florence Nightingale," was born Jan. 5. She served as nurse in the Egyptian War, 1884; the Sudanese campaign, 1885; the Boer War, 1899–1902 and during World War I. Dame Browne was first president of the College of Nursing and received an honorary doctor of nursing degree from Leeds university. She was awarded the International Florence Nightingale medal by the League of Red Cross societies and the Royal Red Cross in the Boer War. In 1919 she was created Dame of the Grand Cross Order of the British Empire. Dame Browne died in Cheltenham, England, Aug. 13.

Brunei: *see* BORNEO.

Brush, George De Forest (1855–1941), U.S. painter, was born Sept. 28 at Shelbyville, Tenn. Brush won recognition for his portrait studies of American Indians and his family portraiture. His work, highly prized by collectors, often brought high prices. In 1920 his canvas, "At the Fountain," was bought by a collector from the Milch galleries for $18,000. In 1937 his painting of a little girl in a crimson bonnet was sold for $1,250, nearly four times the sum paid for a larger Gainsborough painting sold at the same time by the American Art Association Anderson galleries. An artist of the traditional school, Brush disliked the modern trend in art. He continued to paint in his later years but did not exhibit often. His "Family Group" is in the Art institute, Chicago; "Henry George" in the Metropolitan museum, New York city; "Portrait of a Lady" in the Carnegie institute, Pittsburgh and "The Moose Chase" in the National gallery, Washington, D.C. Brush died in Hanover, N.H., April 24. (See *Encyclopædia Britannica.*)

Bryn Mawr College. A resident college for women at Bryn Mawr, Pa. The 1941–42 enrolment of 666, largest in the college's history, included 163 graduate students and 503 undergraduates. The faculty and teaching staff

numbered 89. President Marion Edwards Park, having reached the retirement age in 1941, was to be succeeded by Katharine E. McBride, dean of Radcliffe college. The close co-operation with Haverford and Swarthmore colleges progressed to such an extent in 1941 that all faculty appointments were to be discussed jointly by the three college presidents before making any appointments, without limiting the complete autonomy of any of the three institutions. A special research project in the graduate school of Bryn Mawr was offered in 1941 in a joint seminar in political science, on the subject, "International Relations: A Stable World Order." The Anna Howard Shaw lectures, given by a visiting lecturer, were also on the subject of international relations. The Mary Flexner lectures were on the art of archaic Greece. (M. E. Pa.)

Bubonic Plague: *see* Plague, Bubonic.

Buckwheat. Production of buckwheat in the United States in 1941 was estimated by the department of agriculture as 6,392,000 bu., compared with 6,350,000 bu. in 1940, and a ten-year (1930–39) average of 7,315,000 bu. The acreage was 357,000 in 1941. In 1940 it was 393,000 ac.; the ten-year average, 460,000 ac. Yield per acre was 17·9 bu., compared with 16·2 bu. per acre in 1940 and a ten-year average of 16 bu.

Estimated U.S. Production of Buckwheat in Leading States, 1941 and 1940

State	1941 bu.	1940 bu.	State	1941 bu.	1940 bu.
Pennsylvania	2,300,000	2,118,000	Wisconsin	188,000	162,000
New York	2,282,000	2,194,000	Virginia	176,000	195,000
West Virginia	254,000	245,000	Maine	144,000	120,000
Minnesota	210,000	242,000	Maryland	84,000	95,000
Michigan	208,000	310,000	North Carolina	64,000	56,000
Ohio	192,000	288,000	Indiana	52,000	94,000

(S.O.R.)

Budenny, Simeon Mikhailevich (1876–), Russian soldier, was born April 25 in Koziurin, in the Don basin, the son of a Cossack farmer. (See *Encyclopædia Britannica.*) Although a high official in both the Russian government and the army, he had had no formal schooling until he entered the Moscow military academy in 1928, from which he was graduated with honours in 1932. Budenny, who became a marshal of the soviet union in 1935, was made commander-in-chief of the Moscow district in 1937. He played an outstanding role in the final victory over the Finns in 1940, and in Aug. 1940, he was made first vice-commissar of defense. In July 1941, after the outbreak of war with Germany, he was appointed commander-in-chief of the Russian armies defending Kiev and the Ukraine. Following Stalin's "scorched earth" policy, Budenny's retreating armies blew up the huge Dnieper river dam in Aug. 1941. He was shifted from the southern front Oct. 23, 1941 and was charged with formation of new Russian armies.

Budgets, National. A national budget is an accounting statement of the government's financial transactions for a particular time period. It is customarily presented to the legislature before the start of the fiscal year so that approval of tax and expenditure proposals may be secured. In it, expected revenues of the government are set against proposed expenditures so that the deficit or surplus anticipated is clearly shown. The budget document also usually includes discussion of the financial condition of the government and recommendations of the many aspects of government fiscal policy. In the course of the depression, and even more after the outbreak of World War II, the budget message tended to become much more than a mere accounting statement. It was used as the vehicle for expressing the government's view of the requirements of the economic situation and of the relation of government fiscal policy to economic and military necessities.

United States.—In the United States, the Budget and Accounting act of 1921 provided for a national budget system and created a bureau of the budget to prepare for the president the budget of the United States government. The act directed the president to submit to congress on the first day of each regular session a budget which presented the expenditures and receipts of the federal government for the fiscal year just completed, estimated expenditures and receipts for the current and ensuing fiscal years, and balanced statements showing the condition of the treasury at the end of each of these periods.

As originally submitted by the president to congress, the federal budget for the fiscal year 1941 did not differ essentially from the actual receipts and expenditures of the fiscal year 1940, shown in Table I. With the necessity for an enlarged national defense establishment demonstrated by the war in Europe, however, that proposed plan of government operations was drastically altered after June 1940. A huge rearmament program was undertaken which grew continuously as the nation endeavoured to become the "arsenal of the democracies." Two revenue acts were also passed which raised various tax rates and imposed an excess profits tax. As a result of these measures, government expenditures in the fiscal year 1941 rose to $12,710,629,823, in contrast with outlays of $8,998,189,706 for the fiscal year 1940. National defense expenditures rose from $1,579,905,421 to $6,301,043,165 over the same period. Despite an increase in revenues of more than $1,600,000,000, the net deficit in 1941 was more than $5,000,000,000 as against $3,611,000,000 for 1940.

As the tempo of the rearmament program was speeded up, and especially after the entrance of the United States into the world-wide struggle on Dec. 8, 1941, these trends of government expenditures and revenues were greatly accelerated. A revenue act

"WE UNDERSTAND ALL THAT." A biological slant on the tax bill of 1941, by Herblock of NEA Service

was passed in 1941 designed to yield more than $3,500,000,000. It imposed excise taxes on a wide variety of commodities, increased taxes on corporate incomes and excess profits, and imposed additional levies on personal income. Under the new personal income tax, the exemption for single persons was lowered to $750 and that for married persons to $1,500, and the levies on the middle income group from $3,000 to $50,000 were sharply increased. For example, the tax on a $3,000 income for a married person was raised from 1% to 4·6% and that on a $10,000 income from 5·3% to 13·1%. These new taxes, along with the increase in government revenues that always accompanies a rising national income, were expected to yield total revenues of almost $13,000,000,000 in fiscal 1942. Expenditures on the other hand were expected to rise to more than $30,000,000,000 and national defense outlays alone to almost $24,000,000,000. The increase in the government's expenditure was expected to leave a deficit of more than $18,000,000,000 which would raise the public debt at the end of the fiscal year to more than $70,000,000,000. (*See* TAXATION.)

Source: Budget statement sent to congress by President Roosevelt on Jan. 7, 1942. Data for 1940 added for comparative purposes. *Excess of credits, deduct. †From new taxes only. The net excess in social security trust funds is estimated to be $2,000,000,000 in 1943 under proposed new legislation.

The full magnitude of the war effort that the president called for to assure the overwhelming power necessary to defeat the nation's enemies in the shortest possible time was revealed in the budget for the fiscal year 1942. The sums involved were truly staggering, constituting the largest program ever envisaged by any nation in the history of the world. Total government expenditure of almost $59,000,000,000 was contemplated for the fiscal year 1943, of which almost $53,000,000,000 were designated for national defense. The mere fact that a war expenditure of this size was expected, was a tribute to the productive resources of United States industry and labour. In order to facilitate the mobilization of the economic resources of the nation for the war effort, the president recommended that various non-defense activities of the government be curtailed, including the civil departments and agencies, the public works program, aids to agriculture and youth and the work relief program. In view of the increase in the national defense necessary to finance a huge war program, it was expected that interest on the public debt would rise by $500,000,000.

On the revenue side of the budget, it was estimated that the gross receipts of the government from existing taxes would total almost $18,000,000,000 in the fiscal year 1943, an increase of about $5,000,000,000 over the previous year and more than double the actual receipts in the fiscal year 1941. In addition to this, the president recommended that new tax measures be imposed to yield $7,000,000,000 and that the Social Security system be broadened so as to yield a further $2,000,000,000. In the aggregate, therefore, total government revenues of $27,000,000,000 were contemplated, designed not only to assist in paying for the war but to assist in preventing an inflationary rise in prices. It was recommended that congress plug up the loopholes in the existing income, estate, gift and profit taxation; that the privileged treatment given certain types of business in corporate income taxation be re-examined, and that the income from all future issues of state, municipal and authority bonds be made taxable. The president also suggested that excessive profits should be recaptured through taxation and that the basis for computing the excess be determined without relation to the level of a corporation's profits before the defense program. But in addition to these measures, the president urged an increase in such taxes as would directly aid in controlling inflation, such as income taxes collected at the source, pay roll taxes and excise taxes, and even suggested that a general sales tax might be necessary in the face of the financial and economic situation. Such taxes were to be considered emergency measures.

In spite of this broad tax program and the record federal rev-

Total	86,417	99,346

*In addition, £8,700,000 was issued to the Post Office from votes of credit in 1940–41 and £4,970,000 was estimated to be so issued in 1941–42.

enues anticipated, it was estimated that the national debt would rise from approximately $70,000,000,000 to more than $110,000,000,000 in the course of the fiscal year 1943, with a gross deficit of more than $35,000,000,000. The president made it clear in his budget message that he did not expect this deficit to be financed by inflationary borrowing but from the funds that would be available because shortages of material would curtail private outlays for consumers' durable goods, for private and public construction, and for expansion and even replacements in nondefense plant and equipment. (*See* also NATIONAL DEBTS; NATIONAL INCOME; UNITED STATES.)

Great Britain.—The British budget for the fiscal year 1941–42 may well be judged the first war budget to be based on the economic requirements of total war. It contained innovations of revolutionary import—not only because of fiscal expedients adopted but because of its clear grasp of the relation between economic and fiscal needs.

In magnitude the budget was the largest in British history, both on the side of expenditures and on the side of receipts. This was the case even though the full extent of the war effort was not revealed, since the figures did not include the value of supplies expected from the United States. However, the chancellor of the exchequer, Sir Kingsley Wood, indicated that the total outlay for the fiscal year would far exceed £5,000,000,000 sterling.

The budget message was concerned not so much with the purely bookkeeping aspects of government receipts and expenditures; it was concerned primarily with the problem of how this vast sum could be spent by the government for war purposes while yet avoiding an inflation of prices and the cost of living. It was made clear that this problem had to be met by eliminating the "inflationary gap"—the excess of total private and government expenditures over the total goods and services available for purchase. This emphasis on the inflationary gap represented a conceptual innovation of great importance for it implicitly recognized that the budget deficit as such was irrelevant for the problem of war finance. What it meant in practice was that the chancellor was interested in offsetting the inflationary gap which he estimated at about £500,000,000 rather than the budget deficit of £2,420,597,000. Since closing the gap necessitated a reduction in total expenditures and since the government expenditure was necessary for the war effort, it was evident that private expenditure would have to be reduced. Otherwise inflation would be inevitable. It was proposed that half the gap be met by increased taxation and half by increased saving on the part of the public.

The new taxes were to be obtained from increased individual and business levies. Under the new rates and lowered exemptions, taxes on the highest income bracket were raised to 87½% while at the lower end of the income scale 2,000,000 new taxpayers were affected for the first time. An unmarried worker earning £110 and a married worker with two children earning £270 would in 1941 pay an income tax.

Two innovations in connection with the income tax proposals deserve special mention since they were significant indications of the trend of economic thought in democratic states. The first was that the graduation of the surtaxes on the higher incomes was so steep as to constitute an effective ceiling on personal income after taxes at about £4,000. To retain this amount required a gross income in the neighbourhood of £30,000, and there were only about 1,000 incomes of this size or over in Britain. The steepness of the graduation in the higher brackets might be judged from the fact that whereas half of a gross income of £4,000 would go for taxes, a taxpayer with a gross of £100,000 would be left with less than £6,000.

The second was the adoption of the "forced saving" plan first proposed by the famous British economist, John Maynard Keynes. It provided that the increased income taxes paid by individuals because of lowered exemptions and allowances be credited to the taxpayer and repaid to him after the war. Since there was a fairly low upper limit to the rebate, this provision primarily benefited persons at the lower end of the income scale. The plan had a twofold objective. It was designed to hold out the promise of greater economic well-being after the war for the heavy sacrifices required during the conflict. It also aimed to provide a pool of purchasing power after the war to cushion the readjustment to a peacetime economy and thus prevent severe depression.

These two measures, income ceiling and compulsory saving, undoubtedly represented the longest step ever taken by a democratic nation toward the redistribution of income by taxation.

(M. GT.)

Building and Building Industry.

The building industry, like most others in the United States, was increasingly affected during 1941 by national defense needs. Rapid expansion occurred in some places and drastic curtailment in others, especially toward the end of the year, as shortages of certain materials and of some types of labour developed.

Preliminary estimates by the bureau of labour statistics gave 615,000 non-farm family dwelling units as the number for which building permits had been issued in 1941, against 540,000 in 1940. This is an increase of 75,000 units, or nearly 14%. But 73,000 units, or close to the total increase, were financed with public funds and designated for occupancy by military and naval person-

nel or by workers directly engaged in war industries. This disposed of the frequently repeated claim that private enterprise was providing the major part of defense housing. In no year since 1928 had it built enough new dwellings even to provide for the current year's net increase in number of families and net loss through fire, demolition or conversion to other use. In 1941, it fell farther behind than in 1940.

Areas of most active residential building have been in the south Atlantic and Pacific states.

Table I.—*Permit Valuation of Building Construction in Reporting U.S. Cities With a Population of 1,000 and over, First 11 Months of 1940 and 1941, by Class of Construction*

Class of Construction	January-November, Inclusive		Percentage Change
	1941	1940	
All classes	$2,524,214,893	$2,305,104,047	+ 9.5
New residential . . .	1,372,162,266	1,183,199,779	+16.0
New nonresidential . .	809,331,826	804,118,307	+ .6
Additions, alterations and repairs	342,720,801	317,785,961	+ 7.8

Table prepared by the Division of Construction and Employment of the U.S. Bureau of Labor Statistics.

According to the Federal Housing administration forecast of mid-December, the number of new homes started during 1941 with mortgage insurance furnished by that agency, would be about 30,000 greater than the 173,062 total of 1940. This includes houses built under the much criticized Title VI, which was added to the federal housing act in March 1941 to stimulate building by private enterprise for defense workers, but did not limit it to their use, or exert any control over prices charged. Nor did it protect the transplanted worker with temporary employment from being pushed into an imprudent attempt at home ownership.

Table II.—*Number of Families Provided for in New Residential Construction in 257 Identical Cities, 1921 to 1941*

Year	Families Provided for	Year	Families Provided for	Year	Families Provided for
1921	224,545	1928	388,678	1935	55,490

*Preliminary figure.
Table prepared by the Division of Construction and Employment of the U.S. Bureau of Labor Statistics.

According to the department of commerce survey of current business, the indexes of building costs for a standard six-room frame house rose from 109·3 in Jan. 1941 to 114·9 in August, the 1935–39 average being 100. Increase for the whole calendar year might average about 12%. F. W. Dodge recorded a 13·3% rise from Oct. 1940 to Oct. 1941. Efforts of the Office of Price Administration (*q.v.*) doubtless had some effect in preventing a sharper rise, though not much could be done without congressional action. Priorities in building materials were in a confused state at the close of 1941.

The stabilization of residential building costs is closely related to the stabilization of residential rents. Up to Jan. 1, 1942, nothing effective had been done except in the District of Columbia, where a comprehensive rent control act passed by congress a month earlier went into effect Jan. 1, 1942, pegging all rents where they were on Jan. 1, 1941. With the nation at war, it was to be presumed that congress would take similar action on a national scale. The chaotic condition of rents in some defense areas, with attendant hardship to workers and others of small income, and the consequent bogging down of production by excessive labour turnover, were hardly to be tolerated when so much was at stake. (*See* also BUSINESS REVIEW: *Industrial Groups;* FEDERAL HOUSING ADMINISTRATION; HOUSING; UNITED STATES: *Housing.*)

BLANDING, FLA., built to house 70,000 soldiers, rose rapidly early in 1941; workmen fitted building sections together as fast as new lumber arrived

Great Britain.—With the transfer of men into the armed forces and the difficulties of wartime building, the government found it increasingly necessary to direct and control this vital and complex industry. It created the ministry of works and buildings under the direction of Lord Reith, with heavy responsibilities and wide powers under different regulations to secure the highest degree of efficiency and output under difficult and changing conditions. He appointed to assist him a central council composed of representatives of the many and diverse branches of the industry, selected primarily for their experience and practical knowledge. Matters coming within their competence included: (a) mobilization of resources to secure maximum output and efficiency; (b) measures to secure the maximum concentration of these resources on vital work and to restrict nonessential work; (c) priority questions and the relationship of building programs to available resources of labour and materials, and the progress of all important jobs; (d) terms and conditions of employment affecting present output and efficiency; (e) welfare arrangements, general and particular; (f) allocation of work among contractors and builders with regard to capacity, location, size and type; (g) form of contract to suit war conditions and to secure utmost incentive to efficiency and economy; (h) control and use of construction plant and of transport equipment; (i) production and distribution of materials, their design, standardization and use; (j) education and training of personnel and problems bearing on postwar reconstruction; and (k) problems of man power arising from competing demands for labour.

There were in 1941 two main organizations of employers with a membership of 8,600 firms and probably another 50,000 smaller firms outside. To assist in organizing these firms for the maximum war effort, all undertakings and branches of the building and civil engineering industries have to register.

During 1941 the building industry was engaged almost entirely upon wartime demands. It was estimated that less than 5% of the industry's available man power was employed on purely civil building, due to the restrictions imposed by the government whereby a licence was necessary for all building costing more than £500. This amount was subsequently reduced to £100.

Great and urgent building programs were put in hand on thousands of sites up and down the country, many in areas thinly populated and difficult of access. In addition intensive bombing attacks made severe demands on the industry for a large volume of repair work and replacement of industrial buildings.

In peacetime the industry numbered some 1,400,000 workers; of these it is estimated 750,000 were engaged on the main war constructional works, and the rest with local authorities and public utilities on maintenance and on air-raid damage and running repairs.

Some traditional materials were in short supply and the government building research station was investigating the design and availability of substitute materials and fitments. (N. KE.)

Bulgaria. A kingdom in the Balkans. Area (end of 1940) *c.* 40,900 sq.mi.; pop. (est. 1940) 6,700,000. Capital: Sofia. Chief cities: Sofia (327,000); Philippopolis or Plovdiv (99,883); Varna (69,944); Ruschuk or Russé (49,447); Burgas (36,230); Plevna (31,520). Religion: mainly Greek Orthodox; 821,928 Moslems; 48,398 Jews. King: Boris III; premier, Professor Bogdan Philoff (*q.v.*).

History.—During 1941 Bulgaria continued its pro-fascist regime under the king's personal dictatorship, as established by the royal coup d'état of May 19, 1934. This government aligned Bulgaria openly with the axis powers in 1941 and participated in the German invasion of Greece and Yugoslavia, occupying large parts of their territories. Though there was much popular agitation for an alignment with the soviet union, in view of the strong sympathies of the Bulgarian masses for the U.S.S.R., Premier Philoff stressed in a speech on Jan. 12 that Bulgaria should not be influenced by any sympathies but that its policy must be guided by "Bulgaria First" principles, working only for Bulgaria, and never sacrificing anything for allegedly foreign interests. This speech prepared the Bulgarian public for a "neutrality" policy which brought Bulgaria closer and closer to the axis, against the sympathies of a large part of its population. Virtually the entire Bulgarian tobacco crop was bought by Germany at the end of January for 4,000,000,000 leva. Soon it became clear that the so-called neutrality policy of the Bulgarian government favoured the entrance of German troops into Bulgaria, thus facilitating their plans of potential aggression against Yugoslavia, Greece and Turkey. The official press clamoured for Greek Thrace, including the area between the rivers Mesta and Struma and the port of Kavalla. When Prime Minister Churchill stated on Feb. 9 that Bulgarian airports were being occupied by Germans, the Bulgarian telegraphic agency issued an official categorical denial. But it soon became clear that this denial was not founded on truth. German engineers were improving the Bulgarian highways for strategic uses. As early as Feb. 14 the Bulgarian foreign office had to admit that the country had agreed to let German armies march through to the Greek border. At the same time Bulgaria and Turkey issued a joint declaration of mutual nonaggression which indicated that Turkey, despite its alliance with Britain, and contrary to previous declarations, would not resist the crossing of the Bulgarian frontiers by German troops and the occupation of the country.

"HANDS ACROSS THE BALKANS." Germany's hand of friendship is ever a mailed fist, warned Knox of the *Memphis Commercial Appeal* as Bulgaria joined the axis March 1, 1941

By the end of February, German general staff officers arrived in Bulgaria in civilian clothes, and all the preparations for an immediate occupation of the country by large numbers of German troops seemed imminent. On March 1 the Bulgarian cabinet had officially decided to sign the axis tripartite pact; accordingly, Premier Philoff and Foreign Minister Ivan Popoff flew to Vienna, where they formally signed the treaty with Germany which gave to the Germans the official right to occupy Bulgaria. On the same day the German armies crossed the Danube from Rumania, and from that moment on, the country was fully in axis hands, and shared that general blackout, as far as authentic news is concerned, which had by 1941 covered the greatest part of the European continent. The Allied diplomats left Sofia, while mighty German columns rolled through the land. All liberal and democratic elements in Bulgaria, as well as all those who were in sympathy with the U.S.S.R., went into hiding or were arrested. While the Germans took up positions on the Greek and Yugoslav borders, the Bulgarian army was mobilized along the Turkish frontier. Although, according to the Bulgarian premier, the task of the German troops in Bulgaria was "to safeguard the peace and tranquillity of the Balkans," in reality they had gained those strategic positions which allowed them in the beginning of April to deal quick and decisive blows to Yugoslavia and Greece, whose defense positions had become infinitely more difficult as a result of Bulgaria's co-operation with Germany. The command of the German troops in Bulgaria was entrusted to General Field Marshal Sigmund List and Colonel-General Nikolaus von Falkenhorst, a specialist in mountain fighting.

As soon as the German troops smashed into Yugoslavia and Greece and defeated the armies of these two countries, Bulgarian troops who had not participated in the fighting or conquest themselves began to occupy part of the Greek and Yugoslav territories conquered by the Germans, especially Thrace and Macedonia. (*See* WORLD WAR II.) To the seven provinces of Bulgaria, three new ones were added—those of Bitolj, Skoplje and Xanthi—while the former Serb districts near Pirot and Tsaribrod were incorporated into the province of Sofia. Thus Bulgaria acquired a large additional territory in which the Greek and Serb inhabitants were subjected to systematic persecution. The territory gained from Yugoslavia, at least temporarily, was estimated at 26,000 sq.km. with about 1,500,000 people, and was economically important on account of its tobacco and opium. From Greece Bulgaria temporarily gained Macedonia with about 25,600 sq.km. and *c.* 1,600,000 inhabitants and western Thrace with 8,712 sq.km. and *c.* 350,000 inhabitants, both containing important silk, tobacco and olive production and a relatively well developed industry. With this conquest achieved, parliament amnestied the former Mace-

donian revolutionaries, among them Ivan Mihailov, the head of the IMRO. The war between Germany and the soviet union again brought forth the strong sympathies for the U.S.S.R., but the government terrorized the population into submission, though popular feeling remained strong enough to prevent Bulgaria from an open participation in the war against the soviet union. Some of the Bulgarian liberals succeeded in escaping and organized abroad a free Bulgar movement under Kosta Todorov.

Education, Defense, Finance.—Though elementary education is obligatory, the census of 1934 showed 20.4% of the males and 42.8% of the females illiterate. In 1938 Bulgaria had 7,782 schools with 30,832 teachers and 1,086,849 pupils. Military service is compulsory for all men between 17 and 65; normal military service lasts two years in peacetime. The war strength of the Bulgarian army was estimated at 500,000 men in 1941. Navy and air force were negligible. The monetary unit is the leva (=1.203 cents U.S. in 1940), stabilized at 92 leva to one gram of fine gold. The revenue and expenditure for 1939 were estimated at 7,626,000,000 leva each. On June 30, 1939, the total foreign debt amounted to 12,945,000,000, the internal debt to 8,805,000,000 leva.

Trade, Communication, Agriculture, Minerals.—Imports amounted in 1939 to 5,196,000,000 leva, of which more than half came from Germany, only 119,000,000 from the United States. In the same year exports were 6,064,000,000, of which about two-thirds went to Germany and 205,000,000 to the United States. The most important articles of import were machinery and war material, metal goods, textiles and vehicles; the most important articles of export were tobacco, fruit and eggs. In 1938 Bulgaria had 2,129 mi. of state railways, 723 post offices, 749 telegraph offices and 719 telephone exchanges.

More than 80% of the population are engaged in agriculture; the main crops are wheat, corn, barley, rye, in addition to fruit, tobacco, silkworm cocoons, cotton and sugar beets. Industry is only very little developed, but has abundant coal mines at its disposal. In addition some aluminum is mined. (H. Ko.)

Burdwan, Sir Bijay Chand Mahtab, MAHARAJADHIRAJ BAHADUR OF (1881–1941), Indian statesman and nominal ruler of more than 1,000,000 persons in India, was born Oct. 19 and became head of the Kshattriya community at the age of six. In 1908 Sir Bijay saved the lieutenant governor of Bengal from assassination and was made a member of the third class, civil division of the Indian Order of Merit, for his bravery. He was a member of the imperial legislative council, 1909–12; a member of the Bengal legislative council, 1907–18; and a member of the Bengal executive council, 1918–24. In 1926, Sir Bijay headed an Indian delegation to the British Imperial conference in London. He was the author of a number of Bengali poetical works, dramas and meditations. He died in Burdwan, India, Aug. 29.

Bureau of Standards, National: *see* STANDARDS, NATIONAL BUREAU OF.

Burma. A British province lying on the eastern side of the Bay of Bengal, between India and Thailand. Area 261,610 sq.mi.; pop. (1941) 16,823,798. Chief cities: Rangoon (cap. 498,369), Mandalay (est. 150,000), Moulmein (70,000). Governor: the Rt. Hon. Sir Reginald Dorman-Smith; prime minister in 1941: the Hon. U. Saw; languages: Burmese and English; religion: Buddhist (85%).

History.—The unfurling of the new national flag by Sir Archibald Cochrane before he relinquished the governorship marked a further stage in Burma's progress as a member of the British commonwealth. Burma's defenses were strengthened prior to the outbreak of war in the far east, and her defense measures were greatly facilitated by the ministerial stability of the government. New battalions and technical units were raised, the Burma royal naval volunteer reserve was constituted, and the first unit of the Burmese navy was launched by Lady Cochrane. Pilot officers were trained for an auxiliary air squadron and new air bases were constructed. The people of Burma contributed generously for the provision and maintenance of the first Burma squadron of fighter planes, which distinguished itself in the battle of Britain. Burma's valuable oil, mineral and teak supplies were directed into useful channels, and her general preparedness for war was announced by Sir Reginald Dorman-Smith, who succeeded to the governorship on May 6, 1941.

War did in fact come to the borders of Burma when Japan opened hostilities against the United States and Britain Dec. 7, 1941, and Thailand capitulated to Japanese forces after a token resistance. After striking south into the Malay peninsula, Japanese forces penetrated westward on the narrow isthmus into Burmese territory.

The year 1941 marked the end of the free trade policy which had for many decades regulated commerce between India and Burma. A new trade agreement substituted a commercial policy of mutual preferential treatment of goods of Indian and Burmese origin. Both Burma and China derived mutual advantage from the speed-up of traffic on the Burma road and the exchange of goodwill and trade missions. The government of Burma started construction on the 110 mi. extension of the railway line from Lashio to the Yunnan frontier, which was to link up the railway systems of Burma and China.

As in the United Kingdom, Japanese assets were frozen before the start of war, and to prevent a slump in prices the Burma government purchased the entire cotton crop, of which Japan had been importing large quantities.

Broadcasting in Burmese and English from the new Rangoon station encouraged in the local population a lively interest in social, educational, economic and international affairs. The prime minister visited Britain in October.

Japan's act of unprovoked aggression against British territory led to the British declaration of war on Dec. 8; accordingly a state of war came into existence between Burma and Japan.

Education.—In 1940 total number of institutions 27,015, scholars 851,922; primary schools 5,679, scholars 384,060; middle 1,018, scholars 139,190; high 399, scholars 94,353; special 1,172, scholars 19,190; unrecognized institutions 18,745, scholars 212,663; university, Rangoon, 2,365 students; arts college, Mandalay, 101.

Finance.—Revenue (est. 1941–42) Rs. 17 crores 13 lakhs; expenditure (est. 1941–42) 18 crores 28 lakhs; public debt (March 31, 1940) Rs. 51 crores 22 lakhs; exchange rate: rupee (Rs. 1)=1s.6d., or about 30 cents, U.S. One crore=10,000,000 rupees; one lakh=100,000 rupees.

Trade and Communication.—Overseas trade in merchandise (April–March 1940–41): imports Rs. 29 crores 55 lakhs; exports, including re-exports Rs. 55 crores 38 lakhs. Communications 1940: roads suitable for motor traffic, all weather, 6,811 mi., seasonal 5,661 mi.; railways, open to traffic 2,060 mi.; inland waterways (approx.) 1,300 mi.

Agriculture.—Production (est. 1940–41): rice 6,000,000 tons (est. 1940); ground-nuts 190,000 tons; sesamum seed (est. 1940–41) 59,000 tons; cotton (1939–40) 17,000 tons of lint; tobacco (1939–40) 136,349,730 lb.

Mineral Production.—In 1939, petroleum 275,673,364 gal.; tin concentrates 5,441 tons; tungsten concentrates 4,342 tons; tin tungsten concentrates 5,593 tons; refined lead 76,000 tons; antimonial lead 1,180 tons; zinc concentrates 59,347 tons; copper matte 7,935 tons; nickel speiss 2,896 tons; silver 6,175,000 troy oz.; gold 1,206 troy oz. (Ton=2,240 lb.) (*See* also CHINESE-JAPANESE WAR.) (H. L.; X.)

Bush, Vannevar (1890–), U.S. scientist and electrical engineer, was born March 11 at Everett, Mass., and took his doctor's degree in engineering at Massachusetts Institute of Technology and Harvard in 1916. During World War I, he did research on submarine detection for the U.S. navy. He was associate professor and later professor of electrical power transmission at M.I.T., 1919–32 and was vice-president and dean of engineering at that school, 1932–38. In 1939, he was named president of the Carnegie Institution of Washington. While at M.I.T., he built a famous mathematical robot which solves differential equations; this analyzer was being used in 1941 by the U.S. army to solve gunfire problems. In June 1940, President Roosevelt named him chairman of the National Defense Research committee, a scientific research group charged with co-ordinating all experimental investigation to speed up U.S. defenses. In June 1941, President Roosevelt created the new Office of Scientific

Research and Development (*q.v.*) with Dr. Bush as its director. Dr. Bush, who had also been chairman of the National Advisory Committee for Aeronautics since 1939, resigned this post in July 1941 to devote all his energies to his new job. In Oct. 1941 he said that 75% of the nation's top physicists and 50% of the top chemists were engaged in war research and that his office was co-operating with the U.S. navy and army, and with British war experts.

Bush, Wendell T. (1866–1941), U.S. educator, was born Sept. 25 in Ridgeway, Mich. He received his Ph.D. degree from Columbia in 1905 and became a lecturer at that school in the same year. In 1928 he became full professor of philosophy and 10 years later retired as professor emeritus. He was co-founder and co-editor of the *Journal of Philosophy*. Professor Bush, an authority on the sociology of religion, donated in 1935 his collection of religious fetishes, amulets and medicine bundles to Columbia. He also turned over to the school his library of philosophy and religion. He died in New York city on Feb. 10.

Business Review. In addition to the normal civilian demands for 1941, U.S. industry confronted three distinct stages in the development of defense production. From January until May, especial efforts were made to meet the needs of aid for the Allies; from June until Dec. 7, industry increased the tempo to fulfil the domestic demands for preparedness; after Dec. 7, business settled down with a grim will to meet the needs of total war.

Industrial Production.—In the first stage, production of non-defense materials was encouraged as a means of increasing civilian supplies in order to check the growing threat of inflation. Beginning as early as April 11, however, the Office of Price Administration (*q.v.*) imposed ceilings on those rising prices that were not conducive to increasing the output of industry. By Aug. 28, with the reconstituted Supply Priorities and Allocations board (*q.v.*), the administration tried through voluntary agreements with industry to increase defense output and at the same time curtail production of dispensable and competing civilian commodities. Even so, it took the outbreak of war to centralize coordinated control over U.S. industry and focus the efforts of labour and capital on the output of defense materials.

Capital for industrial defense production was derived from two sources. The investment of private funds in industry was estimated to have been more than $1,000,000,000, and the investment of public funds by the Reconstruction Finance corporation (*q.v.*) exceeded $851,000,000.

The labour reserve upon which industry could draw approximated 8,000,000 unemployed persons at the beginning of 1941, of whom all except 2,500,000 were absorbed by industrial and military expansion by May. Reliable estimates placed the average unemployment from May to October at nearly 1,600,000, or a number approximately equal to those engaged on Work Projects administration, Civilian Conservation corps and other governmental activities. Industry, however, was on the lookout for skilled and technically trained labour, competent to produce the machines for a mechanized warfare, and a shortage of this type of labour proved a bottleneck as early as August. The predicament of management became so acute, with the threat of the draft drawing an added 2,000,000 or 3,000,000 labourers into the armed forces, that industry resorted to lengthening the work week and to training unskilled labour for skilled labour needs. The use of unskilled labour forced industrial costs to rise. Inexperience both in management and labour checked the development of the industrial expansion program, which already had been handicapped by the hesitancy of capital to flow into temporary war industries.

An accurate survey of the month-by-month movements in physical production as compiled by the Federal Reserve board is shown in Table I. With the single exception of the month of April, a constant increase occurred in the total output of U.S. mills, factories and mines. Total production began the year at 140 and closed at 168, with 70% of the increase taking place during the first half of the year. The production of durable manufactured goods led the upward march of industry in a steady and uninterrupted monthly increase. If the United States had operated throughout the entire year at the same capacity as in the final quarter, the national income would have approximated $99,000,000,000. Industrial production was more than double that of the war period of 1918. Nevertheless, from the point of view of the armed forces, the weakness on the economic sector consisted in "partial support of total war"; most pronounced was the abrupt drop in the bituminous coal output caused by strikes during April, when one of the war's essential products hit the lowest level. Physical production of movable goods is most clearly observed in the month-by-month freight car loadings, and nonmovable production in the construction contracts.

Table I.—*U.S. Industrial Production Indexes, 1941*

Month	Industrial production Physical volume 1935–39=100				Freight car loadings	Construction contracts 1923–25=100		Bituminous coal	Crude petroleum

*Estimated.

Business and the National Defense Program.—The U.S. defense program was seriously inaugurated in May 1940, when the Federal Reserve index of industrial production stood at 116, based on the 1935–39 average. The accelerating momentum of defense production both directly and indirectly forced this index upward until by Dec. 1941 it had gained 52 points. Despite this increase, however, the year 1941 marked the transition from a decade of plenty to an era of scarcity, a transition caused by the demands of preparedness and war.

War materials and munitions assumed first rank in industry, drawing labour and capital from other industries, and causing a general conversion from a peacetime to a wartime basis for many mills and factories. One of the results of this transfer of output was a further transfer in control from business to the national government. Industries began to confront price control, rationing, allotments, higher taxes, licensing, commandeering and war-profit limitations.

Industrial Conversions.—Converting peacetime plants and factories into war mills proved to be one of the most challenging problems ever to confront U.S. management. A typical case which serves to explain the nature of the conversion problem was that of General Motors corporation, whose production was converted into such an extensive war program that the cumulative value of the contracts and annual deliveries of war supplies as of Dec. 31, 1941, were as follows: for aircraft and parts, $827,000,000; for tanks, $69,000,000; for guns, mounts, controls, machine guns and rifles, $271,000,000; for ammunition, $78,000,000; for trucks,

$137,000,000; for electrical equipment, $7,000,000; and for other defense products, $13,000,000, or a total of $1,619,000,000. Of this overwhelming amount the company had deliveries to its credit of about $400,000,000 at the close of 1941. Likewise, the Ford Motor company closed the year holding more than $1,000,000,000 in orders for bombers, aircraft engines, trucks, fire control apparatus and tanks. Although the dollar value of defense contracts at the Chrysler plants was not released, it was estimated that about 70% of the productive capacity of 13 plants was converted into munition manufacture during the year, and the balance was assigned to the production of ordnance, tanks and bombers.

The fundamental economic principle of division of labour for war purposes began to manifest itself in the defense contract awards during 1941. Thus, the biggest bomber plant was assigned to the Ford Motor company; the biggest tank factory to Chrysler; Merlin engines for the British, to Packard Motor company; the Pratt-Whitneys to the Buick, Chevrolet, Studebaker and Ford companies; while other defense contracts were allotted to the Hudson and Pontiac plants. Bethlehem Steel held $1,300,000,000 in contracts whose concealment became a part of the war strategy. This conversion of the automotive industry into a war industry during the short space of one year was typical of the innumerable other plants ranging in size from giant mills to humble garages.

The Time Problem.—The change from a peacetime to a wartime basis was a race against time by industrial management and labour. When France collapsed during the summer of 1940, the value of the output of the U.S. defense industries amounted to about $150,000,000 per month. Intensive and extensive plant expansion, coupled with the co-ordination of allied and interdependent industries and the utilization of small plants as well as highly skilled engineering talent, resulted in bringing the output of the defense industry to a total value of more than $1,850,000,000 for the year 1941. It was this historical achievement of 18 months that became the basis for the forecast of a monthly defense production by July 1942 of $4,600,000,000; *i.e.*, the anticipated two and a half-fold increase was founded upon the tenfold increase that had taken place in one and one-half years.

The Wages and Hours Problem.—The U.S. department of labour revealed that on Nov. 1 the average hours worked per week in the key defense industries had risen well above the popularly approved 40-hr. week. Labour was working 51·8 hr. per week in the machine tool industry; 50·4 in firearm manufacture; 46·9 in engine and machine making; 45·4 in shipbuilding; 45·2 in aircraft; 44·2 in munition making; 43·8 in electrical machinery; 43·0 in brass, bronze and copper; 42·4 in aluminum. The Pearl Harbor incident extended this average work week. With longer hours came higher pay per hour for labour. The department of labour reported increases in pay rolls and overtime premiums and average hourly earnings for factory workers on Dec. 1 of 77 cents per hour, the highest in 12 years. (*See* also LABOUR UNIONS; WAGES AND HOURS.)

The Priorities and Rationing Problem.—In earlier wars no priority problem was recognized because the concept of total war had not developed. The Office of Production Management at first, and later the Supply Priorities and Allocations board (and, in Jan. 1942, the War Production board) were set up to assure adequate supplies of materials for the successful prosecution of the war. Their orders intercepted the normal flow of raw materials to industry. The rationing system in automobile production laid off directly and indirectly 450,000 auto workers, plus 44,000 dealers and their 400,000 employees and salesmen. So acute did priorities unemployment become that relief appropriations of $300,000,000 became necessary. Repercussions of auto curtailment moved in many unforeseen directions, as, for example, the unexpected drop in high-grade municipal bonds secured by highway, bridge and tunnel tolls that sent some issues to record lows, and caused pleasure resorts to reef their sails for tourist trade. These unforeseen ramifications of priority orders disrupted industrial plans and led to widespread protestations by nondefense industries, which insisted that priorities should not demoralize but rather maintain the civilian economy. (*See* also PRIORITIES; PRODUCTION MANAGEMENT, OFFICE OF.)

The Small Business Problem.—Closely allied to the priorities problem confronting nondefense industries were the "small business" problems created by rationing, allotments of raw materials and concentration of governmental defense contracts. The Office of Production Management had called in army and navy officers who were familiar with military needs and were accustomed to deal with large and responsible firms. The tremendous increase in war orders by large industries had the effect of buying in advance unusually large inventories for army, navy and air defense needs, some of which could not be used for some time in the future because of the physical limits to plant capacity. It was this concentration of orders and setting aside of unused inventories that caused 150,000 small business men to protest in late summer and early autumn against the shortsighted industrial mobilization that caused the priorities unemployment of more than 4,000,000 on their pay rolls.

The Reconstruction Finance corporation undertook to make loans in participation with banks that would facilitate the readjustment of the productive processes of small businesses to meet wartime need. In recognition of this problem, the department of commerce set up a Small Business Unit designed to aid such proprietors. Special efforts were made late in 1941 to induce large firms holding great defense orders to subcontract part of their orders to small businesses. (*See* also DEFENSE, NATIONAL [U.S.].)

Industrial Groups.—*Iron and Steel.* Open-hearth, Bessemer and electric furnaces produced an estimated 82,927,557 tons of steel ingots and castings during 1941, nearly 25% more than during the previous peak attained in 1940, surpassing by 30% the output of 1929, and comparing favourably with the peak of 50,467,880 tons of 1917 in World War I. During 1941, the plants in the iron and steel industry operated on the average at 97·4% of capacity, compared with 82·1% in 1940 and 90·8% in 1917.

The proportion of the total output of steel designed for war purposes was relatively much less than the peacetime demands of the automotive and construction industries. The 1941 demand for heavy steel needed by motorized troops required a great increase in new ingot capacity. Because the industry was unwilling again to face a postwar era with a great burden of unused capacity, the national government undertook to finance 61% of the new pig iron capacity demanded for war.

Although strikes were fewer in 1941 than in the previous year, added numbers of unskilled workers tended to lower average efficiency, and the industry also suffered acutely from a lack of scrap. The importance of maximum production for war purposes caused the government to assist in removing the obstacles, but growing restriction and control reduced by one-third after May new orders for iron and steel. The year closed with backlogs of 5,000,000,000 tons, which exceeded four months of output at capacity. (*See* also IRON AND STEEL.)

Railroads.—Car loadings for 1941 totalled 42,300,000, 16% more than in 1940. Not only was a greater tonnage per train-load recorded, but freight was operated at faster speeds, locomotives were used more hours per day, switching hours were lengthened, car repairs were accelerated and surplus cars on sidings fell to a record low level. Total car loadings by commodities indicated that 2,600,000 cars had been needed for ore, an increase of 24·8% above the requirement for 1940. Coke required 23·5% more cars than in 1940; lumber and forest products, 21·4%; coal, 11·3%;

grain products, 10·2%; merchandise, 4·7%; miscellaneous requirements, 24·4%; but livestock needs were 5·1% less than for 1940. Freight traffic reached its lowest point in April 1941 and its peak in August. (*See* also RAILROADS.)

Automobile Transportation.—More than 90% of the U.S. passenger traffic in 1941 was carried by approximately 26,000,000 privately owned automobiles of the United States. Before automobile tire allotments and before the conversion of the auto industry into a part of the "arsenal of democracy," the U.S. public had begun spring advance buying of passenger automobiles. Using the years 1935–39 as a base of 100, increasing sales for the first five months of 1941 were as follows: January 143, February 178, March 215, April 235 and May 246—more than 100 above the opening of the year. The ebb tide set in with June at 214, July 169, August 91, September at 57, a new low, and the closing months ended in the practical disappearance of sales of new cars. (*See* also MOTOR VEHICLES.)

Bus Transportation.—There were about 4,794,965,000 revenue bus passengers carried in 1941, of whom more than 3,000,000,000 were city passengers and nearly 434,000,000 were intercity passengers. The 3,560 operating companies were paid for almost 2,189,000,000 bus-miles a total operating revenue of $529,000,000, three-fifths of which was obtained from intercity traffic and two-fifths from city and suburban traffic.

The average bus during 1941 carried 83,000 passengers, operated more than 37,900 mi., and constituted a part of a larger fleet that travelled 361,000 mi. and gave employment to 2·3 men per day at an average of $3,600 in annual wages. Manufacturers produced 7,961 buses during the year, and bus traffic on the whole increased about 11%. (*See* also MOTOR TRANSPORTATION.)

Air Transportation.—Air traffic rose from 3,100,000 passengers in 1940 to 4,500,000 in 1941, and mileage increased from 120,000,000 to 150,000,000—a distance equal to a round trip to the planet Mercury. Air express traffic grew from 14,100,000 lb. to 22,500,000 lb., while air mail climbed from 38,800,000 lb. to 45,500,000 lb. during the year. For the first time the roster of civilian pilots passed the 100,000 mark, an increase of 60% over 1940.

Gross revenues for all carriers subject to the interstate commerce commission aggregated $6,699,000,000, a 9·7% increase for 1941. The greatest percentage gain in revenue was made by the motor carriers of property, although trucks and vans hauled only 8% of the total intercity traffic in contrast with pipe lines, which carried 11%; inland waterways 19%; and railways 61%. (*See* also AVIATION, CIVIL.)

Building.—In 1940 total construction contracts amounted to approximately $4,003,000,000 and rose in 1941 to about $6,007,000,000, the highest since 1928. The most spectacular part of this increase occurred in new manufacturing plant capacity ($1,181,000,000) which was two and one-half times greater in 1941 than in 1940. Nonresidential building was 79% higher and reached $2,315,000,000. Residential contracts reached a total of $1,953,000,000, the largest since 1928. The department of labour reported that 615,000 new family dwelling units had been placed under construction in nonfarm areas during the year. Of these, about 515,000 were designed for single-family use, 33,000 for the use of two families and 67,000 for multifamily purposes. Approximately 16% were financed by the Federal Housing administration (*q.v.*), and about 73,000 of the 96,000 dwellings were built for occupancy for families connected with national defense efforts.

Heavy engineering contracts, chiefly for public works and for public utility construction, amounted to $1,738,000,000 in 1941, compared with $1,112,000,000 in 1940. The urban construction index declined for the first half of the year and slowly revived until December. Throughout the last half of the year priority rulings made the procurement of building hardware, nails, dimension lumber, heating and plumbing supplies very uncertain. (*See* also BUILDING AND BUILDING INDUSTRY; HOUSING.)

Petroleum.—Mechanized warfare placed a strain on both the distribution and production facilities of the U.S. oil industry. Tanker losses caused by submarine attacks rose rapidly, and the placement of coastwise tankers in transatlantic use caused an oil shortage on the east coast. Aviation demands for high-test octane gasoline and, in turn, high-grade crude oil, necessitated great changes in oil refining and in the relaxation of state laws restraining drillings. (*See* also PETROLEUM.)

Machine Tools.—The bottleneck of U.S. defense production in 1941 was the machine tool industry, an essential for metal working. Since the industry had keenly felt the effects of a decade-long depression, it was unprepared for the abrupt impact of war demands. Nevertheless, the production in 1941 exceeded $800,000,000, compared with $450,000,000 in 1940. About one-fourth of this output was exported to Great Britain, and 1941 closed with keen competition between domestic and export trade for the tools of mechanized warfare. (*See* also MACHINERY AND MACHINE TOOLS.)

Rubber.—About 800,000 tons of crude rubber, 250,000 tons of reclaimed rubber and 15,000 tons of synthetic rubber were used in the U.S. in 1941. Almost 97% of the crude rubber supplies came from areas in which hostilities began in December, but the advance buying of supplies by the Rubber Reserve corporation as early as 1939 tended to relieve, at least temporarily, the full effects of the war. About midyear the Office of Production Management limited the demand for rubber by producers of shoes, floor coverings, rubberized clothing, rubber bands and erasers, balloons, medical sundries and drugs, and at the close of 1941 it checked the sale of autos, tires and tubes. Huge governmental loans were made to leading rubber manufacturers to stimulate production of synthetic rubber on a commercial scale. (*See* also RUBBER AND RUBBER MANUFACTURE.)

Copper.—Mine production of recoverable copper aggregated 957,394 short tons, a total exceeded only by the war peak of 1916 and the boom year of 1929. The mine output was valued at $224,000,000, an increase of 13% over that of 1940. At the same time that copper prices remained relatively fixed, at about 12 cents per pound, the output continued to rise. Imports from South America and Mexico were greatly enlarged, and exports were the smallest since 1901. (*See* also COPPER.)

Company Earnings.—The quarterly reports of corporation profits compiled by the Federal Reserve Bank of New York for 167 industrial companies showed a total income of $288,700,000 for Dec. 1940, which dropped to $280,800,000 in March 1941, $270,300,000 in June and continued a downward trend through September. Standard and Poor's corporation index of industrial earnings for 119 companies indicated that earnings moved from 114·1 in Dec. 1940 to 113·0 in March, 111·8 in June and 109·5 in September. Taking into consideration the general trend in physical production, it became evident that the United States had obtained a larger output at smaller profits in 1941.

In contrast with the general profit trend, the net earnings of 13 chemical companies showed a definite improvement throughout the year, rising from $31,100,000 in Dec. 1940 to $34,500,000 in March and to $35,100,000 in June. A similar ascent appeared in telephone profits. Likewise, 13 petroleum companies reported an increase from $9,200,000 in December to $15,900,000 in June. Class I railways, according to the reports of the interstate commerce commission, had quarterly profits in Dec. 1940 reaching $124,500,000, followed by a downward plunge to $69,900,000 in March. A reversal of trend then began, and net earnings rose to $103,200,000 by June and continued to skyrocket until September quarterly reports showed these railway profits at $188,400,000.

These "spotty trends" were typical of corporate earnings taken as a whole in 1941.

From the yields of the Dow-Jones averages, it appeared that for the 30 industrials the earnings swung upward till May, subsided until August, then revived until the close of 1941. This same broken trend was shown for 20 rails, except that the high for the first half appeared in June, and the experience was repeated for the yield of 15 utilities whose high appeared in May. But for industrials, rails and utilities the maximum yields appeared in December, which fact was all the more remarkable when viewed in the light of growing price regulation, priorities, allotments of raw materials, higher corporate income and excess profits taxes, higher wages and operating costs, the uncertainties of future markets created by advance buying, and war operations.

Congress and the administration made definite efforts to keep profits down: first, to lessen labour unrest and thereby check demands for wage increases; second, to take the profit motive, or "blood-money," out of war; third, to protect taxpayers from paying abnormally high prices for war materials; fourth, to keep prices down for those goods that entered into the cost of living in order to retain the gains that the administration had achieved for labour through the social security program of previous years; fifth, because of the acceptance of the economic theory that production could be carried on without the incentive of profits; and sixth, to prevent the use of profits in competitive buying of scarce supplies with the government. These profit policies were used to justify wage increases and price controls. It became notoriously true that corporations with huge defense contracts were not making profits in 1941 on any substantial scale; for instance, the Chrysler corporation on its first $32,000,000 deliveries of defense products reported a profit of 1/25 of 1%.

Wholesale and Retail Trade.—Total retail sales for 1941 reached the extraordinary figure of $54,000,000,000, over $10,000,000,000 more than in 1940 and $6,000,000,000 above the total for 1929. Because voluntary co-operation of industry with the Office of Price Administration worked smoothly until autumn, and partly because of the retail price lag, those prices increased only about 8%, so that the actual exchange of real income of the U.S. showed an optimistic picture. In the latter half of 1941, when greater attention was given to priorities, rationing and allotments, with the drop in output of the nondefense industries, the rise in retail sales was more an indication of the fear of inflation than of rising standards of living. Although priorities appeared in aluminum and machine tools as early as February, no significant inroad on retail sales appeared until after the middle of the year. By the end of the year, retail sales definitely felt the effect of advance buying. Forcing out of the market the civilian demand for products using copper, brass, nickel, tungsten, magnesium, tin and steel had a depressing effect on the sale of household equipment, electrical supplies, aluminum and tinwares, kitchen utensils and hardware.

Buyers' runs began in sugar, women's hosiery and paper as early as August, despite the warnings that no unusual shortages justified such buying psychology.

Retail prices exhibited the smallest advance in December for any single month of 1941, but they had an annual movement upward of 15.3%, or 21.8% above the level of the period immediately preceding the outbreak of World War II in 1939. Despite these increases, retail prices closed the year below replacement costs. Piece goods had the largest percentage of increase, rising from 87.0 in Jan. 1941 to 105.9 at the end of the year. The most striking advance was that of cotton wash goods, which advanced from 103.4 to 132.0. Women's apparel ranked next, rising from 92.5 to 107.7; men's apparel advanced from 87.0 to 105.1; home furnishings from 95.7 to 110.2; furniture from 103.2 to 126.6; musical instruments from 53.7 to 65.7; luggage from 76.0 to 98.7; and china from 94.9 to 106.4. These variations were caused both by the falling value of the dollar and by the difference in demand and supply factors in each commodity market. Those industries competing with war industries for raw materials, and those selling directly to armed forces demonstrated the greatest differential price gains.

The volume of retail sales of department stores in 1941 showed a 17% increase over that for 1940; apparel stores, 14%; and food stores, 10% for the year. Sporting goods sales showed a 25% rise, while motor vehicle dealers confronted a 25% drop for November below that of the same month for 1940. The best sustained markets were found in the lumber, building-hardwares and heating equipment stores, where an increase of 20% over the volume of 1940 was maintained with remarkable steadiness throughout 1941.

The bureau of the census reported geographically the retail sales of independent stores for the first 11 months, and on this basis the sales in the state of Washington were ahead of 1940 by 26%; Connecticut, 24%; Ohio and Alabama, 23%; Arkansas, 21%. At the other extreme were Montana, whose retail sales had advanced only 7%; Florida, 8%; Idaho, 9%; and Nebraska, Nevada and New Jersey, 10% each. In general, the inventories in the eastern sections of the United States were somewhat below the national average, and the inventories in the western section were somewhat above.

While retail sales were increasing, the department stores were building up their inventories. During October the inventories on hand were three and one-half times the volume of sales for that month, taking the average for the country as a whole, compared with a ratio of two and three-quarters for Oct. 1940. Forward buying by consumers, department store buyers and the government was common practice. (*See* also CONSUMER CREDIT.)

Wholesale Trade.—Wholesale trade presented a more optimistic picture than did retail trade in 1941, according to the bureau of the census. For the first 11 months of 1941, wholesalers reported a gain of 31% in the volume of trade over that of 1940. The differential changes in retail trade were reflected in wholesale markets. The wholesale metal sales for 11 months for 1941 were 68% above those of 1940; industrial hardware, 67%; electrical goods, 64%; plumbing and heating supplies, 49%; and industrial chemicals, 46%. At the other end of the market, the wholesale trade in tobacco rose only 7%; dairy product sales were 11% higher; confectionery, 16%; drugs, 16%; and full-line grocery sales, 15%.

In general, wholesale collections were 27% better in 1941 than in 1940.

The pessimistic side of the wholesale picture appeared in October, when the rate of increase began to slow down; November sales were 14% below those of October—a greater seasonal drop than usual, but encouragement was found in the maintenance of November gains of 24% over those of the same month of 1940. With the outbreak of war in December, the month in which retail prices showed the smallest advance, wholesale prices, led by agricultural and chemical products, rose sharply.

Wholesale inventories were built up after June. Based upon a survey of 2,870 reporting firms, the stock on hand at the end of 1941 was about one-third higher than that for 1940. Inventories of manufacturers, wholesalers and retailers were estimated at $27,000,000,000 for December, or about $5,500,000,000 above those for the same month in 1940. Of this increase, manufacturers held $3,500,000,000, retailers approximately $1,125,000,000 and wholesalers about $750,000,000.

About one-third of this increase was caused by the price advance for the year, and the rest by net additions to supplies on

hand.

Chain Store and Mail-Order Sales.—Dollar sales of chain stores were maintained at an unusually high level throughout 1941. The largest relative gain occurred in men's wear chains, followed by grocery chains, the expansion for both exceeding by 25% the sales for 1940. Shoe store chain sales rose 18%, variety chain sales about 15%, while the smallest gains were made by the drug chains —about 9%. The department of commerce also estimated that the sales of general merchandise in small towns and rural areas in the autumn of 1941 were about one-third higher than for the last quarter of 1940.

The combined sales total for Montgomery Ward and company and Sears, Roebuck and company in 1941 was 26.5% ahead of 1940, while the Western Auto Supply company gained 31.3%. Early in the year there was a swollen demand for such lines as refrigerators, radios and tires, probably in anticipation of priorities. Reliable data of the 27 chains and mail-order houses recorded increased sales throughout the U.S. of about 20.6% for the year—a volume of $4,287,000,000, of which the two leading mail-order houses sold $1,622,000,000 and the 25 chains $2,665,000,000.

Commodity Prices.—The year 1941 opened with a growing fear of inflation. To combat this fear, the government moved in two directions: first, to control the general level of prices, and second, to control specific prices. Control over the general price level was effected, first, by the recapture of funds spent by the government for defense and distributed by increased employment, partly by means of taxation and partly by the sale of bonds; second, by increasing the reserve ratio of banks and thus checking their lending capacity.

Abnormal price increases causing fear of inflation could be found in certain instances. For example, the advance between Aug. 1939 and Aug. 1941 in the price of butter was 50%; lard, 79%; food fats, 100%; soap fats, 81%; drying oils, 30%; cotton-seed oil, 108%; overalls, 24%; and sheets, 25%. To control this trend, congress gave the price administrator legal power to enforce reasonable decisions as to price ceilings for specific commodities.

In the economic order a price increase is normally an invitation to increase the supply, but in war times it may become impossible to increase supplies, especially if the producer has the advantage of a monopoly, or whenever all known natural resources are being used to capacity, or finally when competition sets in between the government and civilian uses for limited supplies. Under such circumstances price does not perform its usual economic function in a capitalistic democracy, and governmental control over specific commodity prices becomes essential.

The weekly wholesale commodity price index in Table II, compiled by the National Fertilizer association, gave a clear understanding of the extent to which specific prices had increased during 1941.

Table II.—*Wholesale Commodity Price Changes in 1941*

(1935–39 = 100)

Group	Jan. 1942	Jan. 1941	Group	Jan. 1942	Jan. 1941
Foods	118.7	92.5	Textiles	147.7	112.9
Fats and oils	129.5	73.8	Metals	104.0	103.2
Cottonseed oil	156.4	74.7	Building materials	131.7	117.8
Farm products	129.1	96.3	Chemicals, drugs	120.1	103.0
Cotton	174.0	96.3	Fertilizer materials	117.0	106.0
Grains	119.1	87.6	Fertilizers	112.7	104.0
Livestock	122.5	97.8	Farm machinery	103.4	99.7
Fuels	113.0	101.5	All groups combined	121.5	101.1
Miscellaneous commodities	126.9	110.4			

In contrast with business and industry, agriculture had not benefited to an equal extent during 1940 from the preparedness program of that year, but with lend-lease spending, prices of farm products began to rise in 1941. Despite efforts on the part of the Office of Price Administration to bring farm prices under control, congressional resistance postponed such action until the end of 1941, and agricultural prices rose until it was estimated that the annual agricultural income for the year had reached a total of $11,200,000,000. (*See* also AGRICULTURE.)

Cost of Living.—The cost-of-living index issued by the National Industrial Conference board exhibited an uninterrupted increase from 86 in Jan. 1941 to 92.9 in November (on the basis of 1923 = 100). The average index of living costs stood at 84.5 for 1939, rose slightly to 85.3 for 1940, and approximated 89.4 in 1941. When these costs were broken down into the common elements of food, clothing and shelter, then a clearer picture showed that in Jan. 1941 the food index stood at 78.7 and by Nov. 1941 had risen to 92.2. Meanwhile, clothing began the year at 73.5 and rose to 79.6 by November, whereas housing opened the year at 87.6 and closed the month of November at 89.5. If fuel and light costs are added, the year 1941 showed that the U.S. citizen, on the average, paid 86.4 in Jan. 1941 for what he paid 90.2 in November, while that mysterious item in the cost of living known as "sundries," required 93.1 in January and demanded 101.9 for the same supply in November.

Federal steps to impose price ceilings were accelerated by the outbreak of the war, and attempts were immediately made to apply ceilings to a much wider variety of commodities. Maximum prices were reluctantly extended to later stages of production and in many instances covered retail prices of consumers' goods. A large number of price ceilings established earlier in 1941 were advanced, and premium price plans for extra production based upon quotas by the Price Administration were instituted to perform the normal function of price in stimulating production. (*See* also COST OF LIVING; PRICES.)

Securities and Banking.—New capital issues for 1941 exceeded the $1,000,000,000 mark, the highest level since 1937. Railroads, public utilities and telephone companies were securing funds for new equipment. Manufacturing companies sought capital through the sale of stock; the federal government needed funds for defense, while state and municipal governments continued their four-year-old policy of decreasing new issues and refunding old.

The price of high-grade bonds increased about two points between Jan. and Dec. 1941 and the price of stocks fell about eight points. During the first quarter of the year, stock prices held firm with news of increasing physical output, increased car loadings and rising wages, but dull spots were caused by strikes, British defeats and the dismal reports on the battle of the Atlantic. In March the spotlight turned from the stock to the commodity markets, where the full effect of the lend-lease funds began to be felt, and the stock market reflected that optimism. In April stock prices receded because of the threats of price and production control and the black news from southeastern Europe, which also exerted a prolonged influence through May. By June the declaration of an unlimited emergency by the president led to a belief that strikes would end, defense production would be speeded up, and industry protected; hence stock prices revived. July saw an optimism based on the startling strength of Russian armies, but August brought disappointing news on the "shoot first" order, and the vague peace appeals of the Atlantic charter. In the last quarter of 1941, the greatest tax-selling wave in ten years, growing alarm over corporate taxes, price controls without wage controls, and the anticipation of a prolonged war sent stock prices to the low for the year. (*See* also STOCKS AND BONDS.)

Banking.—In 1941 the volume of commercial paper outstanding reached the highest point in five years. Discount rates remained at the 1½% level, however, and the amount of money in circulation increased nearly 22% during the year—the highest on record and twice as high as for the prosperous era of the '20s. Instalment loans were curtailed during the summer, but throughout the year agricultural loans continued to remain the stable element in the banks co-operating with the Farm Credit administration. The credit inflation danger was lessened by the doubling of the reserve ratios within the maximum limits fixed by the Banking act of 1935, by the distribution of the New York reserves throughout the system, and by the heavy purchase of treasury paper. At the time of the attack on Pearl Harbor, the reserve banks were in a favourable position to carry on the financing needs of the government, and although the market needed no support at that time, the banks were in a position to aid government bonds in the same manner in which they supported the bond market when the war started in the fall of 1939. In general, bank earnings showed considerable improvement in 1941, for country banks as well as for reserve city banks. (*See* also BANKING; FEDERAL RESERVE SYSTEM.)

Bankruptcy.—According to Dun's *Statistical Review*, Jan. 1941 opened with a total of 1,124 industrial and commercial failures. In the ensuing six months, the total dropped until 970 business failures were reported for June. October registered a total of 735 bankruptcies, the lowest monthly total for the year. The trend in business failures during 1941 was distinctly favourable; the total approximated 11,771 compared with 13,619 for 1940, and 14,768 for 1939. Dun's insolvency index, adjusted for seasonal variations, showed a steady drop from 62.0 for Jan. 1941 to 55 for June, with a slight increase for the summer months and an uninterrupted drop to November of 46.1—the lowest point in five years.

THE VAGARIES of production and consumption are pictured in this cartoon of 1941 captioned "The Storm," by Herblock of NEA Service

Of all the businesses and industries that failed during 1941, 61.1% had liabilities of less than $5,000. At the other extreme, only seven failures in the United States had liabilities in excess of $1,000,000. In January, 92.1% of all failures had liabilities of less than $25,000, and 97.8% of the total number of failures had liabilities of less than $100,000. Taking the month of January as typical, since monthly distribution of trade failures presented no wide variations, 68% of all failures occurred in retail trade; 14% in mining and manufacturing; 8.5% in wholesale trade; 4.8% in the construction industry; and 3.8% in commercial service.

Legislation Affecting Business.—Treasury experts estimated that the corporate income tax of the Revenue act of 1941 would net an added $2,000,000,000. The 10% additional defense tax of 1940 was absorbed in the regular normal rate, and a corporate surtax of 6% was imposed on net incomes up to $25,000, and a tax of $1,500 plus 7% on net incomes in excess of $25,000. In addition, the law required corporations to pay an added 10% on each excess-profits bracket, beginning at 35% on adjusted excess profits not over $20,000, rising to 45% if over $50,000, 50% if over $100,000, 55% if over $250,000, and 60% if over $500,000. The law allowed a credit amounting to 125% of new capital invested, with certain limitations. Congress increased the capital stock rate from $1.10 to $1.25 for each $1,000 of adjusted declared value of capital stock. The defense excise tax rates which were originally intended to expire July 1, 1945, were made permanent by congress. Many rates were substantially increased, and new manufacturers' excise taxes of 10% were added on sporting goods, luggage, photographic supplies, electric signs, business and store machines, rubber goods, optical equipment, electrical appliances and many other industrial products. The increased estate and gift taxes had little direct effect on business. (*See* also TAXATION.)

In addition to increased national taxation, the several state legislatures revised revenue sources in 1941. Maryland added taxes on gross receipts, admissions and amusements. Seven states raised liquor taxes. Florida increased billboard and chain store taxes. Ohio added a new corporation licence tax. Eight states enacted use fuel taxes, eight others extended emergency gas tax rates, while four added permanently to their gas tax. State, individual and corporate income taxes were raised in Maryland, Massachusetts, Minnesota, North Dakota, West Virginia, Wisconsin and Pennsylvania. New York extended the temporary increase of 6% on corporate net incomes to 1942, but dropped the 1% emergency tax on personal incomes. Three states amended their tax laws to reach federal salaries. South Dakota substantially reduced the burden of the income tax; Iowa removed the chain store tax on units in villages; Texas exempted bona fide filling stations from the chain store tax.

New Jersey revised the railroad tax laws by imposing a flat rate of 3% on all property used for railroad purposes. Indiana reduced the rate of the gross income tax from 1% to ½%; Illinois raised severance taxes by imposing a tax of 3% on the value of oil produced; and Minnesota raised the occupation tax on iron ore. Cigarette taxes were increased in Oregon, Oklahoma and Illinois. Temporary utility taxes were extended in Ohio, New York, Pennsylvania, Illinois and Massachusetts.

Action taken in 1941 by administrative agencies exerted a detrimental effect on business equal to federal and state legislation. Thus, export-licence controls led the way on Jan. 10 for copper, brass, zinc, bronze, nickel and potash. Mandatory priorities by the Office of Production Management in February affected aluminum and machine tools. Executive orders for price control in April extended voluntary agreements for price ceilings until more than 100 commodities were affected by midsummer. Wages and hours orders of the National Labor Relations board (*q.v.*), the Mediation board and the Conciliation service adversely affected the business outlook. (*See* also LAW.)

U.S. Foreign Trade.—Dominating U.S. foreign trade in 1941 were the materials and policies of war. Normal foreign trade was influenced by the lend-lease policy, aid to the Allies, hemispheric unity, priorities control, the freezing of foreign funds, British blockade of continental markets, and the congressional addition of $500,000,000 to the capital of the Export-Import Bank of Washington (*q.v.*). After the outbreak of war with Japan, the government no longer disclosed the product, source or destination of shipments; hence reliable information was largely confined to the first half-year.

The total value of foreign trade, exports and imports combined, from January till June amounted to $3,597,000,000, 8% more than for the corresponding period of 1940, and exceeding by 30% the five-year average value of the 1936–40 period.

The drop in the rank of agricultural products was the most startling single fact of the half-year. Never before in U.S. history had agricultural products constituted but 9% of the total value of exports. Aircraft assumed first place in export trade with 13.9%, a gain of 105.1% over 1940. Following in the order of value of exports were automobiles, power-driven machinery, electrical machinery, steel ingots, iron and steel plate, agricultural machinery, coal and coke, lubricating oils and ammunition.

Table III.—U.S. Monthly Export-Import Trade, 1941 and 1940
(in millions)

Month	1941		1940		Gold imports movement	
	Exports	Imports	Exports	Imports	1940	1941
Jan.	$325.4	$288.6	$ 370.1	$242.0	$236.4	$134.2
Feb.	303.4	233.7	347.0	199.8	201.5	108.6

*Average.

Tropical foodstuffs and defense materials led the import trade for the first half-year. Rubber imports by June were 36% above the 1940 level and 85% above the five-year normal average of 1936–40. Crude rubber alone constituted 12.6% of the total value of imports, followed in turn by unmanufactured wool (7.5%), coffee (6.9%), cane sugar (5.9%) and tin (5.3%). Countries supplying the goods of greatest value were Canada ($236,000,000), British Malaya ($168,000,000), Netherlands Indies ($95,000,000), Cuba ($86,000,000), Brazil ($83,000,000), Argentina ($76,000,000), United Kingdom ($68,000,000) and Japan ($65,000,000).

The percentage increase in both export and import trade made the year 1941 unique. Compared with the first half-year of 1940, lead imports rose 4,891%; refined copper, 2,822%; unrefined copper, 1,029%; and tin, 539%. In the export trade, combustion engines rose 454%, condensed milk, 339%, firearms, 203%, pig iron, 228% and ammunition, 167%. Table III affords a reliable month-by-month trend and comparison of U.S. export and import trade for 1940 and 1941. (*See* also INTERNATIONAL TRADE.)

Business Conditions in Other Countries.—*Great Britain.* The war dominated the business situation throughout 1941. From the outbreak of war in Sept. 1939 to Sept. 1941, the British board of trade wholesale index rose about 57%, while the ministry of labour's cost of living index advanced 28%. The extension of governmental control over money, credit, production, consumption and the distribution of goods and incomes became a paramount business consideration.

The limitation of supplies orders in 1941 regulated retail sales by diverting production to war and to export trade, the means by which essential imported war materials were partly paid. Operating similarly to priorities in the United States, these orders were first used in June 1940 to restrict the sales by wholesalers and manufacturers to 66% of the value of normal trade in specified goods, for the period from June 6 to Nov. 30, 1940. These orders included clothing, toys, musical instruments, office appliances, cosmetics, toilet preparations, carpeting, pottery, luggage, cameras, jewellery, household appliances and supplies.

This list was increased by a renewal order on Dec. 1, 1940, that reduced quotas for many products from 66% to 50%, but were as low as 25% for metal products. Since these quotas were stated in terms of price, the effect of the price increases was a more than proportionate decrease in the volume of physical production. Not until the last quarter of 1941 was the full impact of these orders realized, because wholesalers and manufacturers had relied upon the "inventory cushion." But as these stocks vanished, the quotas became an arbitrary limit on replacements, and business generally began to experience the pinch of limitations. Nevertheless, the very existence of the "inventory cushion" tended to prevent a more abrupt increase in prices.

The index number of British security values showed two rather well defined trends; from 113.6 in Jan. 1941, the index fell to an April low of 112.4, thereafter rising steadily until November, when it closed at 117.8.

Efforts were focused on the expansion and protection of the shipbuilding industry, and the convoys of the pooled British and U.S. navies began to improve the safety of trade. The solution of the shipping problem was further aided by the formation of an anti-axis shipping pool, the shortening of the lines of supply, the elimination of unessential and bulky goods, and merchant shipbuilding in the U.S. At the close of 1941, about 43% of national industrial capacity was employed in war production.

Germany.—Statistical reliability of the data relative to business conditions in Germany and German-occupied Europe is questionable because of its military value to axis enemies, but probably 66% of the industrial capacity was engaged in war production. Statistics of 17 selected industries for Dec. 1941 show that the average of weekly working hours had been gradually rising. The great increase in the number of married women working only half-days or five days a week made the average working week for women about seven-eighths that of the men's 51-hr. week. Abrupt increases in industrial output occurred in supplies needed for the winter campaign in soviet Russia—primarily clothing, candles, oil lamps, stoves, skis and chemicals. Railways, overburdened with great increases in freight traffic, were compelled to reduce passenger schedules, to provide for heavier loadings, and to divert heavy traffic to inland waterways wherever possible. Production of substitutes such as synthetic oils, rubber and artificial textiles, definitely soared. Many industries of special wartime significance such as chemicals and aluminum were placed under governmental control and operation but not ownership. War taxes on tobacco and alcohol were raised, and the "iron savings" developed into a supplementary wage tax.

Economic warfare became an important phase of totalitarian war, and special attention was given to industrial collaboration with the occupied countries. Subcontracting with industries in occupied countries expanded in the summer of 1941, but in the last quarter of the year the industries of Belgium, Holland, France and Czechoslovakia were no longer guaranteed coal, iron and steel, while industry in occupied U.S.S.R. was officially at a standstill.

Collaboration with the "protectorates" on the continent consisted in economic reorganization of national economies, in turning over the management of mills and factories to German officials and workmen, in the mass migrations of skilled labourers from occupied countries into Germany, the deportation of Jews to agricultural areas, the importation of seized food reserves from occupied countries, and in the conversion of peacetime industries to war purposes of the reich. Two types of markets developed: the public market and the black market, founded on secret exchange. In certain public markets in Czechoslovakia eggs were reported to have sold during Nov. 1941 for 18 cents each, and butter, at $2.40 per pound. The reich pursued the policy of paying for necessary war imports by exporting Czech sugar.

Finland.—Finland faced an acute labour shortage in 1941 which prevented the export of paper and cellulose products to Germany to buy necessary food supplies. Shortages arose in iron, tin and cotton. A long summer drought and early frosts caused a dearth of winter supplies of food, fruits and vegetable products. The fat ration in Oct. 1941 dropped to 21 oz. of margarine weekly, and the weekly milk ration to 1 pt. per person. An abnormal scarcity of firewood, coal and coke required severe rationing, since only 30% of the normal fuel supply was available for the winter of 1941–42.

Belgium.—This country may be assumed to be typical of German-occupied Europe. Of about 1,500,000 industrial workers who were employed in 1939, roughly 210,000 were transported directly to Germany and about 190,000 were working in Belgian manufacturing plants converted to German use. Workers who refused to comply with requests for transference were discharged and denied unemployment relief. Steel plants lacked Swedish and French ores, and could not supply railways and shipbuilding yards with the manufactured products demanded by Germany. The Belgian textile industry operated at about 30% of prewar capacity. The glass industry was merged into the German cartel, and German control was extended over prices, banks, steel, food supplies, allocation of raw materials and factory orders by the ministry of economic affairs directed from Berlin.

Switzerland.—Severe drought resulted in an inadequate food supply for 1941. Since the warring nations could not part with ships for peacetime purposes, Switzerland was obliged to charter seven ships, flying its own flag, to import food from America. These ships unloaded at Genoa or Marseilles, where the German and Italian control commissions deducted 10% of all cargoes. The value of foreign trade in 1941 reached the highest level since 1937, though its volume was about 30% below that of 1938. For the first nine months of 1941, imports totalled 1,475,000,000 francs and exports about 1,093,000,000.

Coal shortages imposed a 50% restriction in its use, with 60° F. the legal indoor maximum. Hot-water supply was limited to one day every fortnight, and the use of electricity was restricted by water shortage.

(E. H. He.)

Butter. While production of other dairy products increased sharply in the United States in 1941, owing to huge federal government purchases of cheese and evaporated and dry milk for lend-lease export to Britain, butter production remained practically stationary. From March 15 to Dec. 1, the government bought only 65,787 lb. of butter, at a cost of $20,508. In contrast, the department of agriculture bought for lend-lease export in the same period 137,566,710 lb. of cheese, 32,419,520 lb. of dry skim milk, 2,575,500 lb. of dry whole milk and 13,570,430 cases of evaporated milk, all at a total f.o.b. cost of $81,152,159. (*See* Cheese; Dairying; Milk.) In addition, the department paid $199,786 for 1,786,250 lb. of oleo oil, largely used in making butter substitutes. As a result of this war-dominated market, whole milk that ordinarily would go into butter production was diverted to cheese factories and condenseries. Butter prices, however, were maintained at substantial levels by the Dairy Products Marketing association, an organization of co-operative dairies which draws financial support from the government. Supplies purchased by the department of agriculture, while predominantly for export, were available in 1941 for Red Cross and other relief purposes.

Oleomargarine.—Much more disturbing to the United States butter industry than any wartime changes in production and markets was the government's adoption of the McNutt standard for oleomargarine, which liberalized the formerly strict regulations governing the sale of this product and permitted the substitute to become a more formidable competitor. For 40 years or more the dairy industry had fought the competition from oleomargarine and had, until 1941, been generally successful in furthering legislation to curb the sales of butter substitutes. With the adoption of the new standard, oleomargarine may be fortified with vitamin A. It may be artificially coloured and flavoured to resemble butter. The oleomargarine manufacturers were quick to seize this opportunity to broaden their market and began a national advertising campaign. The dairy organizations, including such powerful farm and manufacturing groups as the National Co-operative Milk Producers federation, the National Dairy union and the American Butter institute, introduced various measures in congress to nullify the McNutt standard, among them a proposed law to put the oleomargarine industry under the jurisdiction of the department of agriculture. The McNutt standard is a regulation under the food and drugs act. Farm opposition to oleomargarine, however, did not have the practically undivided support of agricultural groups that it formerly had. Cotton-seed oil, instead of imported coco-nut oil, was the principal ingredient in oleomargarine, and many cotton growers in the south saw in the expanded sale of butter substitutes an advantageous outlet for cotton-seed oil.

Creamery Butter.—Production of creamery butter in the United States in the first 11 months of 1941 was 1,782,710,000 lb. compared with 1,709,668,000 lb. in the same period of 1940 and a ten-year (1930–39) average (for 11 months) of 1,572,600,000 lb. For the 12 months of 1940 production was 1,836,256,000 lb. The full year, 1941, production would be about the same as that of 1940 or slightly less, the department of agriculture estimated. Eleven months' butter production in Canada in 1941 was 273,507,255 lb., an 8.6% increase over the same period in 1940.

(S. O. R.)

Byram, Harry E. (1865–1941), U.S. railroad executive, was born Nov. 28 in Galesburg, Ill. In 1881 he worked as a call boy for the Chicago, Burlington and Quincy railroad. Twenty-nine years later he was vice-president of the C. B. & Q. In 1917 he was named president of the Chicago, Milwaukee and St. Paul railroad and was manager of the line during World War I when the government ran the nation's roads. He was chairman of the board of the Chicago, Milwaukee, St. Paul and Pacific from 1927 until his death Nov. 11 in Fairfield, Conn.

Byrnes, James Francis (1879–), U.S. jurist, was born May 2 in Charleston, S.C., of Irish parentage. At the age of 14 he left school to become office boy of a law firm. By studying stenography, he advanced to the position of court reporter. In 1910 he was elected to congress on the Democratic ticket and was re-elected six times, serving from 1911 to 1925. As a member of the deficiency committee during World War I he frequently met Franklin D. Roosevelt, then assistant secretary of the navy, with whom he formed a lasting friendship. In 1930 he was elected to the U.S. senate, and was re-elected in 1936. In June 1941 he was appointed associate justice of the U.S. supreme court by President Roosevelt. Generally considered a conservative, he followed, for the most part, the leadership of the president, although he opposed him on the supreme court reorganization plan.

Cabinet Members. The following members of President Roosevelt's cabinet held office on Jan. 1, 1942:

Post	*Name*	*State*
Secretary of State	Cordell Hull	Tennessee
Secretary of the Treasury	Henry Morgenthau, Jr.	New York
Secretary of War	Henry L. Stimson	New York
Attorney-General	Francis Biddle*	Pennsylvania
Postmaster General	Frank C. Walker	Pennsylvania
Secretary of the Navy	Frank Knox	Illinois
Secretary of the Interior	Harold L. Ickes	Illinois
Secretary of Agriculture	Claude R. Wickard	Indiana
Secretary of Commerce	Jesse H. Jones	Texas
Secretary of Labor	Frances Perkins	New York

*Sworn in Sept. 5, 1941 to succeed Robert H. Jackson

Great Britain.—At the close of 1941 the war cabinet was composed as follows:

Post	*Name*	*Party*
Prime Minister, First Lord of the Treasury and Minister of Defense	Winston Churchill	Conservative
Lord Privy Seal	C. R. Attlee	Labour
Lord President of the Council	Sir John Anderson	Conservative
Secretary of State for Foreign Affairs	Anthony Eden	Conservative
Minister without Portfolio	Arthur Greenwood	Labour
Minister of Supply	Lord Beaverbrook	Conservative
Chancellor of the Exchequer	Sir Kingsley Wood	Conservative
Minister of Labour and National Service	Ernest Bevin	Labour
Minister of State	Oliver Lyttelton	Conservative

For other ministers and members of the government *see* Government Departments and Bureaus.

Cacao: *see* Cocoa.

Cadmium. Little information was available on cadmium production outside of the United States, but it was probable that the 1941 output exceeded the 4,500 metric tons estimated as the world total in 1940. In the United States, production increased by 34% and sales by 20% in 1940 as compared with 1939; sales were 5% ahead of production, and consumption rose to a new record-high, at 6,951,300 lb. Imports declined to 27,491 lb., and 127,776 lb. was exported. (G. A. Ro.)

Caldecott Medal: *see* AMERICAN LIBRARY ASSOCIATION; CHILDREN'S BOOKS.

Calendar of Events, 1941: *see* pages 1–16.

California. A Pacific coast state of the United States, thirty-first state to enter the union (Sept. 9, 1850); popularly known as the "Golden state." Area: 156,803 sq.mi.; pop. (1940) 6,907,387 (1930: 5,677,251), a greater increase (21.7%) than in any other state. Japanese (racial origin) totalled 93,717 (73.8% of all in the U.S.), of whom 33,569 were alien foreign-born. In 1940, 71% of the population was urban. Capital, Sacramento (105,958). Other chief cities: Los Angeles (1,504,277); San Francisco (634,536); Oakland (302,163); San Diego (203,341); Long Beach (164,271); Berkeley (85,547); Glendale (82,582), Pasadena (81,864). Fifty other cities exceeded 10,000.

History.—Unprecedented industrial expansion and revolutionary changes in economy characterized California in 1941, as the state's resources were mobilized to meet the national emergency.

National defense highlighted the regular session of the legislature, which approved legislation creating a 30-man council to co-ordinate defense preparations of state and local government, heavily penalizing sabotage and subversive activities, and establishing a program designed to forestall disruption of economy by labour disturbances. A labour-sponsored anti-injunction bill and a "Little Wagner act" were defeated. An act outlawing secondary boycotts was passed over the veto of Gov. Culbert L. Olson (Dem.), but a referendum petition suspended it pending submission to the electorate in Nov. 1942. On the basis of the 1940 census, two new assembly districts were granted to Los Angeles county and one each was taken from San Francisco and Alameda; two congressional districts were added to southern California and a third to the central coast area.

Following the outbreak of war with Japan, coastal cities experienced frequent blackouts as unidentified planes were reported offshore. A special session of the legislature called to finance defense preparations granted only $1,000,000 of the $10,000,000 requested for the governor's emergency fund, but appointed a joint legislative committee to study defense needs in preparation for further appropriations in Jan. 1942.

Education.—For the 1941–43 biennium, $152,937,900 was allotted to public elementary and secondary schools. These had 1,195,024 pupils and 42,180 teachers in 1937–38 and a 1940–41 average daily attendance of 1,048,150. In 1940–41 the University of California (state support 1941–43: $21,241,334) had 29,235 regular students and 5,298 instructors (3,022 full-time), and the seven state colleges (support: $5,984,235) 11,559 students and 544 full-time instructors. There were 102 institutions of higher education, with 8,749 full-time instructors in 1937–38, and 86,372 undergraduates and 6,695 graduates in residence.

Charities and Correction.—The industrial upsurge enabled a reduction of the state relief appropriation from $77,364,000 for 1939–41 to $3,790,000 for 1941–43. On May 30, 1941 the total case load was 31,431 (involving 110,163 persons), compared with 72,731 cases and 228,375 persons at the end of May 1940. During the fiscal year 1940–41, federal, state and county contributions to the aged (156,300 persons) totalled $68,478,527; 42,533 dependent children received $10,000,083, and 7,346 blind persons $4,204,767. The state maintained seven hospitals for the insane and two homes for mental defectives (est. average patients 1941–42: 26,903), and four prisons (average inmates 1940–41: 8,117).

Finance and Banking.—The 1941–43 state budget, including special appropriations, was $521,297,039 (1939–41: $566,056,899), of which $290,720,244 represented subventions to local government, including $162,378,251 for education. State tax collections during the fiscal year 1940–41 were $361,500,000, of which $109,233,972 was derived from the sales tax. The general fund deficit was $40,000,000 on June 30, 1941 (June 30, 1940: $82,110,559); estimated general fund revenues of $408,224,000 for 1941–43 were expected to result in a $50,000,000 surplus on June 30, 1943. Net bonded debt was $158,906,013 on June 30, 1941. On Sept. 24, 1941 there were 225 banks (129 state, 96 national), with deposits of $4,651,386,000, investments of $1,937,931,000, and loans of $2,170,735,000. Bank debits at 15 principal cities increased 20.3% in 1941, to $38,893,286,000.

Communication.—In 1940 there were 14,088 mi. of steam and 2,768 mi. of electric railways. Rural public roads in 1937 aggregated 99,560 mi., city streets approximately 18,209 mi., of which 52,632 mi. were surfaced. In 1940 California had more motor vehicles than any other state (2,990,262, or one for each 2.3 persons). Business telephones numbered 667,010 (27.87% more than in 1935); residential, 1,056,147 (39.15% more).

Agriculture.—Gross farm income in 1941 was $850,672,000, an all-time high, 26.5% over 1940 and 11% over 1929; the increase resulted principally from higher prices. Field crops (production 9,630,190 tons) were valued at $215,861,000; fruit and nuts (6,373,000 tons) $240,827,000, and vegetables and melons $105,881,000.

In 1940 there were 132,658 farms, aggregating 30,524,324 ac. (12,894,974 ac. available for crops), and valued at $2,166,452,648. The total value of livestock on Jan. 1, 1941 was $187,917,000.

Principal Agricultural Products of California, 1941

Crop	Unit	Production, 1941	Value, 1941
Oranges	boxes	47,284,000	$99,070,000
All tame hay	tons	4,588,000	53,680,000
Grapes	tons	2,411,000	40,585,000
Cotton (lint)	bales	410,000	35,324,000
Lettuce	crates	14,732,000	26,645,000
Beans (dry)	lb.	513,900,000	20,110,000
Peaches	bu.	22,252,000	22,401,000
Barley	bu.	25,529,000	18,381,000
Tomatoes	tons	746,700	18,331,000
Potatoes	bu.	20,951,000	17,250,000

Manufacturing.—Demand for war materials spurred California's manufacturing activity to new high levels in 1941. The number of factory employees increased 59%; payrolls nearly doubled, with average earnings rising about 25%. Factories producing essential war materials employed some 360,000 workers at the end of 1941.

Major defense contract awards and allocations to California during the 17-month period June 1940–Oct. 1941 totalled approximately $3,655,092,000, 11.9% of the national total, exceeding awards to the second highest state (New York) by more than $1,000,000,000. Of this amount, $1,879,810,550 was for aircraft production, $1,082,000,000 for shipbuilding, and $202,656,095 for construction of industrial plant facilities (principally aircraft and shipbuilding plants). In 1939, California manufacturers of aircraft and their parts (including aircraft engines) produced some $89,327,595 worth of products, and employed an average of 23,286 workers, who received $38,454,453. On Sept. 1, 1941 the seven largest of the state's 24 aircraft manufacturing firms had 127,206 employees; they received $1,435,287,931 of published U.S. contracts from June 1940 to Oct. 1941, at which time their reported backlog of unfilled orders was $2,600,764,622. Shipping contracts in the state between Sept. 1939 and July 1941 called for 292 vessels valued at $1,028,063,152. San Diego was an important centre of the aircraft industry and of naval activity.

In 1939, before the impact of war demands on state economy, there were 12,329 industrial establishments, with 275,477 workers receiving wages of $365,114,000, and with products valued at $2,798,180,000. Chief industries (with value of products) were: food and kindred products ($897,762,000); products of petroleum and coal ($397,207,000); iron, steel and products (except machinery) ($208,258,000); chemicals and allied products ($167,529,000); printing and publishing ($138,860,000); automobiles and automobile equipment ($119,428,000); non-automotive transportation equipment ($106,256,000); non-electrical machinery ($102,643,000); apparel and other finished products ($97,721,000); lumber and timber basic products ($87,193,000).

Mineral Production.—Production in 1940 was valued at $342,825,817 (1939: $352,462,564), of which petroleum, with a production of 223,294,805 bbl., accounted for $207,479,800 and natural gas (output 352,871,945 m.cu.ft.) $20,618,893. Metals were valued at $59,949,838, structural materials $34,739,319, salines $13,674,519, and industrial materials $6,357,748. Chief metals, with 1940 production and value, were: gold, 1,455,671 fine oz. ($50,948,485); quicksilver, 18,907 flasks of 76 lb. ($3,209,754); tungsten, 1,784 tons (60% WO_3 concentrate) ($2,267,135); silver, 2,359,776 fine oz. ($1,678,063); copper, 12,833,363 lb. ($1,450,170); lead, 3,092,636 lb. ($154,632); platinum metals, 1,358 fine oz. ($62,419); chromite, 2,599 tons ($32,796); zinc, 182,088 lb. ($11,472); antimony, 58,845 lb. ($7,958).

California, University of. An institution of higher learning at Berkeley, Calif. Because of its size and the scope of its activities, this institution was greatly influenced by national defense needs during 1941. A defense council of 50 faculty members was organized. A series of defense industry training courses was established, primarily for the aeroplane and shipbuilding industries, and approximately 4,000 men and women were given training by Sept. 1941. Efforts were also made to interpret the world situation for the general public by means of public lectures in all parts of the state.

A greater appreciation of U.S. civilization was fostered among students by the inauguration of lecture courses on the Berkeley and Los Angeles campuses and by an extensive citizenship program introduced in the fall of 1941. Approximately 150 members of the faculty were given leave of absence for service in the armed forces or for defense research projects. The university's oceanographical research ship, "E. W. Scripps," was loaned to the U.S. navy for the duration. The regents of the university adopted a policy of investing endowment funds in U.S. defense bonds as rapidly as government regulations would permit.

The university decided in 1941 to award a new degree, Associate in Arts, to all students satisfactorily completing the first two years of their university course. Also, students were no longer to be penalized for poor scholarship in one course by subtraction of grade-point credit earned in other courses, but they were to be held more strictly to the "C" average minimum for continued residence on campus.

At the request of the university, the state legislature and the governor made appropriations of $2,500,000 for the construction of a $2,000,000 hospital addition to the medical centre in San Francisco and for the construction of facilities for a school of veterinary medicine in the college of agriculture. During "Charter week," gifts to the university totalling $2,750,000 were announced. As a result of defense calls and unsettled conditions, registration dropped approximately 10% in 1941. Registration of full-time resident students amounted to 28,485 for the academic year 1940–41. Volumes in the libraries increased to 1,873,564. (R. G. S.)

Cambodia: *see* FRENCH COLONIAL EMPIRE.

Cambridge University. A British university at Cambridge, England. In the Michaelmas term 1941 there were 2,756 men and 515 women *in statu pupillari;* the number of students evacuated from London was 1,756. There were ten professorial chairs vacant by death or retirement, but university elections were suspended till more suitable times. The customary conferment of honorary degrees was also suspended. Despite diminished numbers, accommodation was strained because of the housing of government departments and other war requirements. Building and reconstruction had ceased, and the formal opening of the Austin wing of the Cavendish laboratory was deferred. As the government grant was undiminished, the financial position was steady.

The senior training corps for the army was expanded, and the air squadron was reconstituted so that students were receiving training during their residence. Few men, however, stayed beyond their second year; and membership in one of these bodies was a condition of deferment of service. College social life continued with vigour and students' societies flourished.

Campbell, Sir Gerald (1879–), British diplomat, was educated at Trinity college, Cambridge. He entered the consular service in 1906 and was vice-consul at Rio de Janeiro, 1907. He served later in the Belgian Congo and at Venice, and was consul at Addis Ababa, 1915–19. After World War I he was sent to the U.S., acting as British consul-general first in Philadelphia, then in San Francisco, and, from 1931 to 1938, in New York city. He was knighted in 1934 and was high commissioner for the United Kingdom in Canada, 1938–41. In Jan. 1941, Lord Halifax (*q.v.*), British ambassador to Washington, appointed him minister to the U.S. For the first time in history, Great Britain had an ambassador, Lord Halifax, and two ministers, Nevile Butler and Sir Gerald Campbell, in Washington.

In June 1941, he resigned to become director-general of the British information service in the U.S.

Camp Fire Girls. During 1941, Camp Fire Girls were in training to serve their country both in peace and in war. Emphasis in 1941 was placed on understanding and appreciating the privileges and responsibilities of democracy. A special project was planned for Camp Fire Girls that would engender appreciation of the contributions of many countries to make the United States culture. This was called Treasure Trails—the girls being encouraged to explore the treasure trails of art which led from all the nations of the world to the United States. In their own towns they became better acquainted with the opportunities for art appreciation—the museums, concerts, clubs, public exhibitions and private art collections that might, if they knew how to use them to advantage, enrich their lives.

Believing that the strength of the nation is dependent upon the health and strength of the family, Camp Fire Girls launched a project based on their home craft program in the fall of 1941. Careful planning of meals for their nutritional value, wise marketing and appetizing preparation of food were stressed. The girls practised on "a dinner for a dollar for a family of four."

The majority of Camp Fire groups participated in the celebration of the 150th anniversary of the adoption of the Bill of Rights. (Camp Fire membership grew to 320,236 during 1941.)

At the meeting of the National council in Detroit, Mich., in Oct. 1941, resolutions were passed calling upon Camp Fire leaders to help each girl develop her best and most helpful potentialities in order that she might be a happy and useful member of society. In December, a specific "Service for Victory" program was drawn up. The Honourable Franklin D. Roosevelt was in 1941 honorary president of Camp Fire Girls and Mrs. Roosevelt was honorary chairman of the advisory committee. The other officers were: Mrs. Elbert Williams, president; Lester F. Scott, national executive; and Ward L. Johnson, treasurer. Lady (Walter) Hearn is president of British Camp Fire Girls. (C. F. Lo.)

Campinchi, César (1882–1941), French statesman and lawyer, was born May 4 at Calcatoggio, Corsica. He studied law in Paris and was admitted to the bar in 1907. After serving in World War I, during which he had been seriously wounded, he returned to law and swiftly rose to fame as one of the most brilliant criminal lawyers in France. Known for his sharp tongue and acid wit, Campinchi participated in a score of famous cases, and French courtrooms were always packed when he pleaded. He entered politics in 1930 and two years later he was elected deputy from Bastia. He rose to leadership of the Radical Socialist party in 1936 and was subsequently appointed navy minister by Daladier, a post he retained until the collapse of France in June 1940. After the Franco-German armistice, the French nationalist press demanded the arrest of Campinchi on charges that he was one of those responsible for leading France into a war for which she was not prepared. But the government took no action and Campinchi lived in retirement in Marseilles, where he died Feb. 23.

Canada, Dominion of. A dominion of the British Commonwealth of Nations (Statute of Westminster, 1931, 22. Geo. V.c.4.) covering all the portion of

North America north of the United States, except Newfoundland, Labrador and Alaska. The dominion is a federal union of nine provinces united under the terms of the (imperial) British North America act of 1867—Ontario, Quebec, Nova Scotia and New Brunswick in 1867, Manitoba 1870, British Columbia 1871, Prince Edward Island 1873, Alberta and Saskatchewan 1905. Outside the provincial boundaries, the Yukon and Northwest Territories are under the federal government. There is no statutory national flag; in most common use is the Red Ensign with the dominion coat of arms in the field; the union jack, usual on public buildings and permitted elsewhere; the other ensigns as under the king's regulations. In French Canada the French tricolour is also unofficially flown. Area, 3,729,665 sq.mi.; pop. (1941) 11,419,896. Capital, Ottawa (pop. 150,861). Montreal is the largest city (city proper 882,398). Provincial capitals in the order of the provinces listed above are Toronto (city limits 657,612); Quebec (147,002); Halifax (69,326); Fredericton (9,905); Winnipeg (217,994); Victoria (41,787); Charlottetown (15,049); Edmonton (92,404); Regina (56,520). Other leading cities are Vancouver (271,597); Hamilton (164,719); St. John, N.B. (50,084); Kingston (29,545); Fort William (30,370); Port Arthur (24,217); Saskatoon (42,269).

There is no state religion nor established church, but the privileges of religious minorities and the status of the Roman Catholic Church are safeguarded by the terms of federation. The census of 1931 recognized 34 groups, of which the chief were Roman Catholic, 4,285,388; United Church, 2,017,375; Anglican, 1,635,615; Presbyterian, 870,728; Baptist, 443,341; Lutheran, 394,194; Greek Orthodox, 102,389; Jewish, 155,614; Mennonite, 88,736.

The governor general in 1941 was the earl of Athlone (*q.v.*); prime minister, William Lyon Mackenzie King (*q.v.*). The house of commons is elected; the senate is appointed.

History.—The dominion government continued during 1941 under the leadership of Mackenzie King and the Liberal party, re-elected March 26, 1940. On the resignation of R. B. Hanson, the National Committee of the Conservative party in November invited the Rt. Hon. Arthur Meighen (*q.v.*) to lead the opposition. Meighen, in accepting the post, urged conscription for service overseas. King, in a speech to the house of commons Nov. 12 announced that "without any consultation of the people on that subject, I do not intend to take the responsibility of supporting any policy of conscription for service overseas." The session of parliament which began in 1940 carried on till June 14, 1941. Parliament reassembled on Nov. 4 and adjourned Nov. 14 until Jan. 21, 1942.

In provincial politics, general elections were held in October in both British Columbia and Nova Scotia. In Nova Scotia, the government of A. S. Macmillan (Liberal) was sustained (23 out of 30 seats). He had succeeded to office in 1940 when the premier, Angus Macdonald, resigned to accept the portfolio of minister of naval defense in the federal cabinet. The result in British Columbia showed a lack of a clear majority which led to the formation of a coalition government with John Hart as premier.

In March a coalition government was formed by Premier Bracken of Manitoba, who had won 51 out of the 55 seats in the general election held in April 1940. Among the federal cabinet changes in 1941 were: the appointment of J. T. Thorsen as minister of national war services in June; that of L. S. St. Laurent as minister of justice, Dec. 11 (on the death of Sir Ernest Lapointe); Humphrey Mitchell, minister of labour, Dec. 15; N. A. McLarty, secretary of state. In the diplomatic field, Leighton G. McCarthy was appointed minister to Washington (Feb. 25) to succeed Loring Christie (*q.v.*), who resigned because of illness in February and later died (April 8). In July John D. Kearney was appointed Canadian high commissioner to Eire to succeed the late John Hally Kelly. In February Malcolm Macdonald was appointed high commissioner to Canada, *vice* Sir Gerald Campbell, who was appointed to the British embassy at Washington; C. J. Burchell, to Newfoundland (July); Jean Desy to Brazil; former Chief Justice W. F. A. Turgeon became the first minister of Canada to Argentina in September.

It was announced in November that Major Gen. Victor W. Oldum, commander of the 2nd division overseas, had been named Canadian high commissioner to Australia. Major Gen. H. D. G. Crerar (*q.v.*), previously chief of the Canadian general staff, went overseas to command the division. In November it was also made known that Rear Adm. Percy W. Nelles, chief of naval staff, had been made a vice-admiral, the first Canadian ever to be given this rank. On Dec. 15 Wing Commander Ernest A. NcNab was appointed liaison officer between the royal Canadian air force and the United States army air corps on the west coast.

Various other appointments during the year included that of R. C. Berkinshaw in February as director-general of the priorities branch of munitions department to control allocation of war supplies and transport. In April J. S. McLean joined the British Purchasing commission in Washington. In September Morris Wilson, president of the Royal Bank of Canada, was named chairman of the British Supply council in New York city, succeeding Arthur Purvis who tragically lost his life returning by plane from England. E. P. Taylor of Toronto was appointed chief executive officer of the same council in September. During the year a number of Canadian officials visited Britain by aeroplane, including the prime minister (Aug. 20, his first air flight), Messrs. Howe, Power and Macdonald of the cabinet, Adm. Nelles and Col. George Drew, leader of the Conservative opposition in Ontario. A group of newspaper men went to England (November) as guests of the British press.

Wendell Willkie (*q.v.*) visited Canada during March and spoke in both Toronto and Montreal on behalf of the campaign to raise funds for the National Auxiliary War services. The duke of Kent visited Canada and the United States in August, arriving by bomber July 29 and returning early in September. He flew some 15,000 mi., made an extensive inspection of the British commonwealth air training and visited U.S. aircraft factories.

Of interest to Canadians was the honour bestowed upon the former prime minister, R. B. Bennett, who was made a viscount in the honours list of King George VI's birthday, June 12.

Canada and the United States.—On March 19 Prime Minister Mackenzie King and J. Pierrepont Moffat, United States minister to Canada, signed a Canadian-U.S. agreement on the co-operative development and utilization of the Great Lakes-St. Lawrence river basin for the national defense of both countries. The estimated cost of this plan was $266,170,000 (the United States share, approximately $206,000,000) and provided for the deepening and developing of the river system, additional hydroelectric power and navigation facilities. It was expected that the scheme would be completed by 1945, a prospect entirely altered by the entry of the U.S. into the war.

At the same time the Canadian-U.S. Joint Defense board announced the completion of plans for the military and naval defense of the Atlantic and Pacific coasts of both countries. Earlier in the year (Feb. 15) Mr. Power, minister of air, said that on the recommendation of the Joint Defense board, the Canadian government was to build a chain of air-defense bases through Alberta and British Columbia to Alaska. There would be four intermediate bases between Edmonton and White Horse, viz.: Grande Prairie, Fort St. John, Fort Nelson and Watson lake. Vancouver would be connected to Fort St. John by bases in Kamloops, Wil-

liams lake and Prince George, with an additional aerodrome at Prince Rupert. The cost of the operation would be about $9,000,000.

In March an agreement was reached between the United States and Canada to build and arm vessels in the Great Lakes yards, the vessels to be promptly removed as soon as completed. Many manifestations of the co-operation of the United States and Canada were shown throughout the year. A number of meetings of the Canadian-U.S. Joint Defense board were held, with Mayor Fiorello La Guardia (*q.v.*) as co-chairman. In August a 236-mi. oil pipe line was welded at Highwater, Que., at an international ceremony. This pipe line was completed in the fall from Portland, Me., to Montreal. On Nov. 1, a new international bridge, the Rainbow bridge, over Niagara, was opened.

During 1941, Prime Minister Mackenzie King made three important visits to the president of the United States, in March, April and at the end of October. After the April meeting the "Hyde Park agreement" was announced—a joint statement on hemisphere defense and aid to Britain and the democracies, each country to provide the other with the defense materials it was best able to produce quickly. Canada was to supply the United States with from $200,000,000 to $300,000,000 of strategic materials: aluminum, nickel and other supplies. The United States was to pay Canada with U.S. dollars, thus strengthening Canadian foreign exchange. Moreover, Canada was not to pay for that portion of defense material purchased in the United States which consisted of unfinished war products for Britain, as this was to come under the lend-lease act for aid for Britain.

Labour.—The unemployment insurance scheme went into effect July 1, 1941, 105,084 Canadian employers having requisitioned 2,295,877 books for employees. The governing commission estimated that, in all, 2,500,000 workers would come within provision of the act setting up the organization to collect contributions from employers and employees and pay benefits to employees who lose employment.

Strikes.—In May the federal government undertook further steps to prevent the stoppage of work in industries with war contracts, by extending to them the terms of the industrial disputes act of 1907 (delay till arbitration is tried). Slow-down strikes in the coal mines at Glace Bay, N.S., after much loss of production, ended in resumption of work. A five-day strike at Arvida (P.Q.) (July 29), which led to the calling in of troops, was settled by arbitration. A strike of 4,000 employees at St. Catherines, Ont. (Sept. 11) and one at the Kirkland lake gold mines, were all settled finally by arbitration.

The year came to a fitting close with the visit of Winston Churchill (*q.v.*) to Ottawa (Dec. 29). An unparalleled ovation which greeted him and his address before an unofficial gathering of members of the parliament of Canada assembled in the senate chamber, in which he especially denounced the Vichy government, breathed defiance to the enemy and confidence in victory.

(S. LEA.)

Canada at War.—At the opening of 1941 Canada had been at war with Germany since Sept. 10, 1939 and with Italy since June 10, 1940. Participation in the war had met with universal approval, although conscription for overseas was, with equal unanimity, held as yet unnecessary. During this period of 15 months, the dominion had sent overseas some 90,000 men, had adopted an act for compulsory home service, and had initiated the commonwealth air-training plan. In addition, a wide program of manufacture of munitions, war equipment and fighting planes had been undertaken. In point of finance Canada had spent $2,183,000,000 (aid to Britain included), partly defrayed by increased taxation, partly by loans. Reports of war casualties up to the beginning of 1941 showed 736 killed, 285 died, 345 wounded and 195 missing. On Nov. 26, 1941, the total of dead and missing was 2,335 (navy, 408; army, 893; air force, 1,034).

Voluntary enlistments for service anywhere were as follows: navy, more than 27,000; army, more than 240,000; air force, more than 93,000; total, 360,000. The number who had volunteered to serve anywhere was more than 500,000. Of those enlisted for service in Canada, members of the reserve army liable to be called out for home defense numbered more than 145,000; men conscripted for the duration of the war for service in Canada numbered more than 150,000.

Compulsory military training was introduced in June 1940 under the authority of the National Resources Mobilization act. All single men and widowers without children, aged 19 to 45, are liable for military service in Canada. The first group to be given 30 days' basic training under the authority of this act went to camp in Oct. 1940. In the succeeding months, about 87,000 men were called up. About 20,000 of these joined the active forces; the rest were posted to the reserve army for part-time training. In Feb. 1941, the period of preliminary training was increased to four months; in March, the first four-month class went to camp; and shortly afterward it was announced that "conscripts" would be kept indefinitely in the army. At the end of 1941, the Canadian "draft" was calling up the 21–24 age group.

Students attending universities were exempt from the draft but had to take military training under a government-approved universities' training plan. A committee of the War Legion Services, Inc., under the chairmanship of Lieut.-Col. Wilfrid Bovey instituted a complete interprovincial bilingual school system available to the men in all services. The department of national war services was recruiting women for auxiliary service with the army and the air force to do administrative work, light transport driving and the like, to release men for combatant duty.

When the royal Canadian navy went into action in Sept. 1939, it mustered 15 vessels, 6 of them destroyers. By the end of 1941, the Canadian navy had increased its strength in ships to something over 300. By March 1942 it was expected that Canada would have a navy of 400 ships. The royal Canadian navy had played a very important part in the convoying of Canadian and U.S. supplies to Britain. So far as freight convoys were concerned, no fewer than 7,000 ships had left Canadian shores for Great Britain by Dec. 1941, and had carried 42,500,000 tons of cargo.

Ships and men of the navy co-operated with the royal navy in many parts of the world. Early in the war they helped to convoy Australian troop ships to battle areas. They operated off the French coast during the evacuation in June 1940. Canadians did notable work at Boulogne and Dunkirk, and later in the evacuation of Greece and Crete. In the waters around the British Isles, Canadian destroyers and corvettes played their part in protecting the approaches to the islands. Early in 1941 a Canadian destroyer helped rescue 857 survivors from the "Arandora Star" after it had been torpedoed. In the south Atlantic and in the Pacific the navy helped to implement a blockade on enemy ships; it captured five enemy vessels and caused others to be scuttled. Late in Nov. 1941 it was announced that two Canadian corvettes had sunk a German submarine in the north Atlantic. The corvettes picked up 47 survivors. The navy also successfully protected Canadian shores and ports. Its ships patrolled the dominion coasts (5,000 mi. of mainland and island coast line on the Pacific coast alone) day and night.

Of the Canadian active army force of more than 240,000 volunteers at the end of 1941, about half were overseas. Some were in Newfoundland, the British West Indies, Gibraltar and Hongkong; and a large number were in Great Britain. The final contingent of the 5th (armoured) division arrived in England late in November. Canada then had in Britain the 1st, 2nd, 3rd and 5th (armoured) divisions, a tank brigade and a large force of ancillary troops. In Sept. 1941 Canadian troops, together with British and Norwegians under Canadian command, effected a landing at Spitsbergen. No enemy interference was encountered.

Canadian airmen had been engaged in combat since the outbreak of war. Many had joined the R.A.F. before war broke out, and others followed in late 1939 and early 1940. The first R.C.A.F. squadron arrived in Britain early in 1940; it was followed shortly thereafter by two other squadrons. The flow of Canadian airmen from the British commonwealth air training plan in late 1940 and in 1941 steadily increased the number of R.C.A.F. fliers at the battle front. R.C.A.F. fliers, after completing their operational training overseas, were posted either to the R.A.F. or to an R.C.A.F. squadron operating under R.A.F. command. Twenty-five of these squadrons were in action by Dec. 1941, over Britain, Europe, the Mediterranean area and Russia. For military reasons much detailed information concerning their activities was not available. The following facts, however, were known:

The "All-Canadian" squadron of the R.A.F., formed late in 1939 of Canadian and British pilots, destroyed at least 30 planes over France and the Low Countries during the battle of France in 1940 and had the honour of being the last squadron to leave French soil. It fought over Dunkirk and played its part in protecting the evacuation of British and Allied troops. It also fought over London during the September "blitz." By Jan. 1941 it had accounted for more than 100 planes. One of the first R.C.A.F. fighter squadrons to see action had an equally distinguished record. It shot down 12 enemy planes in its first 19 days of action and was credited with nearly 100 by Dec. 1941.

During the last six months of 1941, Canadian fliers took part in R.A.F. daylight sweeps over Germany and the Low Countries. They bombed Berlin and carried out attacks on the German warships "Gneisenau" and "Scharnhorst." Two Canadian squadrons were assigned to night fighting duties, and others were on coastal patrol work and attached to both the fighter and bomber commands.

The close of the year brought news of the tragic but heroic defense of Hongkong, in which two Canadian units—the Quebec Royal Rifles, mostly recruited in the eastern townships and New Brunswick, and the Winnipeg Grenadiers—played a conspicuous part.

The finance of the war was carried forward in 1941 on the same general plan as in 1940 but with even greater increase of taxation and large public loans. It was estimated that war expenditures, including financial aid to Britain, for the fiscal year April 1, 1941, to March 31, 1942, would amount to $2,350,000,000. Of that amount, taxes were expected to provide $1,500,000,000, the remainder to come from public loans.

In spite of this unprecedented scale of public expenditure, industry, commerce and public credit remained on a stable basis. The quotations for dominion securities never varied much from a 3¼% basis. War industries constantly absorbed all workers dropped and created so large a demand for labour that unemployment virtually disappeared. The do-

minion government terminated at the year, without protest, all contributions to provincial doles for unemployment. On the other hand, prices and wages rose to a point to justify some apprehensions. This condition was dealt with by a comprehensive measure which placed a ceiling on wages and prices. (See *War Price and Wage Control* below.)

As the year moved on, greater attention was drawn to the possibility of aerial attack on Canada itself, especially after the declaration of war on Japan in December. Various precautionary measures, however, had been adopted. The maritime coast led the way in the institution of blackouts and anti-aircraft defense, of which the details remained a military secret. Inland cities also instituted whole or partial blackouts. An unofficial organization, the Civilian Protection committee (A.R.P.) was formed throughout Canada, receiving government aid, but without mandatory power.

It became doubtful to many Canadians during the year whether sufficient troops could be raised without adopting compulsory conscription for overseas. Voluntary enlistment had fallen, producing in the summer of 1941 inadequate results. Conscription was then widely advocated, especially in the province of Ontario, and among the population of British birth or origin everywhere in Canada. Arthur Meighen, on assuming the leadership of the Conservative party, stressed the urgent need for conscription. All his followers, together with certain members of the Liberal party, were equally insistent in their public utterances on the need for conscription.

The entry of the United States profoundly altered the military situation in Canada. The Mobilization act was extended to service across the U.S. frontier. The obvious contrast between the United States compulsory draft for overseas and the Canadian voluntary plan seemed inconsistent with devotion to a common cause.

War Price and Wage Control.—The government of Canada adopted in 1941, under the authority of the Canada War Measures act (*Revised Statutes of Canada*, 1927), a plan for complete control over all wages and prices. The plan went into full operation, the wage part after Nov. 15, the price part after Dec. 1, 1941. The plan had two sides, a price side and a wage side. Likewise there were two ceilings, a price ceiling and a wage ceiling.

The principle of the price part of the plan was as follows: There was to be no change in the price of anything from Dec. 1, 1941. This order applied to the whole range of goods and services alike, offered for sale in Canada. Imported goods offered for sale in Canada were subject to the same regulations. The ceiling price was placed at the highest price charged during the period, Sept. 15–Oct. 11, 1941.

The government was explicit and definite in its instructions to the sellers of goods. The order stated that all goods customarily sold should continue to be sold, and sold at the ceiling price or lower. Goods not sold before were subject to the rule that "no merchandise can be priced for sale at a price higher than would have been appropriate if such goods had been sold during the basic period September 15th to October 11th." With respect to new purchases of goods, the order had this to say: "Where the manufacturers' or wholesalers' asking price is too high to enable the retailer to have his usual gross mark-up, the retailer, the wholesaler and manufacturer should arrange between themselves to absorb a fair share of this higher cost, so that the price to the consumer will not be increased."

The wage part of the plan was the same in intent as the price part, but narrower in scope. It forbade an increase in the wage of anyone above the rank of foreman or its equivalent from Nov. 17. However, employers with less than 50 employees (in building and construction, less than 10) were exempt from the order, as were hospitals, religious, teaching and other charitable organizations. Farming, fishing and hunting were not touched at all. In return, these wage earners received special treatment in the way of a cost-of-living bonus.

A cost-of-living bonus was to be paid by the employers to all the wage earners affected. Previous to the adoption of this plan, all war industries were already compelled by law to pay their workers a bonus of 25 cents per week per point rise in the cost of living over Aug. 1939. These industries had to continue that bonus and add to it an amount calculated in the same way and based on the rise in the index number for Oct. 1941 over the latest index used. The total of the bonus paid from Nov. 15 and effective to Feb. 15 was $3.65 per week, calculated on a 14.6 increase in the cost of living. The respective figures for August were 100.9; for October, 115.5. The next change was due Feb. 15, 1942, and subsequently at the end of each ensuing three months.

Employers who had not been paying the bonus, and came under the order, had to start to pay it and continue to pay it from Feb. 15, 1942, on the basis of the rise in the cost of living from Oct. 1941 (the date of order) to Jan. 1942.

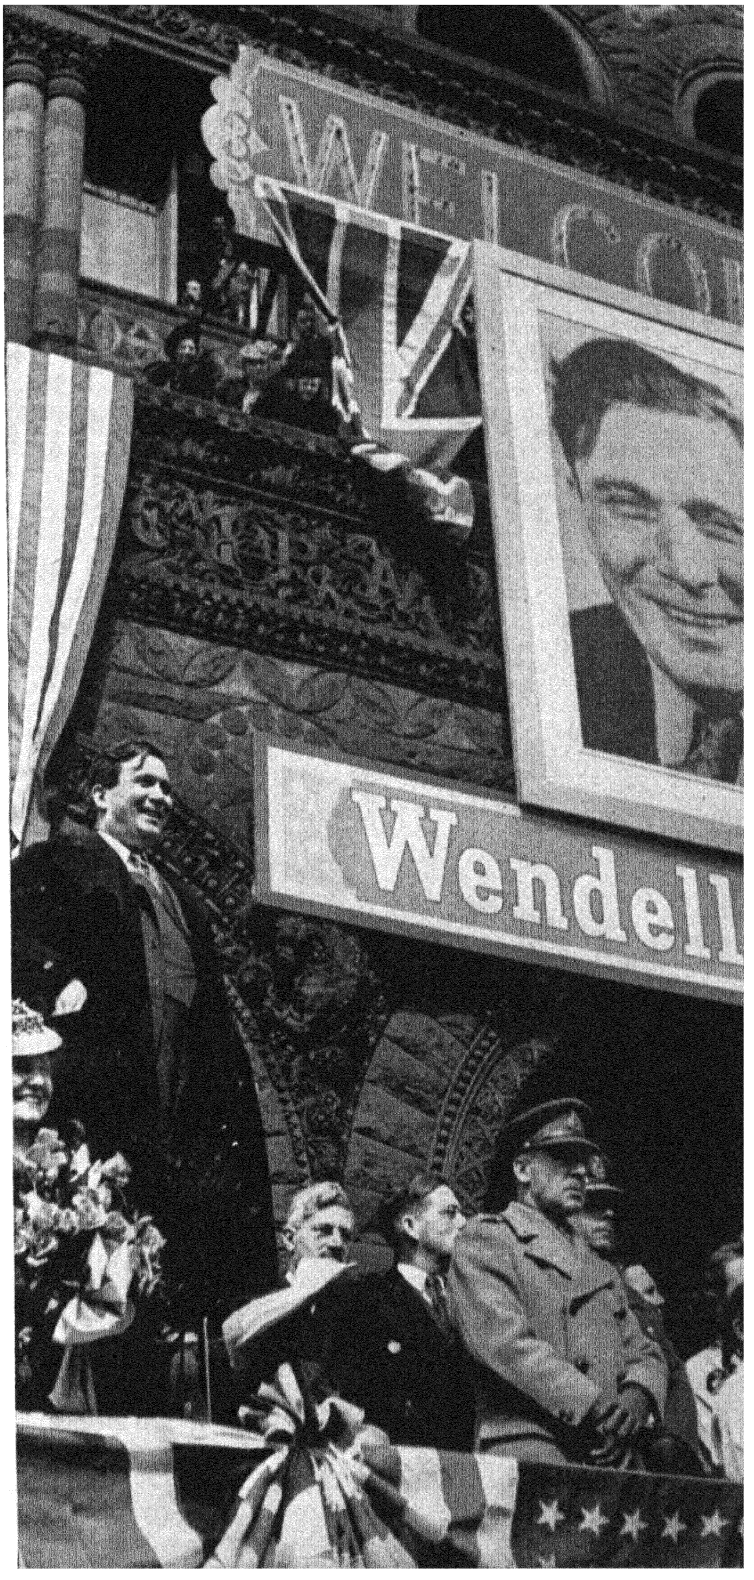
Male employees under 21 years of age and all female employees earning less than $25 per week were to receive a bonus of 1% of their wage per week for each point rise in the cost-of-living index.

The administration of wages was made the particular duty of a new board, called the National War Labour board, consisting of a chairman and four members representing employers and four members representing employees, appointed by the government. Five regional boards were set up to act under the national board. The control of prices was added to the task of the Wartime Prices and Trade board. This board was established in 1939, when Canada entered the war. Both boards were given full and complete powers.

Certain special functions were given to a new body, the Price Stabilization corporation. It was made up of a chairman, Hector McKinnon, former chairman of the price board, and associates, mainly chosen from the business world, but all appointed by the government. The duties of the Stabilization board were to buy and to resell imports.

Cotton, rubber, necessary consumers' goods, the component parts of essential machinery and such like were to be bought by the Stabilization corporation and resold in Canada. The government was to absorb the loss where it occurred. It was expected that the Stabilization corporation would have to act, sooner or later, as an export agency as well.

The Price Stabilization corporation also had the power to lend, grant or otherwise provide funds for legitimate business where and when decided necessary. This power to subsidize industry is not to be confused with general subsidization of all production and distribution. It was to be used only when other means had been exhausted.



WENDELL WILLKIE was greeted tumultuously at the city hall during his visit to Toronto, Canada March 24, 1941

The policy of the price board was to compel industry to cut its suit to its cloth, including profits. While the board had no intention of allowing any essential enterprise to go to the wall in 1941 by the imposition of price control, nevertheless profits were undoubtedly to be reduced, and those who were in the best position to do so would have to make the greatest sacrifice. In other words, when the "squeeze" became too great, the Stabilization corporation was to relieve the pressure. "Moreover, the continued flow of goods is of the utmost importance, and the board will be forced to intervene if suppliers divert business abnormally to suppliers who offer to pay higher prices." Business was warned that "the board has the power to reduce prices, and will exercise that power, if necessary, where it is convinced that prices are not justified by necessary costs of operation."

The price ceiling applied to each individual store, department or branch, on the basis of its own prices for each separate kind and quality of goods and services during the basic period. The lower-price stores were not per-

mitted to raise their prices to the level of the higher-price stores.

Suppliers of goods and services were not permitted to give the consumer less value for his money by lowering quality, material, style, workmanship, size, weight or intrinsic value.

The prices of agricultural products and fish required a somewhat different method of control. In these lines the producer's maximum price was governed by the highest prices paid in recognized markets during the Sept. 15–Oct. 11 period. In certain cases minimum prices for specific commodities, such as milk, butter, cheese and eggs, might be fixed by the board.

The machinery of control through which the Wartime Prices and Trade board worked in 1941 was a licensing system. All persons in the business of buying and selling were required to have licences, and had to have one after Dec. 1. The licences were issued by the board, subject to their rules and regulations, and might be revoked by the board. In addition, definite penalties for violating the law were prescribed.

The wage plan was further widened late in Nov. 1941 to include all wage earners in the classes above mentioned, employed in any establishment irrespective of the number of employees; and all persons above the rank of foreman employed on a salary basis. In the case of the latter the salary rate was established at the amount paid previous to Nov. 7, 1941, without provision for the statutory cost of living bonus. (J. T. C.)

Education.—In Canada education is under provincial control. In Quebec the organization and finance of public education is entirely separated on religious lines as between Roman Catholics (under the Roman Catholic committee of the Council of Public Instruction) and all others, under the parallel Protestant committee. Under neither is education compulsory. In all other provinces public education is secular, under a provincial department and minister, elementary education being free and compulsory. In all provinces except Quebec secondary education is carried on in public

Table I.—*Education in Canada, 1939*

	Institutions	Pupils	Teachers	Expenditure
Provincially-controlled schools				
Ordinary and technical day schools	32,800	2,191,876	75,526	
Evening schools	452	93,340	2,500	
Correspondence courses	7	21,564	300	$130,000,000
Special schools	20	5,051	500	
Normal schools	83	6,501	689	
Privately-controlled schools				
Ordinary day schools	865	90,956	4,955

*Includes only affiliated schools that are not enumerated in "Courses of university standard."

high schools or the similar, better equipped, collegiate institutes, and in endowed private schools. In Quebec secondary education for Roman Catholics is organized under clerical control in colleges; for others (all called Protestants) in high schools and in endowed private schools. There are provincial universities at Toronto, Fredericton, N.B., Winnipeg, Saskatoon, Edmonton and Vancouver. The chief endowed universities are McGill (Montreal), Dalhousie (Halifax), Queen's (Kingston), Western (London), all of which are secular. The chief clerical institutions are the denominational colleges federated to the University of Toronto: McMaster university (Hamilton, Ont.), Baptist; Bishop's (Lennoxville, P.Q.), Anglican; Mount Allison (Sackville, N.B.), Methodist; Laval (Quebec city) and the University of Montreal, Roman Catholic. The endowed and the clerical universities, although not controlled by the provincial, receive a certain measure of provincial support.

Defense.—See *Canada at War*, above.

Finance.—The monetary unit is the gold dollar, of 2,580 gr., nine-tenths fine (23.22 gr.), as was the U.S. dollar till 1934. No gold dollars were coined except from 1908 till 1919. The British gold sovereign is unlimited legal tender at $4.86⅔ (1941). Redemption in gold was suspended in 1931. After the outbreak of war the exchange value of the Canadian dollar in and out of Canada was set by the Exchange Control board; banks bought U.S. dollars at $1.10 Canadian and British pounds at $4.43 and sold respectively at $1.11 and $4.47. Beyond Canadian control, except as regards re-entry to Canada, Canadian dollars were sold in a "free" market in New York city, closing at a discount of 14% at the end of 1941. The dominion budget for 1940–41 is shown in Table II. (*See* also EXCHANGE CONTROL AND EXCHANGE RATES.)

Table II.—*Dominion Expenditure*

Apr. 1, 1940—March 31, 1941. War, direct	$1,450,000,000
Advanced to cover British war expenditure in Canada and assumed (Dec. 1941)	900,000,000
All other expenditure	470,000,000
	$2,820,000,000
Gross debt (March 31, 1941)	$4,744,057,000
Net Debt (March 31, 1941)	$3,666,316,000

Banks.—Number of chartered banks, ten (Sept. 1941); capital and reserves $279,250,000; deposits: government $371,397,794; public in Canada $2,665,491,054; foreign $457,742,625; loans in Canada $1,242,505,257; abroad $132,153,688; call and short loans $88,689,480.

Trade and Communication.—The nature of the volume and direction of Canadian foreign trade was greatly altered by the war. In 1941 the main features were imports (war and general) from the United States and exports (chiefly food and war supplies to the United Kingdom). Trade with continental Europe (except the U.S.S.R.) was practically obliterated, as also with South America. Trans-pacific trade was greatly affected; trade with Japan fell to insignificant proportions with that to India, Burma and China greatly increased.

There were 42,565 mi. of steam railroads in Canada in 1940; in that year 21,969,871 passengers and 76,175,305 tons of freight were carried. There was a total of 497,707 mi. of highway in 1940 (114,254 mi. surfaced; and 383,453 mi. unsurfaced); motor vehicles licensed in 1940 numbered 1,500,829. Commercial air lines (1940) operated 32,508 mi. of airways and carried 137,690 revenue passengers. Telephones in 1939 numbered 1,397,272; the wire mileage of telegraphs in 1940 was 380,318. In 1940 there were 96 private and 78 public broadcasting stations; 1,345,157 private receiving sets were licensed.

Table III.—*Canadian Exports, 1941 and 1939 (10 months)*

Destination	Exports in first ten months of 1941	Exports in first ten months of 1939
United Kingdom	$548,985,000	$268,759,000
Rest of empire	177,438,000	84,010,000
United States	477,593,000	281,195,000
U. S. S. R.	1,285,000	2,000
China	6,126,000	2,441,000
Egypt	55,639,000	277,000
India and Burma	34,023,000	4,029,000
Straits Settlements	7,973,000	2,158,000
Newfoundland	22,243,000	6,660,000
Germany	.....	7,869,000
Italy	.....	2,097,000
Japan	1,501,000	24,124,000
All countries	1,308,006,000	726,741,000

Agriculture.—Statistics regarding various Canadian crops are given in Table IV.

Table IV.—*Estimated Canadian Field and Fruit Crops, 1941; Harvests of these Crops 1939 and 1940*

	1941	1940	1939
Wheat, bu.	306,459,000	551,390,000	520,623,000
Other grains (oats, barley, rye, flaxseed), bu.	500,597,000	501,825,000	504,905,000
Hay and clover, tons	12,080,000	14,070,000	13,377,000
Apples, bbl.	3,495,800	4,292,300	5,476,300
Pears, bu.	560,000	576,300	577,100
Soft fruits (plums and prunes, peaches, apricots and cherries), bu.	1,396,500	1,215,100	1,485,100
Strawberries, qt.	19,656,200	25,298,800	28,290,400
Raspberries, qt.	8,719,000	11,603,200	11,094,200
Grapes, lb.	52,555,000	52,727,200	55,595,900

Manufacturing.—The index of industrial production in Canada (1935-39=100) stood at 148 in 1941, an increase of 12% over 1940. The index of employment was 149 (1926–100), an increase of 23%.

Table V.—*Principal Products of Canada (First Ten Months of 1941)*

		Increase or decrease per cent from 1940
Coal, tons	15,748,767	+ 4
Flour, bbl. (9 months)	15,633,444	+33
Newsprint, tons	2,824,734	− 2
Steel ingots, long tons	1,971,909	+19
Pig iron, long tons	1,082,222	+13
Motor cars and trucks, number	228,573	+29

Mineral Production.—The government withheld from publication in 1941 all statistics of the production of copper, nickel, lead, zinc, aluminum and asbestos. The production of other minerals and metals is given in Table VI.

Table VI.—*Mineral Production of Canada (12 Months Ending June)*

	1941	1940	1939

Gypsum, tons	1,549,080	1,607,527	1,031,806
Petroleum, bbl.	9,000,093	8,147,204	7,415,988

(S. LEA.)

Canadian Literature.

The most important contributions to Canadian literature during 1941 were scored in fiction, with *Barometer Rising*, by Hugh Maclennan, and *As for Me and My House*, by Sinclair Ross, leading in this genre. *Highway to Valour*, by Margaret Duley, is noteworthy for its fine portrayal of Newfoundland life. *Wakefield's Course*, by Mazo de la Roche, supplements the already impressive Jalna saga. Evelyn Eaton's *Restless Are the Sails* and Alan Sullivan's *Three Came to Ville Marie* are costume novels in the romantic tradition.

A new and distinguished talent was revealed in Emily Carr's *Klee Wyck*, prose sketches dealing with the artist-author's ex-

periences among the west coast Indians. B. K. Sandwell's *The Canadian Peoples* and Watson Kirkconnell's *Twilight of Liberty* are useful additions to the literature of present-day affairs. Two juveniles deserve special mention. These are *Jory's Cove*, by Clare Bice, and *Sugar Shanty*, by Louise Richardson Rorke.

The year's poetry was disappointing, on the whole. Anne Marriott's *Calling Adventurers* was perhaps the most interesting publication, but it lacks the strength of some of her previous work. Doris Ferne's *Ebb Tide* and Molly Morant's *The Singing Gypsy* contain conventional verse of pleasing quality. Charles Bruce achieved distinction in *Personal Note*, a timely work on an inspirational theme. The appearance of a new quarterly magazine, *Contemporary Verse*, was a praiseworthy development in this field.

The governor general's awards for 1940 went to E. J. Pratt for *Brebeuf and His Brethren* (poetry), "Ringuet" (Philippe Panneton) for *Thirty Acres* (fiction) and J. F. C. Wright for *Slava Bohu* (general literature). (E. F. GL.)

Canals and Inland Waterways.

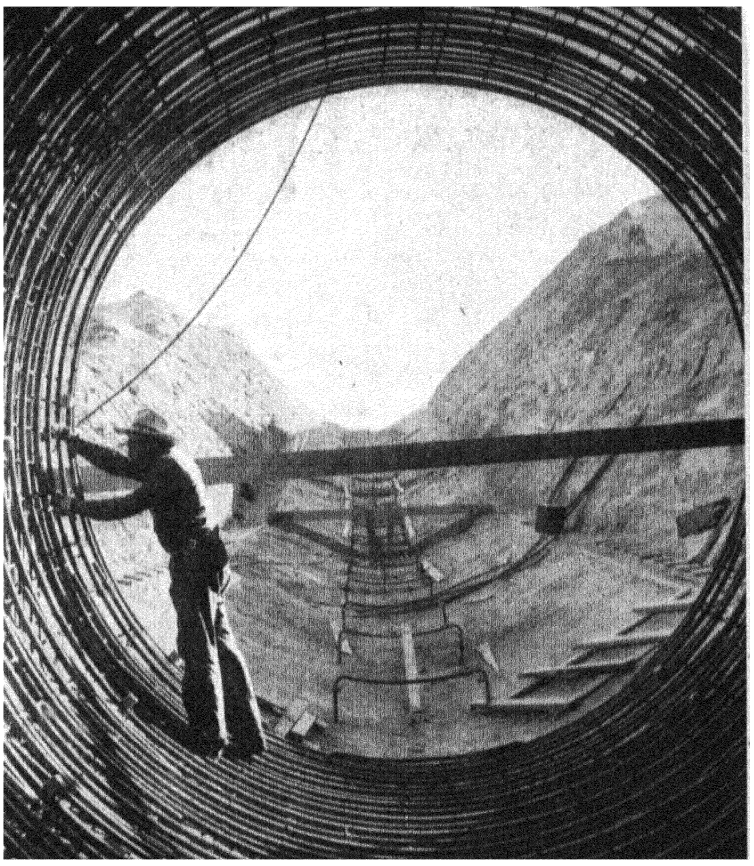
The principal inland navigable waters of the United States are the Great Lakes, the New York State canal system, the Mississippi river system, the Atlantic Intracoastal waterway, the Gulf Intracoastal waterway from St. Marks river in Florida to Corpus Christi, Tex., the San Joaquin-Sacramento system in California, and the Columbia system in the northwest. The Great Lakes have natural deep water except in the connecting channels, which have been artificially deepened where necessary to accommodate a draft of about 24 ft.; and the Welland Ship canal joining Lakes Erie and Ontario, as improved by Canada, has a permissible draft of 23·5 ft. The 12-ft. New York State Barge canal in 1941 was being deepened to 14 ft. between the Hudson river and Lake Ontario at Oswego. The Atlantic Intracoastal waterway system between Trenton, N.J. and St. Johns river, Fla., was dredged to 12-ft. project depth; and from St. Johns river to Key Largo, Fla., 63 mi. below Miami, the project depths of 8 and 7 ft. were provided.

The Cape Cod canal had been improved to provide a channel width of not less than 500 ft. and a depth of 32 ft. The Chesapeake and Delaware canal afforded a depth of 27 ft. On the gulf coast adopted projects provided for a protected intracoastal waterway not less than 9 ft. in depth between St. Marks river, Fla. and Corpus Christi, Tex., more than 1,000 mi., and this depth was in general available from Carrabelle, Fla., to Freeport Harbor, Tex. Dredging of the waterway extending southwest of Freeport was in progress. The Mississippi river had a 35-ft. depth to Baton Rouge, a 9-ft. depth from Baton Rouge to St. Louis and thence by a series of 26 locks and dams a channel of 9-ft. depth to Minneapolis, Minn. Improvement of the San Joaquin-Sacramento river system, which is connected with San Francisco bay via Suisun bay and San Pablo bay, provided a 30-ft. channel through Suisun bay to the junction of the San Joaquin and Sacramento rivers; a 30-ft. channel on the San Joaquin to Stockton, Calif., and a 10-ft. channel on the Sacramento to Sacramento, Calif., in addition to other lesser channel improvements. The Columbia river had been improved to provide a 40-ft. channel across the bar at the mouth, a 35-ft. channel to the mouth of the Willamette river (together with a 35-ft. channel up the Willamette to Portland, Ore.), a 30-ft. channel thence to Vancouver, Wash., and thence a 27-ft. channel on which work was in progress to Bonneville dam (144 mi. above the Columbia river mouth), with smaller project depths upstream.

Traffic on Major Canals and Inland Waterways of the U.S. for 1940

Waterway	Tonnage
Detroit River	111,346,567
St. Marys Falls Canal	80,360,174
Sabine-Neches Waterway	38,433,353
Mississippi River, Minneapolis to The Passes	32,372,232
Monongahela River	29,559,909
Ohio River	29,549,275
Houston Ship Channel	27,385,598
Columbia and Lower Willamette Rivers, below Vancouver and Portland	15,027,718
Louisiana-Texas Intracoastal Waterway	11,643,436
Hudson River (above Port of New York)	11,515,720
Cape Cod Canal	7,901,102
Illinois Waterway	5,729,356
New York Barge Canal	4,768,160
Kanawha River	4,490,454
Delaware River, Philadelphia to Trenton	4,410,253
Allegheny River	3,928,732
Chesapeake and Delaware Canal	3,794,990

Authority: The Corps of Engineers, U. S. Army.



CONSTRUCTING one of the three 12-ft. siphons for the Madera canal of the Central valley project, Calif., in 1941, to carry the canal across small canyons

For statistics regarding the Panama canal *see* PANAMA CANAL AND CANAL ZONE. *See* also AQUEDUCTS; RIVERS AND HARBOURS; WATER-BORNE COMMERCE OF THE UNITED STATES. (J. L. S.)

Great Britain.—Nothing much can be said about actual developments in canals and inland waterways in Great Britain during 1941. The restrictions imposed by war render it undesirable to make any definite allusion to works of navigational importance which were carried out; indeed, generally speaking, the works actually executed were of a character insufficiently important for specific localized mention, even if permissible. The catchment boards continued their policy of gradually ameliorating the river channels in their respective areas, alike for purposes of land drainage and the prevention of floods and also for navigation. Reference may be made to operations on the River Nene, as a typical example of modern river development, and it can be said that during the year 1941 the dredging of the main channel between two important towns on its banks was completed and that several of the locks along the course of the river were reconstructed and enlarged. The inverts at a number of small bridges were lowered.

The canal system of Great Britain, which had for a long time been neglected through regrettable apathy on the part of the

authorities, was lately engaging the serious attention of the government. In March 1941, Frank Pick, formerly vice-chairman of the London Passenger Transport board, was commissioned by the minister of transport "to investigate and report upon the carriage of traffic on canals and inland waterways." After an interval of a few months, the official announcement was made in September of the formation of a Central Canal committee, under the chairmanship of Colonel J. J. Llewellin, parliamentary secretary to the ministry "to advise him on questions of policy and to co-ordinate the work of the regional canal committees." Following Pick's recommendations, the six regional committees were reconstituted and strengthened "with a view to providing an effective supervisory machinery composed of those already skilled and knowledgeable in the canals and canal traffic of the region, to ensure that canals and canal facilities are worked as a unit and that their resources as a whole are used to the greatest advantage." This was a decided step forward, indicating a progressive policy for British canals, and holding out promise for their future care and development.

Europe.—On the continent of Europe, nearly everything was lost in the fog of war. Outstanding canal and river development programs which it is known were actively in progress, principally in Germany and Russia, were enveloped in obscurity; it was impossible to glean particulars respecting their progress. Germany and all axis countries naturally withheld all information on the subject and, as regards Russia, it can only be said that various sections of a comprehensive national scheme of waterway development, set out in successive "Five Year Plans" made a certain amount of headway, though progress would have been checked and, in all probability, completely suspended after the invasion of soviet territory by the German forces in June. Indeed, the general devastation wrought all along the battle front must inevitably have included the destruction of much previously completed work in the shape of locks, weirs, bridges and embankments. (B. Cu.)

Canal Zone: *see* Panama Canal and Canal Zone.

Cancer. A study of the relationship between chemical configuration and carcinogenic capacity formed an important portion of the cancer research during 1941. Only one new phenanthrene compound was described which was carcinogenic and yet contained a considerable addition of new radicles to the phenanthrene structure. In general, the addition of substances in various positions of the benzene rings of the known carcinogenics, like dibenzanthracene and methyl cholanthrene, so as to increase the size of the molecule, have not increased, but rather diminished, the carcinogenic activity. Very curiously it has been found that the complex synthetic hormone, stilbestrol, which hitherto has been studied because it had the same capacities in inciting heat in animals or in replacing theelin in human females, has in addition the same relationship as theelin to the appearance of adeno-carcinoma of the breast in male mice of a strain in which the females develop cancer. Stilbestrol given to male mice in large quantities also produces a diffuse hyperplasia of the interstitial cells of the testicle, and about a year after large quantities of the substance had been implanted under the skin in the form of tablets, testicular tumours may appear in a considerable number of the animals. These tumours resemble the interstitial cell growths of the testicle rather than the complex teratoid tumours produced in chickens by the injection of zinc chloride.

The influence of nursing on the production of breast cancer in mice is very peculiar. If a non-cancerous strain of mice is employed, and if these mice are nursed by a strain with a high rate of spontaneous cancer, the stilbestrol pellets induce a certain number of cancers. This effect of foster nursing is most striking when the mice from a strain resistant to cancer were transferred to a high cancer strain a very few days after birth. When older, the cancer-producing effect is not noticeable. Why the transfer of milk from a mouse not having a cancer should render the recipient more likely to have a cancer than if nursed by its own mother is absolutely baffling. The latest suggestion was that a virus may be transferred in the milk.

The tumours originally produced by the synthetic carcinogenic substances discovered by Kennaway and Cook were chiefly in the skin and connective tissues of mice and rats. The tumours did not differ greatly from the growths occurring spontaneously in these sites, with the exception of the fact that a considerable proportion containing actively growing muscle fibres were observed. Such rhabdo-myo-sarcoma are very rare in human beings. Up to Jan. 1, 1942, however, practically all of the human types of malignant neoplasms were produced in the various organs of these two experimental animals. Tumours were being produced also in fair quantity in guinea-pigs and rabbits, but there was no record of neoplasms appearing after the injection of carcinogenic substances in larger mammals, probably due to the fact that sufficient time had not elapsed for the cellular mutation to take place.

Chemical studies centred around tissue extracts. Schabad showed that extract of human lung from persons both with and without cancer is capable of inciting the growth of a few malignant tumours in animals, but the nature of this carcinogenic substance remains unknown.

The attention of cancer investigators turned to the effects of the vitamins and hormones, and it was shown that large quantities of calcium pantothenic acid caused marked stimulation of the growth of tumours in mice, and when an extreme deficiency of pantothenic acid was produced by suitable feeding, the tumours slowed down in their progress, but to obtain such an effect, the deficiency condition had to be so complete that many of the animals died, so that the production of a deficiency of this substance cannot be considered as a promising form of treatment.

In this same field also West and Woglom showed that the biotin content (vitamin H) of tumour cells is considerably higher than that of the corresponding normal tissues, in this regard resembling the embryo. The one exception was liver carcinomas produced in rats by feeding butter yellow. Laurence suggested that some of the so-called spontaneous recessions of malignant tumours in man may be explained by a biotin deficiency, but experiments along this line have not confirmed this theory.

When it was observed that the alkaloid, colchicine, exerted an extraordinary stimulating effect on the division of cells in various normal tissues, it was hoped that by the injection of this substance a great increase in cell division in tumours might be induced, for the general opinion has been that the more dividing cells in a tumour, the more sensitive that tumour would be to radiation, because radiation affects primarily the chromosomes of the dividing cells. The results, however, have been very disappointing, as the dose of colchicine required to produce a very slight effect on a tumour, when combined with radiation, is so large as to produce severe toxic effects in the patient.

A study of the effects of the injection into the circulating blood of artificially radioactive compounds, chiefly radioactive phosphorus, continued. The procedure seems to have little influence on the growth of tumours, but as was shown many years ago, using thorium X or other natural radioactive products, considerable benefit may occasionally be produced in the chronic leucaemias, especially of the myeloid type. On the other hand, as the older experiments showed and unfortunately experiences since

have emphasized, there is a not inconsiderable danger in the administration of these products, so that it is well that their administration be confined to those who have had wide experience with such a form of treatment, and that there be no general distribution to the medical profession of such highly dangerous products.

Leucaemia and allied diseases were still well treated by X-ray, of which the effective technique is well known, and it would be wise not to make too rapid a change in the general treatment of these diseases and abandon the old before the new has been thoroughly tested at competent hands.

Experiments with neutron beams were also being carried out under skilled auspices, but no extraordinary effectiveness in the cure of cancer was observed. In fact, it is much more likely that good results in the treatment of cancer in the future will be more promptly obtained by the careful study of the types of the tumours treated and the details of the technique than from any new developments in the use of the various types of charged, or, as in the case of neutrons, of uncharged particles. (*See* also ALIMENTARY SYSTEM, DISORDERS OF; MEDICINE.) (F. C. W.)

Candler, Warren Akin (1857–1941), U.S. churchman, was born Aug. 23 in Villa Rica, Ga. After graduating from Emory college he became a circuit preacher. He was president of Emory college, 1888–98, and became a bishop in the Methodist Episcopal Church, South, in 1898. Bishop Candler strongly opposed the movement that led to the union of the northern and southern Methodist churches, and in 1928 he refused to join Southern Methodist churchmen who openly fought the candidacy of Al Smith for president, declaring that the church should stay out of politics. He helped found Emory university, with the aid of a $1,000,000 endowment he secured from his brother, Asa, founder of the Coca-Cola company, and had the institution moved from Oxford to Atlanta, Ga. Bishop Candler died in Atlanta, Sept. 25.

Candy. The confectionery industry in 1941 enjoyed one of the best years in its history both from the point of view of sales and general stability. With the continuance of the war, however, the outlook did not loom as bright.

Because of improved general conditions, candy production in 1941 was 25% greater than the 2,000,000,000-lb. level reached in 1939. The sales increase in 1941 over 1940 was 18%, compared with an increase of 7% in 1940 over 1939 business. The 1941 tonnage of 2,500,000,000 lb. of candy was produced by 1,100 plants (about 100 less than in 1940), employing more than 50,000 people. Wholesale sales in 1941 amounted to about $350,000,000, with retail sales amounting to $700,000,000. Forty manufacturers reported sales of $1,000,000 or over, 65 manufacturers were responsible for 60% of the volume while less than 200 manufacturers produced 60% of the industry's tonnage.

The average value per pound of candy in 1941 was 19 cents as compared with 16 cents in 1940. Per capita consumption in the United States was slightly above 19 lb., which means that the average American consumer bought about $5 worth of candy in 1941. Manufacturers increased their prices but not sufficiently high to compensate for increased costs.

Candy is largely a "penny business," with the bulk of volume sold in one-cent units. During 1941, however, the number of penny as well as five-cent items (the second most important unit of sale) on the market showed a decline as compared with 1940. Moreover, larger increases were reported on higher-priced candy than on one-cent or five-cent items. The trend continued sharply toward higher-priced candies.

Candy manufacturers were feeling the impact of the war. All sugar stocks were frozen by an OPM order early in December. This means that manufacturers may not receive delivery of sugar beyond 30-day requirements and may not use stock on hand beyond 60-day requirements. Sugar is one of the three most important ingredients used in the manufacture of candy. The other two are corn syrup (glucose) and chocolate. The order freezing sugar stocks did not apply to corn syrup, with the result that formulae changes would be affected, calling for greater use of corn syrup and less of cane and beet sugar (sucrose). A price ceiling was placed on sugar but not on corn syrup and cocoa. The use of foil and cellophane was drastically curtailed. Instead of foil, the popular chocolate bars were packed in parchment, glassine and other substitute wrapping material. But even these packaging as well as shipping materials were difficult to obtain. The supply of some ingredients, notably almonds and coco-nut, dwindled. There was about a year's supply of cocoa and chocolate on hand by the end of 1941, while certain essential oils and flavouring materials became increasingly difficult to obtain. There was practically a complete halt in the exportation and importation of candy in 1941. (H. D. G.)

Cane Sugar: *see* SUGAR.

Canning Industry. U.S. and territorial canned food production in 1941 totalled about 470,000,000 cases, compared with about 375,000,000 cases in 1940 and about 316,000,000 cases in 1939. Production of canned foods since 1930 increased much faster than the population but the large increase in production of canned foods during 1941 was to provide for the requirements of the armed forces in the United States, together with the large quantities shipped to Great Britain and other countries under the lend-lease program.

The greatest increases in quantities of canned foods for the defense program were canned milk, from 58,000,000 cases in 1940 to 75,000,000 cases in 1941, canned meat from less than 15,000,000

THE NEED of the expanding U.S. army for greater quantities of canned food was pointed out by Lieut. Col. Paul P. Logan at the 1941 annual canners' convention in Chicago

cases in 1940 to 25,000,000 cases in 1941, and canned vegetables from 204,000,000 cases in 1940 to 260,000,000 cases in 1941. There were increases also in the packs of fish, fruits and fruit juices.

Substantial increases in canned food production in 1941 brought about parallel increases in the consumption of materials such as tin-plate, fibreboard boxes, and ingredients such as sugar which go into the manufacture and distribution of these foods. In 1940 about 28,000,000 base boxes of tin-plate were used, which increased in 1941 to about 35,000,000 base boxes.

National Defense.—In providing for the expanding needs for subsistence of the armed forces and nations benefiting under the lend-lease program, it seemed that still greater demands would be made upon the canning industry in 1942. The industry was, therefore, aligning itself in the direction of maximum production.

Research.—Research in 1941 had the objective of quality maintenance under conditions of expanded production. Investigations were made to determine the practicability of methods intended to conserve tin. Such research would be continued in 1942. (E. J. C.)

Cannon, Annie Jump (1863–1941), U.S. astronomer, was born Dec. 11, in Dover, Del. The most famous woman astronomer of her time, Miss Cannon was the first woman to receive an honorary doctor's degree from Oxford university, the first woman officer of the American Astronomical society, and one of the few honorary members of the Royal Astronomical society of London. In 1931 she won the Henry Draper medal of the National Academy of Sciences for her catalogue of 225,000 stellar spectra. She joined the Harvard faculty in 1897 and in 1911 she was appointed curator of astronomical photographs. In 1938 she was named William Cranch Bond astronomer, a post established in honour of the founder of the college observatory. Although she retired from Harvard observatory in Sept. 1940, she continued her work at the Harvard observatory on a special astronomical mission from Yale. She died in Cambridge, Mass., April 13. (See *Encyclopædia Britannica.*)

Canton Island: *see* SOUTH SEA AND EQUATORIAL ISLANDS.

Caperton, William Banks (1855–1941), U.S. naval officer, was born June 30 in Spring Hill, Tenn. He was graduated from the naval academy in 1875, became an ensign in 1877 and was promoted through the grades to admiral in 1916, retiring three years later. In the Spanish-American War he was executive officer aboard the "Marietta," which raced from the Pacific to the Atlantic to engage in the fight against Adm. Cervera's fleet. Disregarding seniority, President Wilson named him admiral and commander-in-chief of the Pacific fleet in 1916 in recognition of his skill in handling the West Indies uprisings in 1915 and 1916. During World War I he co-operated with the French and British navies and cleared the South Atlantic of German raiders. Adm. Caperton died at the naval hospital in Newport, R.I., Dec. 21.

Carnegie Trusts. Carnegie Corporation of New York, established by Andrew Carnegie in 1911 and endowed with $135,000,000, expends its annual income in grants to institutions and agencies whose activities aim at the advancement and diffusion of knowledge and understanding among the people of the United States and of the British dominions and colonies. Frederick P. Keppel, president since 1922, retired and was succeeded by Walter A. Jessup, who will be president of both the corporation and the foundation.

During 1940–41, the corporation trustees appropriated a total of $2,706,834: library interests, $398,511; adult education, $566,930; fine arts and museums, $285,452; research and publication, $906,956; general educational purposes in schools, colleges, universities, etc., $548,985. The amount appropriated since 1911 totals $184,430,549.

The five other separately administered Carnegie organizations in the United States, which were founded by Mr. Carnegie for specific purposes before the establishment of the corporation, with endowments ranging in 1941 from $10,000,000 to $30,000,000, followed their established programs described regularly in their annual publications.

Carnegie Institute of Pittsburgh (1896), which comprises an institute of technology, a museum of fine arts, a music hall, a museum of natural history, a public library and a library school, carried out its normal programs.

Carnegie Institution of Washington (1902), devoted to scientific research, has expended since its organization $45,558,556 in its program of encouraging investigation, research and discovery, and the application of knowledge to the improvement of mankind, specifically by work in astronomy (Mt. Wilson observatory), terrestrial magnetism, geophysics, animal and plant biology, and historical research (especially in Yucatan). Many of its staff and a large part of its research faculties were engaged in services relating to the national emergency.

Carnegie Hero Fund Commission (1904), established to recognize heroic acts performed in the United States of America, the Dominion of Canada, the Colony of Newfoundland, and the waters thereof by persons the nature of whose duties in following their regular vocations does not necessarily require them to perform such acts, announced that the list of its beneficiary aid shows a total of 3,180 recipients of medals and 306 persons receiving pensions. During the 1940–41 fiscal year, 38 persons received educational awards and 38 others received pecuniary awards for specific purposes. Its awards for the year 1940 totalled $147,637.74.

Carnegie Foundation for the Advancement of Teaching (1905), established to provide retiring pensions for teachers and to advance higher education, paid $1,929,443.13 in retiring allowances to retired college professors, or their widows, making a total of $40,569,056.18 paid for such purposes since its establishment. It has also continued, chiefly from funds provided by the corporation, its program of educational research, including such activities as teacher-testing program, graduate examination study, etc.

Carnegie Endowment for International Peace (1910), established to serve the purpose indicated by its name, expended $625,650 in its efforts to further friendly understanding among the nations of the world. The study of Canadian-American relations, the findings of which are being reported in 44 volumes, published chiefly by Yale university, Ryerson and Oxford presses, was terminated. This activity was made possible by corporation grants to the endowment. (R. M. LE.)

Carol II (1893–), king of Rumania from 1930 to 1940, was the eldest son of King Ferdinand and Queen Marie. For his earlier career, see *Encyclopædia Britannica.*

After the partition of Rumania in the summer of 1940, Carol vacated the throne in favour of his son Mihai on Sept. 6. Fleeing the country with his friend Magda Lupescu, he barely escaped assassination when his train was fired upon by Iron Guardists at the Yugoslav border. He travelled to Switzerland, then to Se-

RUMANIA'S EXILED KING CAROL II and his companion, Magda Lupescu, as they arrived in Bermuda May 10, 1941 from Portugal

ville, Spain. Meanwhile the new Rumanian government had conducted inquiries into his royal income and threatened to ask his extradition from Spain. The Spanish government placed Carol and Lupescu under guard but did not return them to Bucharest. On March 3, 1941 Carol and Lupescu eluded a Spanish police guard and crossed the border into Portugal. They sailed for Bermuda in May, toured the West Indies and Cuba, then took up their residence in a suburb of Mexico City in July. There, on Jan. 7, 1942, Carol announced that he would proclaim himself regent of Rumania (because his son ruled under the duress of German occupation) and leader of the forces of a Free Rumania.

Catholic Library Association.

The Catholic Library association was organized in 1921 as the library section of the National Catholic Educational association; in 1931 it became an independent body and in 1936 was incorporated. Membership at the end of 1941 was approximately 700.

The purpose of the organization is to initiate and encourage movements for the progress of Catholic library work and Catholic literature. During the decade 1931–41 it centred its attention on (a) bibliographical guides to contemporary Catholic literature; (b) a classification schedule and rules for cataloguing practice in Catholic libraries; and (c) fostering interest in professional library training among the personnel of Catholic libraries. Promotion of an annual National Catholic Book week is a development in the field of publicizing Catholic literature. To encourage gifts of Catholic books for the many Catholics in the military service, the C.L.A. was co-operating in the 1942 Victory Book campaign.

A series of regional units covers the greater part of the United States. Unit meetings give frequent opportunity for personal contact between members and for direct presentation of policies of the association; of late, these groups have constituted the chief element in training leaders for the national association and in increasing its membership.

Activities in 1941 were carried on or supervised by the following committees: Cataloguing and classification, canonical aspects of books and reading, *Catholic Periodical Index*, committees and special projects, constitution and by-laws, co-operative indexing, defense activities, elections, hospital libraries, library service to Catholic readers, books for high school libraries, membership, National Catholic Book week, publications, publicity and statistical forms. General control of association affairs was in the hands of the advisory board, executive council, president, vice-president and secretary-treasurer. Officers for the term 1941–43 were: Rev. Thomas J. Shanahan, St. Paul seminary, St. Paul, Minn., president; Rev. Andrew L. Bouwhuis, S.J., Canisius college library, Buffalo, N.Y., vice-president; Eugene P. Willging, University of Scranton, Scranton, Pa., secretary-treasurer. Official headquarters of the C.L.A. are at the office of the secretary-treasurer.

Publications.—The *Catholic Periodical Index* is the principal publishing effort of the association; it is a current cumulative author-and-subject guide to contents of more than 50 Catholic magazines. A *Reading List for Catholics* (1940) and a *Supplement* (1941) were issued in connection with the National Catholic Book week and contain recent Catholic books recommended for the general reader. *An Alternative Classification for Catholic Books* (1937), by Jeannette Murphy Lynn, is a scheme for shelf arrangement of theology, canon law and church history to suit the needs of the Catholic library. It may be used to supplement either the library of congress or Dewey standard classifications. Shorter reading lists on special subjects and the bibliographical pamphlet series, *Contemporary Catholic Authors*, are issued several times a year. The official organ is the *Catholic Library World* (1929–). Published monthly from October to May, it contains bibliographical and technical articles and annotated lists of new Catholic books and pamphlets. (T. J. S.)

Catholic Rural Life Conference, National.

Founded in 1923 for the purpose of preserving and promoting sound rural life for and among Catholics, the conference specifies its working aims as: (1) to care for the underprivileged Catholics living on the land; (2) to keep on the land Catholics who are now on the land; (3) to settle more Catholics on the land; (4) to convert the non-Catholics on the land. In general, it is dedicated to the achievement of economic-social-spiritual security for rural America.

The 19th annual convention was held at Jefferson City, Mo., Oct. 4–8. About 6,000 attended the sessions, including 14 bishops, more than 300 priests, professors, rural-life directors, farm leaders, farmers, students, etc. Delegates were present from 40 states. The convention theme was: "What Helps Rural Life Helps the Church and the Nation." Resolutions were passed favouring small ownerships of land and condemning large landownerships, share cropping and short-term leases, one-crop systems and the robbing of soil fertility. Stress was laid on the spiritual vigour of the family unit, on social charity in the community, and on the extension of credit unions, co-operative stores, markets, industries, etc. Attention was paid to rural schools, 4-H clubs, folk games and recreation, effective health-service. Discussion centred also on a program for rebuilding families and for vital space, rebuilding communities in the social reconstruction after the war.

The activities of the conference include vacation schools for children, summer schools for priests and directors, correspondence schools, lecture and library service, information centres, rural, economic and sociological research.

The Most Rev. Aloysius J. Muench, bishop of Fargo, N.D., was elected president. Rt. Rev. L. G. Ligutti was reappointed executive secretary. The official publication is the *Catholic Rural Life Bulletin*. Headquarters in 1941 were: 525 Sixth ave., Des Moines, Ia. (F. X. T.)

Catholic Welfare Conference, National.

Erected under the authority of the bishops of the United States, in 1919, the conference functions as their agency in the United States. It unifies and co-ordinates Catholic effort in the United States in spheres involving the welfare of the church and the nation.

The 23rd annual session of the hierarchy, held at the Catholic university, Washington, D.C., was attended by Dennis Cardinal Dougherty, archbishop of Philadelphia, who presided, and by 15 archbishops and 95 bishops. The officers elected to the administrative board of the N.C.W.C. were: chairman, Most Rev. Edward Mooney, archbishop of Detroit, Mich.; vice-chairman and treasurer, Most Rev. Samuel A. Stritch, archbishop of Chicago, Ill.; secretary, Most Rev. Francis J. Spellman, archbishop of New York, N.Y. The Rt. Rev. Michael J. Ready was again appointed general secretary.

The administrative board issued a statement, "The Crisis of Christianity," dealing with the problems incident to the national and international situation. Plans were outlined for the celebration, May 13, 1942, of the 25th anniversary of the episcopal consecration of Pope Pius XII. A committee of bishops was appointed to promote the wider knowledge of the peace points of the pope.

Episcopal chairmen, members of the administrative board, were appointed to the eight departments.

Gleanings from the reports submitted for 1941 indicate the scope of the conference. *Executive.*—Archbishop Mooney, Detroit, Mich., chairman. Concerned with the status of priests, religious and theological students under the Selective Service act. Efforts were made to safeguard the spiritual and religious welfare of service men and defense workers through the promotion of the National Catholic Community service, a member agency of the United Service organizations. The N.C.C.S. had set up, or planned, a total of 113 service clubs and centres. The bureau of immigration was called upon to settle an unprecedented number of cases, caused by the shifting of war conditions. *Education.*—Archbishop McNicholas, Cincinnati, O., succeeded Bishop Peterson, Manchester, N.H., as chairman. Concerned itself with the impact of the national program for defense and war needs, with the problems of inter-American relations, and with the development of vocational and visual education. *Catholic Action Study.*—Archbishop Murray, St. Paul, Minn., chairman. Continued survey and research regarding programs and achievements at home and abroad. *Social Action.*—Bishop E. V. O'Hara, Kansas City, Mo., chairman. Made special efforts to equip priests to promote social education and action, to increase the number of speakers capable of addressing congresses and group meetings, and to participate in conferences between labour and management. *Press.*—Bishop Gannon, Erie, Pa., chairman. The N.C.W.C. news service, covering all Catholic news, increased circulation to 484 subscribing publications in 31 countries. A Spanish news service for Latin America, *Noticias Catolicas*, begun in May, was taken by 40 papers, many of them dailies. *Lay Organizations.*—Bishop Noll, Fort Wayne, Ind., succeeded Bishop Kelley, Oklahoma City and Tulsa, Okla., as chairman. "The Catholic Hour," weekly broadcast sponsored by the National Council of Catholic Men, was heard over more than 90 stations, and drew 224,908 responses from listeners. The National Council of Catholic Women, organized in 65 dioceses, having 3,469 local branches, engaged in various forms of Catholic action. Its school of social service graduated its largest class, numbering 27. *Legal.*—Bishop Boyle, Pittsburgh, Pa., chairman. Dealt with problems of Catholic institutions as regards construction, supplies, etc., under defense and war program. *Youth.*—Bishop Duffy, Buffalo, N.Y., chairman. Facilitated exchange of information on youth work and acted as federating agency for Catholic youth groups.

Committees, each headed by a bishop, directed the Confraternity of Christian Doctrine, Motion Picture Legion of Decency, Catholic relief and refugee work, Catholic missions, Decent Literature organization, Mexican seminary.

National offices are located at the Catholic university, Washington, D.C. The N.C.W.C. issues a monthly publication, *Catholic Action*. (F. X. T.)

Catholic Youth Organization.

The Catholic Youth organization (CYO) was established in Chicago in 1930. Its founder was Bishop Bernard J. Sheil, auxiliary bishop and vicar-general to Cardinal Mundelein. At the time of its founding in the beginning of the eco-

nomic depression of 1929, the CYO's primary objective—an objective that still remained fundamental despite the broader social-conscious complexion of the CYO program of later years—was to promote among Catholic youth a recreational and religious program that would adequately meet the physical and spiritual needs of out-of-school Catholic boys and girls.

Indirectly, a corollary aim was to help decrease the crime and delinquency among the polyglot youthful populations of Chicago's industrial areas, which were among the first to suffer from the depression.

To a great degree the Catholic Youth organization, in Chicago as well as in other parts of the country where the general idea was quickly adopted, fulfilled its original aims, and tens of thousands of young Catholics chiefly out-of-school were in 1941 participating in extensive and well-organized recreational activities under the supervision of their parish priests. As a result of the widespread acceptance of the CYO idea and the rapid establishment of similar groups in scores of towns and cities throughout the United States and even in Canada, the influence exerted by the CYO was nation-wide. Even Hawaii established a Catholic Youth organization patterned after the Chicago CYO.

Historically, the effort to provide Catholic youth with an interesting and wholesome program of constructive recreation, whether physical, social, spiritual or intellectual, established a precedent in Catholic circles. The Catholic Church in 1930 reached an agreement with the Boy Scouts of America providing for the establishment of a scouting program for the 5,000,000 Catholic boys and girls of the country. Stemming from a purely democratic ideal, the CYO was dedicated to the principle that boys and girls recognize no religious or ideological cause that fails to be rooted in Christian democratic heritage. Its conception of youth at work and at play, widely disseminated through the press and over the radio, helped to dramatize the cause of U.S. youth during the decade 1930–1940 as perhaps nothing else did. Among the institutions maintained by the Chicago CYO as of 1941 for the benefit of its youthful members were the CYO-Lewis School of Aeronautics, the CYO West Side Community centre, the CYO hotels for youthful parolees and transients and the CYO Working Boys' home. Of the numerous recreational activities sponsored by the CYO, the most interesting perhaps are classes in radio technique and radio dramatics, study clubs for social action, gliding, boxing, speed ice skating, baseball, softball, outdoor camps for needy youngsters and vacation schools during the summer months. (B. J. S.)

Cattle. The number of cattle and calves on United States farms at the end of 1941 was estimated by the department of agriculture as about 2,000,000 more than the 71,666,000 head on farms at the end of 1940.

Cattle increased after 1938 and began the year 1942 close to the peak of 1934. Slaughter of cattle in 1941 was 10,945,906 head, and 9,756,130 head in 1940, with a five-year (1936–40) average annual slaughter of 10,003,921 head. Slaughter of calves in 1941 was 5,561,042 head, compared with 5,358,695 in 1940 and a five-year average of 5,693,055. The foregoing figures apply to packing plants under federal inspection. The general level of cattle prices averaged about $1 higher in 1941 than in 1940. Choice grade slaughter steers were lower during the last four months of 1941 than in 1940, but through most of the year lower grades of slaughter steers and feeder cattle were higher. The number of cattle on feed Jan. 1 was approximately the same in 1941 and 1940. The 1942 goals of increased production of most agricultural products, as requested by the United States department of agriculture, did not call for any increase in the number of cattle. Instead, it recommended that slaughter of cattle be increased about 12% in 1942 over 1941. This increase in beef production can be achieved without decreasing the numbers of breeding stock. The need for increased meat production in defense activity is large, and the economic position of the cattle industry would be improved if the increasing numbers of cattle were checked The United States' trade agreement with Argentina held particular interest to the cattle industry. Under the tariff of 1930, imports of canned, pickled or cured beef paid a duty of 6 cents per lb., but not less than 20% ad valorem. The agreement changed the 6 cent duty to 3 cents, but retained the 20% ad valorem provision. Production of canned beef in the United States is small, and the domestic demand has been met to a considerable extent by imports from Argentina, Brazil, Uruguay and Paraguay. During the six years ending in 1940 these imports ran from 61,000,000 to 88,000,000 lb. annually. Imports of cattle and calves from Canada during the first nine months of 1941 were 177,000 head, approximately the same as in the first nine months of 1940. Imports from Mexico for the corresponding periods were 384,000 head in 1941 and 301,000 head in 1940. The increase in imports was represented chiefly by lightweight stockers and feeders on which an import duty of 2.5 cents per lb. was paid. Slaughter of beef cattle in Argentina and Uruguay increased 9% the first eight months in 1941, and exports from those countries and Brazil again moved upward for the first time since the fall of France in 1940. Argentina, the leading beef-exporting country of the world, has soil and climate conditions that provide for the most economical production of cattle. (*See* also MEAT.)

Cellulose Products. Emergency and blockade conditions in 1941 created unbalance in the production and application of cellulose products. In Canada and the United States an increased demand for paper, both for domestic use and for export to Great Britain and Latin America, speeded up production of wood pulp to capacity. Augmented production of nitro-cellulose explosives, as well as of rayon, dopes, films and plastics, increased the demand for cotton linters as a source of chemical cellulose.

Contrasted with this, but resulting from the same conditions, was the growing use of wood as a substitute material in Sweden for products no longer obtainable by import; several layers of water-impermeable corrugated board served as insulation in refrigerators in place of cork. Tablecloths, handkerchiefs and even ambulance materials were being made of paper in Sweden to save textiles and soap. In Great Britain the use of paper was prohibited for tablecloths, facial tissues, paper cups, etc., while in the United States many thousands of dollars' worth of paper cups were ordered for army use. Related difficulties in the paper industry arose from priorities in the United States of chemicals such as chlorine, caustic soda and formaldehyde, needed for defense purposes and also for export, particularly in view of heavy demands for chemicals in Russia, while Norway was faced with the problem of finding substitutes for rosin size and alum. Sodium silicate and glue were used in part to replace rosin but no satisfactory substitute for alum was found. In line with the conservation of materials, a general policy was to collect and save waste paper; new methods for de-inking continued to be patented. Economy was also practiced in the greater recovery of by-products, such as calcium lignin sulphate from sulphite liquor.

In the United States it was proved experimentally that considerable quantities of low-cost hardwoods could be used in the manufacture of newsprint. In Germany a method for preparing cellulose from the outer layers of cornstalks was found to be easier than its preparation from wood; potato tops mixed with straw proved suitable for the manufacture of coated paper. In India some grades of rice straw yielded 44% of paper pulp. Biological pretreatment of elephant grass and waste from harvested banana plants made possible an increased yield of cellulose. Alginic acid obtained from seaweed abundant along the shores of Scotland and Ireland was made into rayon with the same machinery used for viscose rayon, at a considerably lower cost.

By a new process which should prove of particular value in China, pulp was produced from bamboo, satisfactory for the same purposes as sulphite pulp from wood. The bamboo is treated with an aqueous salt solution such as that of sodium xylenesulphonate, this liquor being recovered and repeatedly re-used. A chemical suitable for bleaching wood pulp, cotton, viscose rayon, acetate rayon, straw, jute and hemp is sodium chlorite, $NaClO_2$. This is a strong enough oxidizing agent to destroy colouring matter but, unlike hypochlorite, is not strong enough to damage fibres.

Increased use of cellulose products was noted in the replacing of metal foil in the food industry by glassine paper; also of silk in the hosiery industry by rayon yarn. (*See* also PAPER AND PULP INDUSTRY; PLASTICS INDUSTRY; RAYON.)

Cement. New building construction for the defense program was responsible for a greatly increased demand for cement, and led to marked increases in output, especially so in 1941.

Production of all types of cement in the U.S. in 1940 increased 6% over 1939, to 132,751,100 bbl., while shipments were 132,864,400 bbl. and apparent consumption 131,734,800 bbl. Early in 1941 the increase became so much more pronounced that production of portland cement alone, which accounts for about 98% of the total, was 135,241,000 bbl. in the first ten months of the year, or more than in the full year of 1940. This should bring the total for 1941 to about 170,000,000 bbl., and shipments for the year would approximate 176,000,000 bbl., to each of which figures is to be added about 3,000,000 bbl. of special types of cement, giving a grand total which might establish a new record high in shipments, replacing the 178,507,000 bbl. in 1928. With shipments increasing faster than output, and in the lead since the end of the first quarter, there was a corresponding decrease in stocks, which at the end of October had dwindled to less than the shipments made in any month since April, instead of the usual equivalent of three months' supply. Imports were reduced well below the former level of 2,000,000 bbl., and exports were increased by demand from countries cut off from European shipments, resulting in net exports of more than 1,000,000 bbl. in 1940, as against a normal net import. Census, 1940. The sixteenth decennial census of the United States was taken as of April 1, 1940. The enumeration was largely completed during the months of April and May, though additional field work was done in scattered areas

all through the summer and into the early fall. The first, and in one sense the most fundamental, process in the utilization of the census returns is the count of the population. This serves as a basis for the apportionment of representation in congress and must be completed by the first of December of the census year. From this count are obtained figures representing the total population of every geographic area recognized by the census, ranging from states, cities and counties down through townships, to the very smallest incorporated villages. The second major process through which the census returns must go is the coding of the schedules and the punching of the cards for machine tabulation. The third process is the actual tabulation of these cards and the preparation of the results for publication. In the tables following are presented some of the results of the first series of tabulations of the 1940 population cards, these figures being summaries for the United States of tabulations made in most cases for about 18,000 areas, comprising all urban places, the rural-farm and rural-nonfarm parts of all counties and various subdivisions of the larger cities.

Urban and Rural Areas.—The urban population comprises in general all persons living in incorporated places (cities, towns, villages or boroughs) having a population of 2,500 or more, while the rural population is made up of persons living outside such places. The rural population is further subdivided into farm and nonfarm, the rural-farm population comprising all persons living on farms in rural territory, without regard to occupation, and the rural-nonfarm comprising the remainder of the rural population.

The urban and rural areas may be further subdivided so as to separate the larger cities from the smaller, and the rural incorporated places from the unincorporated territory. Figures showing such a distribution for 1940 and 1930 are in Table I.

There were 3,464 urban places in the United States in 1940, as compared with 3,165 in 1930. These were mainly incorporated places of 2,500 or more, with a few unincorporated areas (townships, etc.) that were classified as urban on the basis of special qualifications such as extreme density of population. The increase in the number of urban places is the net result of the addition of 344 new places in the 1940 data and the dropping of 45 places from the 1930 list. Most of the 344 new urban places were incorporated places that attained a population of 2,500 or more during the decade and thus qualified as urban, but 20 of them were places not incorporated until after 1930. Of the 45 places taken off the urban list most were dropped because of decreases to below the 2,500 limit, but a few disappeared through annexation to other urban places or disincorporation.

The urban-rural distribution of the population did not change materially between 1930 and 1940, the percentage urban having increased only from 56·2 in 1930 to 56·5 in 1940. There were appreciable changes, however, in the farm and nonfarm subdivisions of the rural area. The rural-nonfarm population increased 14·2% (or much more rapidly than even the urban) during the decade ending in 1940, while the rural-farm population increased only 0·2%, as a result of which the percentage rural-nonfarm increased from 19·3 in 1930 to 20·5 in 1940 and, conversely, the percentage rural-farm decreased from 24·6 in 1930 to 22·9 in 1940.

Apportionment.—The law under which the representation of the various states in the house of representatives is reapportioned on the basis of each succeeding decennial census was amended in an act of congress approved Nov. 15, 1941, to the effect that future reapportionments are to be made by the method

Table III.—*Population by Race for the United States, 1940 and 1930, and for the North, South and West, 1940*

(The figures for white population in 1930 have been revised to include Mexicans, who were classified with "Other Races" in the 1930 census reports)

of equal proportions, this being one of two alternative methods under the law as it previously stood (the other method being that of major fractions). The method of equal proportions is one under which, after each state is assured of one representative, the additional representatives are so assigned that the average population per representative shows the least possible variation as between one state and another.

Under this method California gains three representatives and six other states, namely, Arizona, Florida, New Mexico, North Carolina, Oregon and Tennessee each gains one. To balance these gains, since the number of representatives in the house is not to be changed, the following nine states each loses one representative, namely, Illinois, Indiana, Iowa, Kansas, Massachusetts, Nebraska, Ohio, Oklahoma and Pennsylvania. The complete apportionment is shown in Table II.

Race and Nativity.—The white population formed practically the same percentage of the total population in 1940 as in 1930, the percentage being 89·8 in both years and the rate of increase for the white population being the same (to the nearest tenth of one percent), namely, 7·2. The native white population taken alone, however, increased by 10.9%, while the foreign-born white population decreased by 18.3%. As the result of these differentials, the percentage which the native white population formed of the total increased from 78.4 in 1930 to 81.1 in 1940, while the percentage represented by the foreign-born white population declined from 11.4 to 8.7. The main reasons for the rapid decline in the number of foreign born are two, namely, the fact that during this decade the net immigration was a minus quantity (there being a net emigration of nearly 50,000), and the relatively high mortality rates prevailing among the foreign born because of their high average age. (The median age of the foreign-born white was 43.9 in 1930 and had increased to 51.0 by 1940.)

The Negro population increased 8.2%, or materially less than the native white, between 1930 and 1940, and the minor nonwhite races collectively showed a decrease of 1.4%.

The most important of the changes in the minor nonwhite races was perhaps the decrease from 138,834 to 126,947, or 8.6%, in the Japanese population. Of the total Japanese population in 1940, 47,305, or somewhat more than one-third, were foreign born (for the most part born in Japan), and therefore alien and ineligible for citizenship. The remainder were classified as native on the basis of birth in the United States or in some one of its territories and possessions. Nearly nine-tenths of all the Japanese in the United States were in the three Pacific coast states; in fact, 93,717, or almost three-quarters of the total, were in California alone and 23,321, or about one-quarter of the California total, were in the city of Los Angeles. In addition there were 157,905 Japanese in Hawaii, including 37,353 foreign born, and in the Philippine islands about 30,000 foreign-born Japanese plus an unrecorded number born in the islands.

The figures representing the population classified by race and nativity are summarized in Table III.

The geographic distribution of the several race and nativity classes is by no means uniform. The population of both the north (comprising all the states as far west as the Dakotas and Kansas and as far south as Pennsylvania, Indiana and Missouri) and the west (comprising the states from Montana south to New Mexico and westward) was 96.2% white in 1940; while the population of the south (comprising the states from Delaware, Kentucky and Oklahoma southward) was only 76.0% white. The foreign-born whites formed 12.3% of the population in the north, 10.3% in the west, and only 1.5% in the south. More than three-fourths of the Negroes were in the south, where they formed 23.8% of the population; a little more than one-fifth were in the north (mainly in the cities), where they formed 3.7% of the population; and only a small number in the west, where they formed 1.2% of the population. The other nonwhite races were concentrated in the west, where they formed 2.6% of the total, as against a small fraction of one percent in the north and the south.

Country of Birth of the Foreign Born.—The total number of foreign-born white persons in the United States in 1940 was materially less, as already indicated, than in 1930. The figures shown in Table IV, which distributes the foreign-born white by country of birth, indicate that this decrease was shared rather generally by the foreign-born white from almost all the major source countries. The decrease shown for all countries combined is 18.3%; for three countries, namely, Wales, Northern Ireland and Mexico, a decrease of more than 40% is indicated; while for only four countries are increases shown. The number of German-born in the country decreased from 1,608,814 in 1930 to 1,237,772 in 1940, or 23.1%; and the number of Italian-born from 1,790,424 to 1,623,580, or 9.3%. The more rapid decrease in the German-born probably results from the much higher average age of that group as compared with the Italian-born. The foreign-born white from American sources included 1,044,119 from Canada (273,366 of French stock and 770,753 of other origin, mainly English or other British), with 21,361 from Newfoundland, 377,433 from Mexico, 30,534 from Cuba and other West Indies, and 36,408 from Central and South America, or 1,509,855 in all.

Sex Distribution.—In the total population of the United States the numbers of males and females are rather rapidly approaching equality. In 1910, partly as the result of the recent arrival of large numbers of European immigrants, who were then predominantly male, there were 106.0 males per 100 females in the total population of continental United States and 129.2 in the foreign-born white population taken alone. By 1920 the sex ratio had declined to 104.0 (with 121.7 for the foreign-born white) and by 1930 to 102.5 (with 115.1 for the foreign-born white). The 1940 tabulation shows 66,061,592 males and 65,607,683 females in the total population, or 100.7 males per 100 females; or to state the situation in another way, there were in 1940 only 453,909 more males than females, as compared with an excess of 1,499,114 in 1930. For the foreign-born white alone, in 1940, the sex ratio was 111.1 and the excess of males amounted to 602,892—this figure being partly offset by a large excess of females in the Negro population (sex ratio 95.0), to give the smaller figure just quoted for the general population.

The sex distribution of the population of the United States and of the urban and rural areas is given, for 1940 and 1930, in Table V.

The urban-rural distribution of the male population differs materially from that of the female population. In 1940, for example, 58.0% of the females were in urban areas, as compared with 55.0% of the males; and conversely, 24.1% of the males were in rural-farm territory, as compared with 21.8% of the females. These relations are perhaps brought out even more clearly by the sex ratios, which were 95.5 males per 100 females in the urban area, 103.7 in the rural-nonfarm area, and 111.7 in the rural-farm. The excess of females in the urban population (and this is characteristic of the population of most individual cities as well as of the urban total) is mainly the result of the fact that the cities offer more occupational opportunities for women than the farming areas; and the excess of males in the latter is, conversely, the result of the fact that the farming areas provide more jobs for men than for women.

Age Composition.—With respect to age as well as sex the 1940 census figures record another stage in a long-time trend which has been observed in the population of the United States. The population is steadily and rather rapidly growing older. The median age in 1940 for the entire population was 29.9 years, as compared with 26.4 years in 1930. (The

median age is the age of the person who would stand in the middle of the series if the entire population were arranged in order according to age; in effect, one-half the people are younger than the median age and one-half older.) The median age has been rising steadily ever since 1820, the earliest census for which age data for the entire population are available, at which time the median age was 16.7 years.

Table VI gives the age distribution at the last two censuses for the total population of the United States and its major race and nativity classes, with the percentage of increase for each age group in the total population.

One outstanding feature in the changing age distribution of the population as a whole is the actual decrease in the age groups representing persons under 15 years of age and the very rapid increase in the numbers of persons in the more advanced ages. The number of persons under 15 years of age was actually smaller by 3,084,795, or 8.6%, in 1940 than in 1930, while the number of persons 65 years old and over was larger in 1940 than in 1930 by 2,385,509, or 36.0%. These changes in the age composition result from a declining birth rate on the one hand and, on the other, from improved mortality conditions, which enable more persons to survive to the higher ages. If present conditions continue, the number and proportion of young persons may be expected to decrease still further, while the number and proportion of older persons will, without question, go on increasing.

The changes in the relative distribution of the population with respect to age, which are shown in the lower part of Table VI, are for many purposes more significant than the changes in the absolute numbers. The percentage of the population under 15, for example, declined from 29.4 in 1930 to 25.0 in 1940, while the percentage 65 and over increased from 5.5 to 6.9; or, taking the native white population alone, in order to eliminate the effects of the somewhat abnormal age distribution of the foreign born, the percentage under 15 decreased from 32.8 in 1930 to 26.9 in 1940 and the percentage 65 and over increased from 4.7 to 5.9. In the Negro population, the next largest of the major classes, the changes were somewhat similar, though the decline in the percentages for persons under 15 was somewhat less than in the native white population and the relative increase in the percentages for persons 65 and over was somewhat greater.

The foreign-born white population is in a situation materially different with respect to age changes from that of the other classes, in that this class does not reproduce itself but must be recruited from outside sources; and, for the moment, the sources of outside recruits are very greatly restricted. While the total foreign-born white population decreased only 18.3%, the numbers of foreign-born white persons in all the age groups under 30 years of age decreased by more than 50%, while there was some increase in all the groups representing persons 50 years old and over. These differences in the absolute numbers are reflected in the percentage distributions which show for the foreign-born white smaller percentages in all the age groups up to age 45 and larger percentages in all the groups beyond this age.

The median age of the native white population in 1940 was 26.9 years, about two years below the median for the total population. The foreign-born whites, on the other hand, were as a group more than 20 years older, having a median age of 51.0 years. The Negroes, with a median age of 25.3 years, and the other nonwhite races, with a median of 24.1 years, were younger on the average than the native whites.

Urban residents had a higher median age than the total population, namely, 31.0 years as compared with 29.0 years. Rural-nonfarm residents had a lower median age (27.7 years) and rural-farm residents one still lower (24.4 years). These variations are in part, at least, functions of fertility differentials, which in turn influence the proportion of the total population in the younger age groups. Since urban residents have a much lower rate of natural increase than the rural population, there are relatively fewer children and the average age is higher. Migrants from rural areas, who are principally adults, also contribute to the higher median age of the urban population.

Years of School Completed.—With every successive census, the returns from the question on ability to read and write have shown a decrease in the proportion of illiterates. By 1940 illiteracy was so near the vanishing point in most states, except in the older population and in some special classes, that a question on the highest grade of formal schooling completed was substituted, with the object of measuring at least approximately the whole range of educational attainment among the American people. The first tabulation of the returns from this new question was limited to persons 25 years old and over, in order to avoid the complications involved in the interpretation of this information for persons who might still be in school. Later tabulations will be made for younger persons, giving the current educational attainment separately for those no longer at school and for those still attending school. The data for persons 25 years old and over are summarized in Table VII.

For the entire population 25 years old and over, according to the returns from this question, the median number of school years completed was 8.4; for the native whites, 8.8; for the foreign-born whites, 7.3; for the Negroes, 5.7; and for the other nonwhite races collectively, 6.8.

[1]Persons who worked for pay or profit (except on public emergency work), or assisted without pay in a family enterprise, at any time during the week of March 24–30, 1940, and persons who had jobs (except on public emergency work), businesses or professional enterprises at which they did not work during the week of March 24–30, 1940, because of temporary illness, vacation, industrial dispute, bad weather or layoff not exceeding 4 weeks with instructions to return by a specific date.

[2]The number of persons reported in the census as on public emergency work was considerably below the number indicated by the records of the various emergency work agencies. It is probable that the majority of those on the WPA, CCC and NYA out-of-school programs who were not properly classified in the census were returned as employed in private or nonemergency government work. The great majority of students on the NYA student work program who were not properly classified were returned as in school.

[3]Persons not at private or nonemergency government work, nor on public emergency work, who were seeking work during the week of March 24–30, 1940.

[4]Persons seeking work who had not previously worked full time for one month or more at a single job.

[5]Inmates of penal institutions, hospitals for the mentally diseased or defective, and homes for the aged, infirm and needy.

[6]Includes some persons whose activity during the week of March 24–30, 1940, could not be definitely determined. Preliminary evidence concerning the characteristics of such persons indicates that the great majority of them were not in the labour force.

It may be noted further that 3.7% of all persons 25 years old and over had not completed even one full year of school and that a total of 13.5% had completed less than five years. These figures, of course, should be taken as an index of educational opportunities in times past rather than of the current situation.

On the other hand, 3,407,331 persons, or 4.6% of the whole number 25 years old and over, reported that they had completed four or more years of college. (This does not represent the whole number of college graduates, since there are in addition considerable numbers of college graduates under 25 years of age.) A still larger number (4,075,183) had completed from one to three years of college; 10,551,681 had completed four years of high school (but no college); and 11,181,995 had completed from one to three years of high school. Including those who had completed one or more years of college work, there were about 18,000,000 persons 25 years old and over, or 24.1% of the total, who had completed the high school course.

Employment Status.—Provision was made in the 1940 census for classifying all persons 14 years old and over according to activity during the week of March 24–30, 1940. Two large groups of much the same size were thus obtained: (a) Persons in the labour force, including those employed in private and nonemergency government work, those on public emergency work and those seeking work; and (b) persons not in the labour force, comprising those engaged in housework in their own homes, those in school, those unable to work, persons in institutions, and other persons not in the labour force, including a small number whose employment status was not reported.

The 1940 system of classification represents a considerable improvement over the practice in earlier censuses, in which all persons reporting a gainful occupation, regardless of activity in a particular period of time, were counted as gainful workers. It is to be noted, however, that the comparability of 1940 labour force figures with those for gainful workers in earlier censuses is somewhat affected by the 1940 change in basic concepts. It is possible that certain classes of persons, such as retired workers, some inmates of institutions, recently incapacitated workers, and seasonal workers neither working nor seeking work at the time of the census, were frequently included among gainful workers in 1930, but, in general, not included in the 1940 labour force. On the other hand, the 1940 labour force included new workers, that is, persons seeking work without work experience, few of whom were included in the 1930 gainful-worker group. Moreover, the 1940 aggregate included a considerable number of persons for whom occupation was not reported, a group that would have been entirely omitted by the 1930 approach.

Final census figures on employment status are presented in Table VIII for the population classified by race and nativity. The nation's labour force in the week of March 24–30, 1940, consisted of 52,789,499 persons, of whom 39,944,240 were males and 12,845,259 were females. Males in the labour force constituted 79.0% of all males 14 years old and over, whereas females in the labour force included only 25.4% of the corresponding age group. The proportion of males in the labour force did not vary greatly from one race-nativity group to another, but the proportion for women was variable, ranging from 18.6% for foreign-born white females to 37.8% for Negro females.

One of the most important reasons for subdividing the labour force is to separate the employed and the unemployed. The latter group would ordinarily be derived as the sum of persons on public emergency work programs and those seeking work. A satisfactory total for this purpose cannot be obtained from the census figures alone, however, because difficulties peculiar to the enumeration of public emergency workers resulted in the misclassification of a considerable number of such workers and a consequent understatement of their total number in the census returns. This difficulty can be largely eliminated through the substitution of official agency figures for census returns on the number of persons on the several federal emergency programs. On this basis, an estimate of the number of unemployed is obtained by adding to the 5,093,809 reported as seeking work the 2,906,196 persons on the pay rolls of federal agencies conducting public emergency work programs, excluding students on the NYA student-work program. The resulting total of about 8,000,000 provides a serviceable approximation of the total volume of unemployment in March 1940, although it is subject to a number of minor qualifications, of which perhaps the most important is that the total volume of unemployment may be slightly overstated because some of the misclassified persons might be counted twice, once in the census total for "seeking work," and once in the official agency figure.

One innovation in the 1940 census, the classification of nonworkers by status, is especially timely because of the unusual demands placed upon the U.S. labour supply by the marked growth of wartime production and the necessity for replacing men drawn into the armed forces. Important evidence concerning the types of nonworkers most likely to be drawn into the labour force is available from that part of Table VIII which shows the subdivisions of the 48,313,425 persons not in the labour force. It is clear that the total number of additional males available for work is relatively small, since all but about one-fifth of those 14 years old and over were already in the labour force, and the great majority of the remainder were unable to work or were in institutions or attending school. Some transfers to the labour force are possible from the older members of the group attending school, as well as from the 2,015,054 persons included in the category "Other and not reported," but the total number probably would not be large enough to constitute an important addition to the total labour force.

In the case of women, on the other hand, three-fourths of those 14 years old and over were outside the labour force. By far the largest category of such women consisted of those engaged in housework in their own homes, a group numbering 28,664,744. Many of this group could not shift to the labour force because of age, responsibility for care of minor children or other dependents, and similar reasons, but the number potentially available

Industry not reported	688,836	450,570	1.3	238,266	2.1

for wartime employment would undoubtedly make possible a considerable increase in the size of the working population. Further small additions to the labour force would be available from such categories as "in school," and "other and not reported."

Occupations.—The major groups of occupations in which people engaged in private or nonemergency government employment were working in the week of March 24–30, 1940, are shown in Table IX. Although these figures pertain to the largest group in the labour force (over 85% of the total), the percentage relationships cannot be assumed to apply to the entire labour force, because of the well known fact that the volume of unemployment varies markedly from occupation to occupation.

The distribution of employed persons by major occupation groups differed greatly as between males and females. Nearly one-half of the men were employed in three groups, "Farmers and farm managers," "Craftsmen, foremen and kindred workers," and "Operatives and kindred workers," whereas the proportion of females employed in the same three groups was only slightly more than one-fifth. The leading occupation groups for females—"Clerical, sales and kindred workers," "Operatives and kindred workers," and "Domestic service workers"—accounted for nearly two-thirds of all employed women, a proportion more than twice as great as that for men in the same groups. The widest disparity in representation of the two sexes was shown by the group "Domestic service workers," which included 17.7% of the employed women and 0.4% employed men.

The relationship between residence and occupation is brought out by data in Table IX for the urban, rural-nonfarm and rural-farm areas of the United States. This relationship is particularly apparent in the rural-farm areas, where approximately 7,500,000 out of more than 9,500,000 employed persons were engaged in agricultural pursuits. The remaining 2,000,000 persons represented mainly persons who lived on farms and worked elsewhere, but included as well some proprietors, professional workers, etc., who followed nonfarm pursuits at their farms.

The occupation classification system used in the 1940 census is not completely comparable with the systems used in the 1930 and earlier censuses, though many of the specific classifications (including some of the largest and most important) are the same, or substantially the same. The data presented in Table IX are in terms of 12 major groupings of the 451 specific occupation titles of the 1940 classification system. The 451 items of the complete census list are almost uniformly convertible to a shorter "Convertibility List of Occupations" which was prepared by the Joint Committee on Occupation Classification (sponsored by the Central Statistical board and the American Statistical association) in order to increase convertibility among occupation statistics from various governmental and private sources.

Industries.—The industrial distribution of employed persons shown in Table X reveals marked differences for men and for women. The two most important major categories for men were "Agriculture, forestry and fishing," and "Manufacturing," which together accounted for nearly one-half of the total number employed. The most important industrial groups for females were "Personal services," "Manufacturing" and "Wholesale and retail trade," accounting for nearly two-thirds of all employed women.

The contrast between the industrial distributions of men and of women is brought out even more clearly by subdividing the total number employed into two broad groups, those producing goods and those providing services. More than 56% of all employed men were engaged in the production of goods, including the categories "Agriculture, forestry and fishing," "Mining," "Construction" and "Manufacturing," while the proportion of women in the same categories was less than 26%. On the other hand, the proportion of employed women engaged in some of the industrial categories concerned with the provision of services was much larger than the corresponding proportion for men. The contrast was particularly noteworthy in the case of "Personal services" and "Professional and related services." Over two-fifths of all women were employed in these two groups, whereas the corresponding proportion for men was less than one-twelfth.

The industry classification used in the 1940 census is not fully comparable with that published in earlier censuses. The data presented in Table X are in terms of a list of 45 industry groups, which represent selections and consolidations from a 132-item list designed by an interagency committee to classify industry reports from individuals.

Housing Data.—The census of housing was taken at the same time as the census of population and by the same enumerators. From the housing census were obtained a number of fundamentally important items which have previously been obtained from the population schedule, such as tenure and value or rent of home, and size of family or household. Certain new designations have been made necessary by the added detail called for in this census. A dwelling unit, as the term is here used, is the living quarters occupied by one family or household. In an apartment house there are, therefore, as many dwelling units as there are separate apartments.

Of the 37,336,890 dwelling units reported in the entire U.S., 1,884,016, or 5.0%, were returned as vacant and for sale or rent, while 591,249 were returned as vacant (or at least not occupied by regularly enumerated census families) and not for sale or rent. This last group was made up rather largely of seasonal dwelling units, such as summer homes held for later occupancy by households not living in them at the time of the census.

The percentage of dwelling units vacant and on the market in urban areas was only 4.3, as compared with 6.1 in rural areas. The dwelling units reported include both seasonal and ordinary units, and the larger percentage vacant in rural territory is explained in part by the large number of seasonal units in rural areas.

The number of occupied dwelling units represents approximately the number of private households and may therefore be compared roughly with the number of private families shown in the census reports for 1930. Such a comparison shows that the number of private households increased approximately 16.6%, or more than twice the 7.2% increase shown in the population of the United States between 1930 and 1940. The average population per occupied dwelling unit in 1940 was 3.8 for the United States as a whole, as compared with an average population per family of 4.1 in 1930. More than half of the increase in number of families in the decade is thus due to a decline in family size and less than half to population increase. These figures are summarized in Table XI.

Table XI.—Occupied Dwelling Units or Families, and Population per Unit, 1940 and 1930

Item	Total	Urban	Rural
1940			
Population	131,669,275	74,423,702	57,245,573
Occupied dwelling units	34,861,625	20,600,428	14,261,197
Average population per unit	3.8	3.6	4.0
1930			
Population	122,775,046	68,954,823	53,820,223
Private families	29,904,663	17,372,524	12,532,139
Average population per family	4.1	4.0	4.3

The decline in the average population per family from 4.1 in 1930 to 3.8 in 1940 represents a continuation of the downward trend in family size which is shown by the following averages from earlier censuses: 4.9 in 1890, 4.7 in 1900, 4.5 in 1910 and 4.3 in 1920. The decline in the average size of the family in the United States is due primarily to increased urbanization and the decline in the birth rate. (L. E. T.)

Centennials: *see* CALENDAR, 1942, page xx.

Central America. The region between Mexico and South America, embracing the colony of British Honduras, the republics of Guatemala, El Salvador,

Honduras, Nicaragua and Costa Rica (*qq.v.*) and usually regarded as also including Panama and the Panama Canal Zone (*qq.v.*). These eight political entities have an area of around 222,674 sq.mi. The population, approximately 8,500,000 in 1941, is concentrated chiefly on the highland plateau adjacent to the Pacific, where it is about 65% Indian in Guatemala, predominantly mestizo in the middle republics, and largely white in Costa Rica. Panama includes a large Negro element of West Indian extraction, while the low Caribbean slope and British Honduras are chiefly negroid. In religion, the people are overwhelmingly Roman Catholic. The republics, with the conspicuous exception of Costa Rica, and perhaps of Panama, are virtual dictatorships.

The Central American republics were active protagonists of hemispheric defense during 1941. Vigorous repression of pro-axis agitators was the rule, notably in Costa Rica, a focal point of nazi machinations. Except for a successful coup d'état in Panama, there were no internal disorders. With striking unanimity the six republics responded to the Japanese attack upon the United States in December with declarations of war against all the principal axis powers.

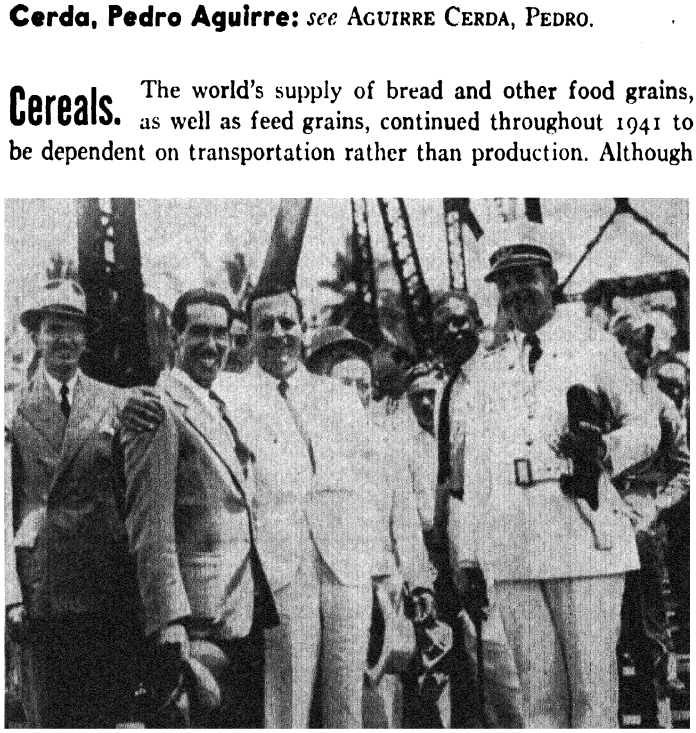
Education.—Education and literacy vary greatly from country to country, with Costa Rica by far the most advanced.

Trade.—In 1940, Central American imports approximated $78,800,000 in value, exports $57,600,000, representing decreases of 10% to 15% from 1939 totals. Foreign trade generally expanded in volume and value during 1941. From 60% to 95% of all 1940 exports went to the United States, which supplied slightly greater percentages of imports. Imports are largely foodstuffs, fuels, textiles, machinery and other manufactured goods. Coffee from the Pacific uplands and bananas from the lowlands are the chief agricultural commodities, with the trend toward greater diversification, however. British Honduras's main exports are logwood, hemp and chicle. Gold mining is of increasing importance, especially in Nicaragua, where gold usually contributes 70% of all export values. Corn and beans for domestic consumption are usually the most important crops from a domestic point of view.

Communication.—External communication is by sea and by Pan American airways, with internal air service by Central American Air transport ("TACA") and domestic lines. Railways and highways provide further but inadequate communication. Construction of the Inter American highway, however, was being pushed at an accelerated rate during 1941. (*See* articles on separate countries and HISPANIC AMERICA AND WORLD WAR II.) (L. W. BE.)

Cerda, Pedro Aguirre: *see* AGUIRRE CERDA, PEDRO.

Cereals. The world's supply of bread and other food grains, as well as feed grains, continued throughout 1941 to be dependent on transportation rather than production. Although severe shortages were prevalent in certain areas, particularly throughout Europe, new production added still further in other areas to huge surpluses which were already amply sufficient for the needs of the entire world. Submarine and mine sinking of grain cargoes and other wartime destruction of grain stocks was apparently inconsequential.



PRESIDENT ARNULFO ARIAS of Panama (second from left) and President Rafael Calderon Guardia of Costa Rica (with arm around Arias) gave a visual demonstration of the good-neighbour policy in April 1941 at the opening of a new international bridge connecting the two countries. Arias, long accused of pro-Fascist sympathies, was forced out of office Oct. 7, 1941 in a bloodless revolution

In Jan. 1942 a Canadian government report quoted the *Southwestern Miller* (United States) to the effect that sinkings of wheat (chiefly cargoes destined for Britain) were estimated at 20,000,000 to 25,000,000 bu.; total deterioration and destruction from war, including the bombing of warehouses, was 40,000,000 to 60,000,000 bu. World production of wheat in the crop year of 1941-42 was estimated by the office of foreign agricultural relations, U.S. department of agriculture, at 6,020,000,000 bu. The 1941-42 crop year included the 1941 harvest in the northern hemisphere and the 1942 harvest in the southern hemisphere. The world wheat crop was 6,030,000,000 bu. in the crop year of 1940-41.

The "Big Four" (United States, Canada, Argentina and Australia) in 1941 added a 670,000,000-bu. exportable surplus to their already large accumulations. The 1941 crop of grains in Europe, although below normal because of bad weather, was reported to have afforded some easing of bread rationing and adulteration of wheat flour with barley, rye and potato flour. The U.S.S.R. was reported to have added extensively to the fall (1941) planting of winter wheat and rye in western Siberia, to replace the loss of the Ukraine. Autumn planting of grain in German-held parts of the U.S.S.R. in 1941 was reported not very successful. Reserve supplies of grain in the United Kingdom were reported at 50% more than before the war, but the proportions of bread and feed grains in these stocks were not disclosed. Normal disappearance of wheat in the United Kingdom is about 260,000,000 bu. per year. At the beginning of the year the British government offered $8 per ac. for grassland plowed up and sowed to grain or other food crops. In France, where bread rationing was 8 oz. per person per day (a slim ration for the French), the government appropriated $120,000,000 to pay the difference between the price of bread and the price of wheat. The fixed price of wheat was $1.58 per bushel. The 1941 wheat acreage in Europe was placed at 408,000,000 ac.; the crop at 74,800,000 bu. The 1940 acreage was 406,400,000 ac. and the crop was 72,600,000 bu. These estimates were unofficial, since very few European countries permitted figures to be published in 1941. A short crop in 1941 in Turkey prevented any export of grain from that country and caused the establishment of a bread ration of 1½ lb. per person per day for labourers. The ration was less for sedentary workers. Shipments of wheat by Britain relieved a shortage in Syria and permitted the suspension of bread rationing in Palestine. Cold weather injured the wheat crop in Spain and Italy and reserves were dwindling rapidly.

With the outbreak of war between the United States and Japan, the price of feed grains in the United States advanced sharply, as they did when the United States entered World War I. Feed supplies, however, were much larger than they were in 1917. The government established a feed control unit in 1941 to prevent an excessive advance in feed prices. World supply of rice was abundant in 1941, with unsalable surpluses in Burma and other exporting countries and with a number of American countries entirely or partly self-sufficient and no longer dependent on the Orient for rice. Production was increasing particularly in Peru, Ecuador and Guatemala. (*See* BARLEY, CORN, OATS, RICE, RYE, WHEAT; *see* also FARM INCOME for U.S. lend-lease exports to Great Britain.) (S. O. R.)

Ceylon. A British crown colony, lying off the southern extremity of India and approaching within 6° of the equator. Area 25,332 sq.mi.; pop. (est. Dec. 31, 1939) 5,992,000. Chief towns (pop. census 1931): Colombo (cap., 284,155); Jaffna (45,708); Galle (34,424); Kandy (37,147). Governor, Sir Andrew Caldecott, K.C.M.G.; languages, English, Sinhalese, Tamil; religions, Buddhism and Hinduism the chief.

History.—Prior to the outbreak of war, Ceylon had—like its big brother India—been in the throes of political agitation. In essence the demand came from the intelligentsia, and was for self-determination and home-rule; but in Ceylon it was linked with dislike of the form of constitution, by which the administration is in the hands of a number of departmental committees. These committees, in the words of Sir Andrew Caldecott, the governor, had developed "no party program, policies or loyalties," and a movement toward cabinet government seemed inevitable. In Oct. 1941, however, the British government, while regarding reform as urgent, decided that further enquiry by commission or conference was essential, but could not be undertaken during the war. Meanwhile, a minor problem relating to the status of Indians in Ceylon had been amicably settled in September, by a provisional agreement which covered both residents and future immigration.

The colony's budget for 1941–42 showed a deficit of 2 crores of rupees ($7,000,000), largely by reason of defense measures. To meet it, the prosperous industries of tea and rubber were

subjected to special taxation on their exports—1½ cents per lb. on the former and 2½ cents on the latter—and an excess profits duty of 50% was imposed on all business concerns. The island's war effort included the equipping of a squadron for the R.A.F.

(ME.)

Education.—In 1939: schools, 6,100, including 336 English schools, 74 bilingual, 3,723 Sinhalese and Tamil (820 estate and 780 unaided); scholars: boys 502,917, girls 325,173.

Banking and Finance.—Revenue (1938–39) Rs. 117,426,650; (est. 1939–40) Rs. 123,484,600; expenditure (1938–39) Rs. 120,502,590; (est. 1939–40) Rs. 129,504,965; public debt (Sept. 30, 1939) £12,258,775 and Rs. 40,270,000; currency Rs. 1 = 100 cents = 1s.6d. in 1941.

Trade and Communication.—Overseas trade, merchandise, 1940: imports Rs. 282,595,229; exports (domestic) Rs. 358,958,405; re-exports Rs. 25,979,201. Communications and transport 1938: roads, main surfaced 4,485 mi.; railways (117 mi. narrow gauge), total 960 mi.; shipping, entered 1938, 13,228,439 net tons; motor vehicles licensed (Dec. 31, 1939), 21,014 motor cars and taxis; 4,408 trucks and vans; 2,574 omnibuses; 2,906 cycles; 52 tractors; 210 trailers; wireless receiving set licences (Dec. 31, 1937), 4,911; telephone instruments in use (1938), 10,424.

Agriculture.—Production, in metric tons: rice (1938–39) 300,000; copra (including coco-nut oil) (1939) 155,000; tea (1939) exports 103,400; rubber (1939) shipments 62,000.

Chaffee, Adna Romanza (1884–1941), U.S. army officer, was born Sept. 23 at Junction City, Kan., the son of a former chief of staff of the U.S. army. He was graduated from West Point in 1906, the Fort Riley cavalry school in 1908 and the Saumur cavalry school in France in 1912. During World War I, young Chaffee, then a major, was sent to France, where he attended the general staff college in Langres. He saw action in both the St. Mihiel and Meuse-Argonne offensives in 1918 and won the D.S.M. In 1930 Chaffee anticipated the advent of an army moving on wheels which would revolutionize methods of warfare, and urged the war department to equip the U.S. army with tanks and tractor-borne trucks. At first Chaffee was considered a visionary; later his theories of mechanized armies were put into practice. In 1938 Chaffee was named to command the mechanized 7th cavalry brigade, the only mechanized unit in the army, and was promoted to brigadier general. Prior to his death he was appointed major general and was awarded the oak leaf cluster. He died in Boston, Aug. 22.

Chambers of Commerce. National defense requirements were given ever-increasing consideration by business and industry in the United States during 1941. Tremendous increases were shown in industrial production for defense purposes and business institutions of all kinds sought to adjust themselves to the numerous and complicated requirements of the defense program. Upon the entrance of the United States into World War II on Dec. 8, 1941, organized business immediately enlisted for the duration. Chambers of commerce and trade associations at once changed to a war basis, with war activities given preference over all others.

The Chamber of Commerce of the United States, which is a federation comprising 1,689 chambers of commerce and trade and industrial associations, with membership of approximately 1,000,000 business men, continued to interpret the economic and social aspects of the national defense program, and to give its full support to defense measures.

With the declaration of war by the U.S., the national chamber correlated the activities of its nation-wide member organizations to effect victory. (A. W. H.)

Channel Islands: *see* BRITISH EMPIRE.

Cheese. United States cheese production in 1941 substantially exceeded 900,000,000 lb. for the first time. The increase was a direct result of the government lend-lease program to expand the output of cheese because this product is a highly important part of the established diet in Great Britain.

In every month of 1941 production increased by amounts ranging from 4,000,000 to almost 20,000,000 lb. For the first 11 months the output was 847,250,000 lb., compared with 733,469,000 lb. in the same period of 1940. American cheddar cheese accounted for 670,605,000 lb. of the 11 months' output in 1941. A number of creameries and condenseries manufactured cheese for the first time. The government's lend-lease program called for still further increase in cheese production in 1942, possibly by as much as 33%, and governmental aid to assist in plant expansion was announced.

The department of agriculture began its expanded program of purchase of food for Britain March 15, 1941, and from that date to Dec. 1, 1941, bought 137,566,710 lb. of cheese at a f.o.b. cost of $31,544,071 to ship to the United Kingdom. Storage stocks of cheese, largely held by the government for export, were 188,225,000 lb. Dec. 1, 1941, compared with 137,389,000 on the same date in 1940 and a five-year (1936–40) average of 120,212,000 lb. on that date. While the great majority of such governmental purchases were intended for transfer to other countries under lend-lease provisions, a part of the supplies were available for Red Cross, relief and school-lunch purposes.

In Canada, production of cheese in the first 11 months of 1941 was 141,118,934 lb., an increase of 0.6% over the corresponding period of 1940. The Canadian government adopted control measures over the shipment and storage of cheese. In Australia and New Zealand, governmental measures were advanced to increase the production of cheese and other dairy products. As a result of these several governmental activities, the British supply of cheese was increased, and by order of the food ministry Oct. 29, 1941, establishments could serve cheese as a subsidiary dish without restrictions. (*See* also DAIRYING; MILK.) (S. O. R.)

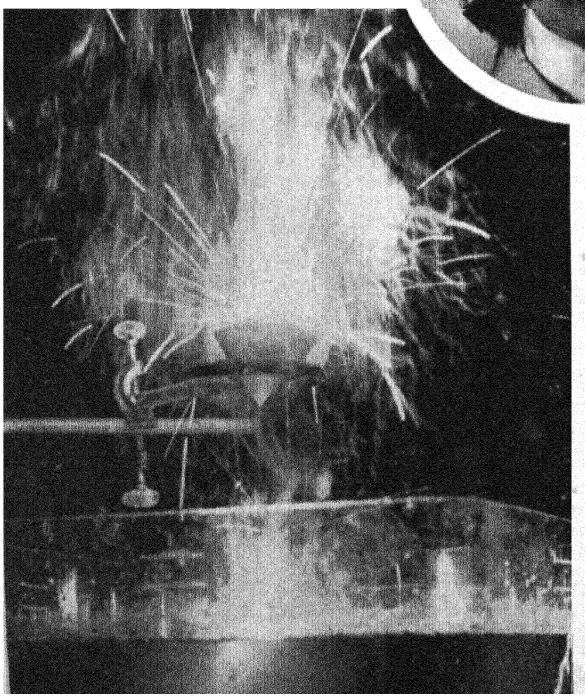
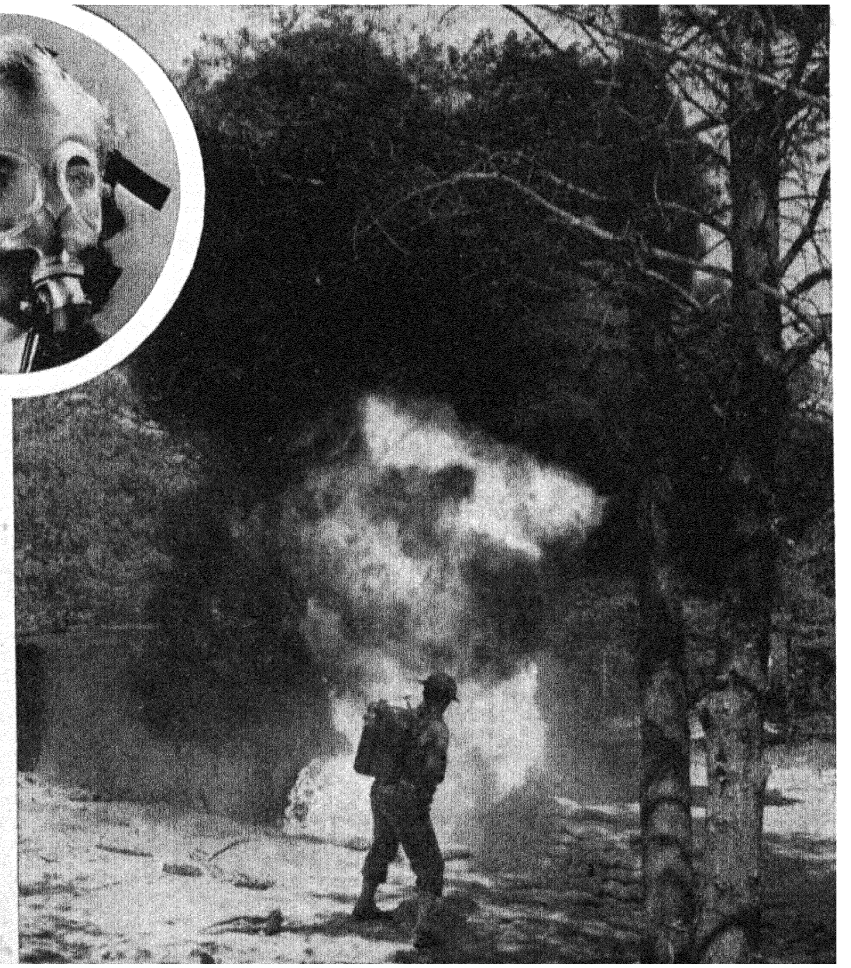
LABORATORY DEMONSTRATION conducted in 1941 at Columbia university, New York city, to show how thermite incendiary bombs burn under water





Chemical Warfare. The situation with respect to chemical warfare during the second year of World War II was exactly similar to that prevailing throughout the first year in its two main aspects. In the first place, no single instance of the actual use of toxic chemicals of any kind by any of the combatant powers against either troops or civilians was substantiated. In the second place, however, unconfirmed reports were circulated assiduously at frequent intervals that such use was contemplated in the immediate future. These reports varied in their specific details. Sometimes the assertion was made that a poison gas attack had definitely been delivered at some remote section in the far-flung battle front; sometimes it was stated that detailed instructions for the employment of poison gas on a large scale had been discovered in a captured army headquarters; sometimes it was disclosed that enormous stocks of toxic chemicals, ready for use, had been accumulated at critical frontier points.

While all such rumours were primarily, it was obvious, circulated for propaganda purposes, it was certain that they sufficed to maintain tense expectation of possible developments in chemical warfare throughout the year.

In one respect, the axis powers held a very real advantage in the matter of the potential threat of chemical warfare. They could be confident that the allies would respect their renunciation in the Geneva gas protocol of 1925 (a protocol signed and ratified by 39 members of the League of Nations) of "the use in war of asphyxiating, poisonous and other gases and all analogous liquids, materials and devices" to the length that they would never be the first to reintroduce chemical warfare and would employ it only in retaliation. On the other hand, Germany undoubtedly has built up considerable reserves of chemicals suitable only for poison gas purposes and, it was generally believed in 1941, outside the axis powers, that Germany undoubtedly would not scruple to employ such chemicals against its opponents in the field or against civilians whenever it suited its ends to do so.

Nazi Germany, consequently, could compel the Allies to divert a vast amount of war energy, both man power and material, which could otherwise be put to services of greater urgency, into the task of building up an elaborate and comprehensive gas defense organization. The entire population of Great Britain had been supplied with gas masks and educated in the measures to be taken if a gas attack was made; if such an attack is never made the whole of this labour will have been an unnecessary drag upon the national war effort.

The nazis themselves, meanwhile, have been at liberty to take the problems of chemical defense more lightly, knowing that their civilians, although not provided with the same protection, were in no immediate danger.

It is most important to note, however, that Germany retained the advantage just described only so long as its leaders refrained from initiating chemical warfare; the day that chemical warfare is started the pendulum swings over to the other side. For Great Britain would certainly not hesitate in this war, as it did hesitate in World War I, to retaliate, and Germany could not count in 1941, as it could in 1915, upon a six-months' start. Its own troops and its own population would be at once exposed to the same perils.

It was therefore legitimate to draw the conclusion that, in all probability, the reintroduction of chemical warfare would be deferred by Hitler (who was himself a British mustard gas casualty in 1918) until the very latest moment, when it would constitute a last desperate gamble for victory. Allied scientists, knowing how far progress in gas defense has outstripped progress in gas attack since 1918, were confident in 1941 that this last desperate gamble would fail. (J. KL.)

Chemistry. Curtailment in chemical activity throughout the world is reflected in the number of abstracts (about 52,000) for 1941 compared with those (about 58,000) for 1940. Selected topics from these articles are presented below to show significant trends in chemistry during 1941.

Detection of Traces of Water.—Frequently it is a matter of importance to be able to analyze for traces of water, such as the percentage of water in alcohol or acetone or acetic acid. A versatile reagent for this purpose was discovered in 1935 by Karl Fischer.

Since 1939 it has been developed extensively by D. M. Smith, Bryant and Mitchell of the du Pont company.

The Karl Fischer reagent is a brown-coloured solution of iodine, sulphur dioxide and pyridine in methanol. Traces of water in a solution to which it is added drop by drop discharge the brown colour, hence its colour serves as an indicator to detect the end point of the titration. This reaction occurs: $SO_2 + I_2 + 3\ C_5H_5N + H_2O \rightarrow 2C_5H_5NHI + C_5H_5NSO_3$ (which reacts further with methanol to produce $C_5H_5NHOSO_2OCH_3$).

Smith found that the reagent may analyze for the water in a variety of substances such as alcohols, esters, acids, hydrocarbons, and the like. Aldehydes and ketones cannot be tested directly, however, because the methanol in the reagent interferes. This interference can be offset if the cyanhydrin of the aldehyde or ketone is prepared first by addition of hydrogen cyanide and the water titrated thereafter in the usual way.

Development of this work revealed that the Karl Fischer reagent could be used not only to determine water as an impurity in alcohols but also to analyze alcohols themselves. The basis of this procedure is to add an excess of acetic acid (containing boron trifluoride as catalyst) to produce water and the acetic ester quantitatively. The quantity of water formed is an index of the alcohol taken and is determined by the reagent. In identical fashion, organic acids may be analyzed by esterifying with an excess of methanol (containing BF_3) after which the water produced is analyzed as before. A method for analyzing acid anhydrides was also developed. In this method a slight excess of water is added to change the acid anhydride into the acid, then the excess of water is titrated. The water consumed in the first operation indicates the quantity of original acid anhydride. Other interesting applications of this useful Karl Fischer reagent were reported.

Organic Components of Corals.—In 1846 Silliman, in his classical study on the composition of corals, pointed out that in spite of their inorganic appearance, the stony- or reef-corals contain 4% to 8% of organic matter. He also observed that part of this organic matter was a wax which could be separated from its inorganic surroundings by boiling with water.

Nearly a century passed without further characterization of this organic material. Lester and Bergmann of Yale university confirmed Silliman's observation and found that this wax occurs to the extent of 0·25% to 0·5%, and identified it as cetyl palmitate.

This wax, known as spermaceti, is the same as that obtained from the sperm oil contained in the head cavity of the sperm whale.

Industrial Production of Nitroparaffins.—Nitroparaffins such as nitromethane or nitropropane have been known for many years but until recently they have been curiosities, hard to prepare and with no uses. A few years ago laboratory experiments at Purdue university showed that these substances could be made by direct nitration of the hydrocarbons in natural gas, if performed at elevated temperatures in the vapour phase. Production of nitroparaffins industrially was started during 1941 by the Commercial Solvents corporation in their plant at Peoria, Ill. In

view of the cheapness and availability of natural gas as a raw material, and in view of the remarkable properties of the nitroparaffins, this development represents an important milestone in industrial chemistry. Nitromethane, CH_3NO_2, is a liquid whose boiling point is about the same as water. Many uses for it as a solvent have been reported already. The condensation of nitromethane with aldehydes in the presence of alkalis yields nitro alcohols.

Formaldehyde, for example, yields trishydroxymethylnitromethane $(HOCH_2)_3CNO_2$. The trinitrate of this alcohol is valuable as an explosive.

The properties of the esters of these nitro alcohols were reported in 1941 by Tindall.

Nitroparaffins, although insoluble in water, dissolve readily in alkali. When chlorine is passed into such a solution, chloronitroparaffins are formed immediately. Trichloronitromethane is the well known chloropicrin.

Another reaction of nitroparaffins is their behaviour towards mineral acids; 1-Nitropropane, for example, when treated with sulphuric acid changes into propionic acid and hydroxylammonium sulphate. This provides a cheap source of hydroxylamine for the first time, as well as an independent source of propionic acid.

Hydrogenation of the nitro group in the nitroparaffins has proved to be an excellent method of obtaining amines. The nitroalcohols, similarly treated, yield amino alcohols. This brief survey of the reactions of nitroparaffins takes up but a few of the many applications which have been announced.

Chemical Substances in Cork.—Drake and collaborators at Maryland have done much to extend knowledge of the composition of cork. Sitosterol has been identified definitely. Phellonic acid, another ingredient, has been shown to be 22-hydroxytetracosanoic acid; *i.e.*, a 24-membered straight chain hydroxy acid wherein the hydroxy group is on the 22nd carbon from the terminal acid carbon. Paraffin hydrocarbons, $C_{21}H_{44}$ to $C_{31}H_{64}$, have been characterized also. Most of Drake's work, however, has dealt with the elucidation of the structure of friedelin, a cork substance isolated many years ago and named in honour of the famous French chemist Friedel. His work proves that friedelin, $C_{30}H_{50}O$, is a pentacyclic unsaturated ketone. Twenty-two of the 30 carbons make up the five rings. These are thought to be staggered in the manner of phenanthrene or picene since, on drastic dehydrogenation with selenium dioxide, 1,2,8-trimethylphenanthrene and 1,8-dimethylpicene were obtained.

Maleic Anhydride from Turpentine.—Phthalic acid is inexpensive because it is prepared so readily from naphthalene by oxidation with air over a hot vanadium pentoxide catalyst. Maleic acid is prepared in the same way from benzene. The yield, while good enough to make maleic acid an industrial chemical, does not compare with the excellent yield of phthalic acid from naphthalene.

In a search for another way to prepare maleic acid economically, Clark and Hawkins of Florida studied the oxidation of alpha-pinene, which is the major ingredient in American turpentine. They found that about the same yields, namely, 25–30% of maleic acid could be realized from alpha-pinene as from benzene. The experimental conditions consisted in passing a mixture of pinene vapour and air at 425°C. over a vanadium pentoxide catalyst. Formaldehyde and carbon dioxide were formed also.

Zeolites and Ion Exchangers.—Certain materials in the soil are called zeolites. These are related to clay and include such substances as the glauconites, bentonitic clays, or hydrated aluminum double silicates. In the soil these compounds may occur as calcium salts. Such zeolites tend to bind potassium or ammonium ions when potassium or ammonium salts are placed upon a soil. One may visualize what occurs by letting CaZ represent a calcium zeolite, whereupon reaction with potassium chloride ($2KCl$) produces potassium zeolite (K_2Z) and calcium chloride ($CaCl_2$). The calcium chloride washes off in rain water, and the valuable potassium ion is held by the insoluble zeolite.

Artificial zeolites, known as permutites, are made by melting kaolin (aluminum silicate) with quartz and soda. Their chief use has been to soften hard water. The mode of action is to replace the calcium in hard water by sodium. To do this, hard water is passed through a tank of sodium zeolite (Na_2Z). The water leaving the tank is soft. At intervals a brine solution (sodium chloride) is passed through the tank to regenerate the sodium zeolite and rinse out the undesirable calcium. The reversibility of the process and the insolubility of the parent substance is what makes it valuable.

This type of base exchange has been known for nearly a century, and its application to water purification has been practised for decades. In spite of this, intensive research on the general problem has been carried on only since 1935, following the discovery of Adams and Holmes that certain synthetic resins possessed ion-exchange properties.

The new zeolites are referred to as carbonaceous zeolites and resinous zeolites. A disadvantage of the natural zeolites was their instability toward acid solutions. Both of the newer types are stable in acid solutions.

Carbonaceous zeolites are obtained by treating coal or lignite with strong reagents such as fuming sulphuric acid, or chlorosulphonic acid. Broderick and Bogard of the U.S. bureau of mines reported that good carbonaceous zeolites could be made from Alabama bituminous coal by treatment with sulphur trioxide at 150°C. It may be assumed that there is sulphonation of hydrocarbon positions in the coal skeleton (*i.e.*, $\equiv CH$ changes to $\equiv CSO_3H$). Since these carbonaceous zeolites are sulphonates, they may function either as hydrogen zeolite or sodium zeolite. Regeneration of the hydrogen zeolites may be accomplished by treating the sodium zeolite with acid. Hydrogen zeolites, then, may remove metallic cations from solution and add only hydrogen ions into the solution in exchange. Beaton and Furnas of Yale university applied this method to concentrate extremely dilute copper sulphate solutions. Under idealized conditions, in a zeolite system concentrating dilute copper sulphate (1 g. in 2000 g. of water), one pound of sulphuric acid brought about an increase in concentration equivalent to the evaporation of over two tons of water. This method should have broad applications to recovery problems.

Resinous zeolites are of two types: (1) a phenol-formaldehyde resin into which sulphonic acid groups are incorporated; (2) condensation products of aniline or aromatic amines with aldehydes, into which strong basic groups are introduced, such as quaternary ammonium hydroxides. The first of these is a cation exchanger which functions much like the carbonaceous zeolites. The second is an anion exchanger. It is obvious that if a salt-containing solution is passed through both types of resinous zeolite in turn, all dissolved salts will be removed from the water. Myers and Eastes of Resinous Products and Chemical company reported on favourable tests in water purification by this type of approach. The development was finding new uses in cases where very dilute solutions were involved.

Zein.—Zein was the name given in 1821 to the alcohol-soluble protein of corn by its discoverer, Gorham. Its interest at the present time owes to the fact that it is new industrially. Swallen of Corn Products Refining company was active in this development.

Zein is isolated commercially from gluten meal which, on a dry basis, is about half protein. It is extracted for two hours with warm isopropyl alcohol containing 15% of water. After filtration, the extract is mixed with hexane. Two layers form, most of the zein remaining in the lower layer, from which it is precipitated by

dilution with water.

Zein reacts with formaldehyde to form a tough plastic, but it reacts more slowly than other proteins such as casein. This is an advantage since the formaldehyde may be mixed directly with the zein and other ingredients before baking at 100°C. to effect the curing reaction. The plastic may be machined and dyed from aqueous dye baths. Another outstanding use for zein appears to be as a decorative coating for labels or magazine covers where a pleasing surface is desired.

Distillation of Sugars.—When sugars are heated they undergo caramelization and charring. Distillation in the customary sense is impossible. This is one of the reasons why experimentation with carbohydrates is difficult. Syrups which resist crystallization have been particularly troublesome to characterize, and these include malt syrup, honey, corn syrup, "hydrol" and others.

Carbohydrate mixtures may be separated by converting them to methyl ethers which are distillable. The unfortunate part of this operation, however, is that with disaccharides (sucrose, maltose, lactose) or trisaccharides (raffinose, melezitose) there is no way to regenerate the sugars from the ethers without destroying the sugar itself.

This difficulty was solved by Hurd, Gordon and Liggett of Northwestern university. They convert the sugars to propionic esters by the action of propionic anhydride and pyridine. Such propionates were found to be distillable, even from the trisaccharides, at temperatures between 160 and 300°C. if the pressure was lower than 0.001 mm. of mercury. In this way, propionates of mono-, di- and trisaccharides could be collected in separate fractions. Mild alkaline treatment was found to remove the propionate groups and bring about regeneration of the sugar itself. Identification of the sugar in this purified state would follow the customary procedures. The fact that many of the sugar propionates were crystalline solids was helpful also in characterization.

Wing Pigments of Butterflies.—Work in this field has been in progress for several years and the problem was in 1941 unsettled. The chief investigators have been the German chemists Wieland and Schoepf. The wings of butterflies are extracted with ether to remove oily material, then the pigment is dissolved out with dilute ammonium hydroxide. A kilogram of wings gives about 35 g. of crude pigment or 14 g. of purified material.

The term pterin is defined as the coloured or colourless pigment occurring in the form of fine particles beneath the chitin of insects. In chemical composition pterins are very closely related to the purines. Their purification has been very difficult, and no simple means of characterization has been at hand, because of lack of melting points. Since 1930 at least four different empirical formulas have been put forward for leucopterin, the colourless pigment of white butterflies, namely $C_{10}H_{10}O_6N_8$, $C_{19}H_{19}O_{11}N_{15}$, $C_{19}H_{17}O_{11}N_{15}$ and $C_{18}H_{15}O_9N_{15}$. The last was proposed by Wieland in 1941. Coloured pigments such as xanthopterin and chrysopterin are similar but have less oxygen content. That xanthopterin may be oxidized to leucopterin by peroxides was demonstrated by Wieland, who also reported a 90% yield of leucopterin by heating a mixture of 2,4,5-triamino-6-hydroxypyrimidine and oxalic acid for one hour at 260°C.

Crystallization of Glycerol.—As most persons know glycerol, it is a thick, colourless liquid that resists solidification, in spite of the fact that crystalline glycerol is known to melt at 18°C. Hass and Patterson discovered that glycerol may be crystallized conveniently if, instead of chilling it to very low temperatures, it is dissolved in a solvent such as butyl alcohol and kept at ice temperature. It is desirable to add a "seed" of crystalline glycerol to help initiate the crystallization process. Glycerol seed crystals were obtained from pure liquid glycerol by leaving it a few hours at -80°C., the temperature obtained in a Dewar flask with a mixture of dry-ice and acetone.

This process makes it possible to purify glycerol in cases where distillation methods fail. One such instance is the glycerol formed by hydrogenolysis of carbohydrates, which is contaminated by glycerol-like substances with boiling points close to that of glycerol itself. These impurities remain in the solvent in the crystallization process.

An Abnormal Wurtz Reaction.—The reaction between sodium and alkyl halides, discovered decades ago by Wurtz, is a general method for the preparation of paraffin hydrocarbons. In such a reaction, ethyl bromide yields butane, butyl chloride produces octane, and so forth. Much of the knowledge of this reaction has been with comparatively simple alkyl halides.

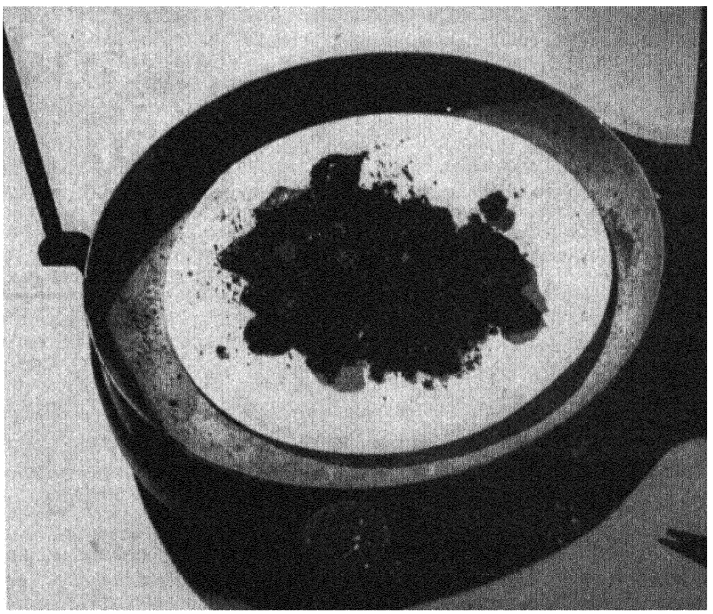
Neopentyl chloride $(CH_3)_3CCH_2Cl$, being an alkyl halide, should undergo this reaction, but the unavailability of such highly branched compounds explains why no such study has hitherto been attempted. Most of the knowledge concerning the chemistry of compounds of this type has been reported within the last decade by F. C. Whitmore of Pennsylvania State college. His results have shown that the so-called general reactions of aliphatic compounds frequently encounter abnormalities when applied to neopentyl systems.

Whitmore and collaborators subjected neopentyl chloride to the Wurtz reaction. Its empirical formula is $C_5H_{11}Cl$. Instead of giving rise smoothly to an isomer of decane ($C_{10}H_{22}$) the yields of it ranged only from 1% to 13%. The major products of the reaction were neopentane and 1,1-dimethylcyclopropane. To produce the 3-membered cyclopropane ring in this reaction was most unexpected and it furnishes another instance of the remarkable effect of structure in limiting general organic reactions.

Non-sulphur Analogues of Vitamin B_1.—The synthesis of Vitamin B_1, or thiamin chloride, was one of the significant accomplishments of 1938. This compound was shown to consist of two units, one a pyrimidine unit and the other a thiazole unit, actually 5-hydroxyethyl-4-methylthiazole.

Thiazole itself is a heterocyclic compound, C_3H_3NS, with the three carbons, the nitrogen and the sulphur making up a 5-membered ring. Each hydrogen is attached in turn to a carbon atom. Pyridine, another heterocyclic compound, is C_5H_5N. In many ways thiazole is known to be like pyridine. Both boil at 115–117°C. The compounds smell alike and both are weak bases.

SYNTHETIC COKING COAL, produced from vegetables subjected to intense heat and pressure, was exhibited in 1941 by Dr. Ernst Berl of the Carnegie Institute of Technology in Pittsburgh



It occurred to Elderfield of Columbia university that it would be interesting to synthesize the pyridine analogue of thiamin chloride to see whether it possessed curative properties toward polyneuritic animals. This involved the synthesis of 3-hydroxyethyl-2-methylpyridine. The starting materials in this synthesis were acetoacetic ester, ethylene glycol, ammonia, and malonic ester. The synthesis was accomplished successfully but no word was received up to the close of 1941 regarding its physiological behaviour. It would be surprising if it possessed thiamin activity, however, in view of the specificity of the structures of most compounds of biological interest. (*See* also INDUSTRIAL RESEARCH; VITAMINS.)

Chemistry and Engineering, Agricultural, U. S. Bureau of.

War in Europe and the approach of war to the United States had a profound effect on the research work of the bureau of agricultural chemistry and engineering during the fiscal year 1941. Because of the trend of events and the added importance of chemical and engineering research to a nation at war, Dr. Henry G. Knight, chief of the bureau, appointed a defense planning committee as early as Aug. 1939, after which there was directed effort toward making all research projects of particular use in the emergency.

As a result of early preparation, much of the bureau's work was already of such a nature as to be readily brought into line to obtain new information in demand as a result of trade disruptions and new needs. The bureau had in 1941 a co-ordinator of defense activities and a group of advisers ready on call for technical consultation with governmental agencies and other organizations.

The bureau stressed research on the industrial utilization of farm products and on the possibilities of such utilization for the manufacture of materials of military importance or things that had taken on added importance because of shipping difficulties. Other broad fields that received attention from the bureau were food conservation and preservation, development of camouflage materials, nutritional and pharmaceutical replacements and supplements, chemical and technological service on foods shipped under the lend-lease plan, and agricultural machinery and equipment for producing, processing, shipping and storing of crops.

In his report covering the fiscal year, ending June 30, 1941, Dr. Knight showed that the four new regional research laboratories, at Philadelphia, Pa., Peoria, Ill., New Orleans, La., and Albany, Calif., were actively engaged on many research projects although the buildings were ready for partial occupancy less than a year before. Projects under investigation in these laboratories included, as examples: Studies of starting materials for use in the manufacture of rubber substitutes; modifications of various oils as replacements for scarce ones; economical collection of farm residues (straws, stalks, hulls) for manufacture into various products including plastics and rubber intermediates; utilization of cornstarch and dextrose; storage effects on corn; new corn-sugar fermentation processes; new motor fuel sources; materials for blackouts; nitration of lint cotton for use in place of cotton linters for high explosives; use of baled cotton to stop bullets; protection of sandbags against rotting; processing sweet potatoes for starch to take the place of imported tropical root starches; and preservation of foods, particularly fruits and vegetables, for use in wartime.

Other bureau laboratories, long established, brought out results during the year which promised usefulness in industry, on the farm and in the household. Some of the results having to do, directly or indirectly, with meeting urgent problems of the nation at war are given briefly below.

Dehydration of vegetables was improved from the standpoint of colour, flavour, vitamin retention and time required for rehydration for cooking. Substitutes were developed for some products hard to get because of war. Examples of such findings were wax and aconitic acid from the cane sugar industry. Compressing of flour to two-thirds of original volume for overseas and military shipment was found to decrease the loaf volume about 15%, without affecting palatability. Serviceability test and rot-proofing treatment were developed for sandbags used for military purposes.

Tests showed that the protein of stored grains and soybeans kept better when these products were unground. A process was developed for making satisfactory crystallized sugar in quantity from sorgo cane. New information was obtained on quick freezing of poultry, on uses of egg albumen and on the proteins that might be obtained from feathers. Inspection, testing and specification services were provided on food and various products for the army and navy. Results of tests showed that immature wheat stored better and its flour baked better after treatment of the grain with ethylene gas. Processing of cucumbers was improved, the results opening possibilities for the better fermentative preservation of other vegetables.

Agricultural engineering studies brought useful results regarding farm buildings and heating equipment, improvement in machinery for the farm and processing plants, and paying uses for electricity on the farm. Specific examples are: Wind-pressure ventilation was found to have advantages in the storing of grain. A so-called "shell-cooled" improved potato storage was developed. As house insulation, cotton-seed hulls reduced fuel consumption. Studies cleared up some house heating and cooling difficulties. Discoveries regarding dusting nozzles and mixing and spreading properties of insecticides, fungicides and diluents promised more efficient and economical control of crop pests.

Additional developments of interest to farmers included better plow points, discovery that disks bevelled on the inside of the cutting edge pulled much easier than those bevelled on the outside, labour saving of 32% by preparing the seedbed for corn with a subsoil lister attachment instead of a plow, a new sugar-beet planter which required less seed and cut thinning costs, a beet topper, improved husking rolls for picker-huskers, equipment and methods for growing sweet potatoes that promised lower costs, improvements in machines for harvesting and putting up grass for silage, various new developments in flax harvesting and processing equipment, and further progress in improving cotton ginning and packaging.

The year's co-operative studies of paying farm uses for electricity brought results that included economical cooling of eggs, new facts on chick brooding, heating of hog farrowing houses, and warming of stock drinking water. (*See* also CHEMISTRY; CHEMURGY; INDUSTRIAL RESEARCH.) (H. G. K.)

Chemotherapy.

The following developments during 1941 may be largely attributed to war studies.

Interference with normal commerce produced a shortage or threatened shortage of imported drugs such as quinine, cod liver oil, ergot, digitalis, opium, henbane, essential oils, and intermediates used in the synthesis of potent drugs. Necessity served as the mother of invention, and American pharmaceutical firms learned to make their own intermediates. A large reserve stock of opium was placed in governmental vaults for safekeeping; steps were taken to grow increased amounts of digitalis, henbane and others in the U.S.A. and many drug formulas were changed to omit scarce essential oils. The only effective available substitutes for quinine in the treatment and prevention of malaria were atabrine and plasmochin. The drugs were formerly manufactured in the United States from intermediates imported from Germany and under German patents. The foreign patent control was severed by the U.S. government and methods for the preparation of the intermediates were perfected during the year. Similarly extensive investigation of the anti-malarial possibilities of various sulphonamide drugs was undertaken.

Substitutes for cod liver oil in the form of fish liver oils from other species were being increasingly developed. Of the essential constituents of cod liver oil, vitamin D is abundantly available through the irradiation of certain sterols; vitamin A has been synthesized but the process was in 1941 too costly to be commercially feasible. There was no curtailment of supplies of drugs for so-called "patent medicines" but it appeared that this might soon occur.

The sulphonamide group of drugs (sulphanilamide, sulphathiazole and sulphadiazine) was increasingly used both orally and locally in the treatment of contaminated wounds.

Mechanized warfare with its resulting large incidence of burns, particularly in aviators, stimulated research in the treatment of burns. The old tannic acid treatment of burns has largely given way to three new techniques of local treatment: The use of bacteriostatic, escharotic dyes such as gentian violet, brilliant green and neutral acriflavine either alone or in combination; the combination of tannic acid and silver nitrate; and the application of a protective covering of sulphadiazine by means of a spray.

The growing realization that many lives can be saved in peace as well as war if the effects of shock and haemorrhage can be more promptly counteracted brought certain developments: Portable plasma and serum kits for first-aid field use were developed.

Throughout the nation, stores of blood plasma and serum were being collected, desiccated and stored, and so-called "blood banks" were established in almost every large community. This, it may be said, constitutes the most important step forward in "first aid" in a quarter of a century.

The war stimulated research on drugs intended to combat fatigue and enhance endurance. There were many fantastic stories to the effect that the "blitzkrieg" successes of the Germans could be attributed in large part to the use of secret, stimulating drugs. There is no evidence of any truth in these tales. An "iron ration" kit from a German plane shot down over England was found to contain only such routine "stimulants" as chocolate, a beverage containing a small amount of caffeine and a small bottle of wine, alcohol content about 12%.

The widely publicized myth that gelatin and its principal amino acid, aminoacetic acid (glycine), are useful in counteracting fatigue was exploded. Amphetamine sulphate (benzedrine) appears to have some anti-fatigue effect but the danger of untoward action and collapse is too great to warrant its use except under carefully determined conditions.

The following contributions not primarily influenced by the war were made in 1941. Two new sulphonamide drugs acquired the stature of important drugs—sulphaguanidine for the treatment of intestinal tract infections, particularly bacillary dysentery; and sulphadiazine which appears to approach sulphapyridine in effectiveness in the treatment of pneumonia, and with the advantage that it does not have the same tendency to cause nausea and vomiting.

Certain protein derivatives such as para-amino benzoic acid present in the body and especially in high concentrations in pus were recognized as inhibitors of the sulphonamide drugs.

It has been known for a long time that certain bacteria exhibit antagonistic activities toward others. Based on this observation Rene J. Dubos of the Rockefeller Institute for Medical Research succeeded in isolating several species of aerobic sporulating bacilli from soil, sewage, manure and cheese which inhibited the activity of certain disease-producing organisms. From culture of these organisms he isolated two separate crystalline products, gramicidin which proved to be remarkably active against gram positive bacteria when applied to local infections, and tyrocidine which was found to be active against both gram positive and gram negative organisms in the test tube but thus far only active against pneumonia infections in mice. It is too early to determine what the practical significance of these findings will be.

English investigators found a harmless mould called pencillin which possesses a similar activity both in the test tube and in animals against pathogenic bacteria particularly those anaerobic organisms associated with gas gangrene infections. Up to Jan. 1, 1942, it had not been possible to grow and develop enough of this mould to make it available for general experimental use. Diethylstilbestrol (Stilbestrol), a synthetic substitute for the natural female sex hormone, was released for commercial distribution by the Federal Food and Drug administration.

The most outstanding example of a drug patent administered by a university, the insulin patent, expired on Dec. 23, 1941. Thus control of the strength, quality and purity of insulin passed from the University of Toronto. By enactment of a special amendment to the Food, Drug and Cosmetic act in record time in December congress made special provision for the continuation by the Food and Drug administration of the preshipment certification of insulin, a method of control which had previously proved so satisfactory in the hands of the University of Toronto.

Two new types of insulin with a prolonged duration of action, histone zinc insulin and globin zinc insulin, made their appearance during 1941. What advantages these possess over the previously available protamine zinc insulin is not yet clear.

There were indications that radioactive phosphorus may prove to be of unusual value, perhaps more so than any other agent now available, in the palliative treatment of the blood diseases, leucaemia and polycythemia.

Based on work done during 1941 there was a glimmer of hope that cancer cells exhibiting a selective affinity for certain radioactive elements might thus be successfully infiltrated and liquidated by direct atomic bombardment. This lead might turn out to be one of the most significant discoveries of all time or it could be just another failure to be added to the long list of false hopes in the treatment of cancer.

Immunization against tetanus (lockjaw) by means of a toxoid (a solution of detoxified toxin) proved practicable.

Phenylmercuric nitrate, aluminum hydroxide gel, cyclopropane, adrenal cortex extract, amylcaine hydrochloride, pernoston sodium, acetyl-beta-methylcholine, normal human serum and normal human plasma, anti-pneumococcic serum, types IV, V and XIV were among the important new drugs accepted during 1941 by the council on pharmacy and chemistry of the American Medical association. Chemurgy. War conditions during 1941 hastened advances in many departments of chemurgic activity. Shortages of metals brought sharply to attention the field of plastics as a reservoir of alternate materials. Actual and probable interruptions of shipping led many industries to look to American farms for raw materials hitherto obtained abroad. Munitions manufacture called for more intensive use of agricultural products, such as corn for the industrial alcohol consumed in smokeless powder manufacture.

Rubber.—The war with Japan focused special attention upon rubber, of which the U.S. had on hand only a year's supply for normal purposes. Government attention, which had been directed toward increasing production of tree rubber in South America, was quickly gained for guayule, the sagelike shrub of the southwestern desert. Lack of research into soil and cultural requirements was an immediate handicap, but arrangements were being made at the year-end for utilizing all the available seed, enough for 45,000 ac. The seed had been accumulated by private interests working for some years with guayule around Salinas, Calif. The rubber is found in both stalks and roots of the guayule shrub, the content increasing each year of the plant's growth up to seven or eight years. The potential acreage suitable is difficult to estimate because of lack of data on the adaptability of guayule to the somewhat varied conditions of the arid areas where it will be tried. Native to Mexico, the plant itself has various forms.

Efforts were being made in late December to obtain from Russia seeds of kok-sagyz, a latex-bearing plant established as a crop by the soviet government. Widespread interest was created when the National Farm Chemurgic council published the first complete report on this possibly very important new rubber source. Belonging to the dandelion family and greatly resembling the common American dandelion, kok-sagyz was first noticed in the early 1930s by Russian plant explorers in a remote region near the Chinese frontier. It has been found highly adaptable to several soils, but yields best on highly structural black soils. The Russians have grown it in both northern and southern latitudes, and in 1941 had several thousand acres in production. The latex is obtained from the fleshy roots. The annual yield is from 150 lb. to 200 lb. of crude rubber per acre, according to Dr. Paul J. Kolachov, who prepared the Farm Chemurgic council report.

Minor Crop Products.—Curtailment of transatlantic ship movements created a conspicuous shortage of many minor crop products, such as those used for flavouring, aromatic and pharmaceutical uses. Sage and coriander were among those successfully produced for the first time on a commercial scale, several hundred acres of sage having been grown under contract. A co-operative for production and sale of coriander was formed by farmers in Kentucky. A summary of information regarding 131 crops, mostly in these categories, deemed worthy of investigation for possible production in the United States, was published in November.

Established chemurgic enterprises in several instances increased production heavily in order to meet demands. The United States was pronounced substantially independent of foreign sources for cigarette paper, as a result of facilities for doubled capacity in the domestic industry, completed in the late summer. The raw material used is the threshed straw of seed flax, obtained principally in Minnesota and California. Production of cotton grown to the specifications of the automobile tire industry, first announced in 1940, rose from 3,000 bales in 1940 to nearly 15,000 bales in 1941.

Oils.—The soybean crop rose from around 90,000,000 bu. in 1940 (double the output of 1935) to approximately 107,000,000 bu. The percentage of soybean oil industrially utilized again increased. Pressure upon diminishing supplies of drying oils turned the surfacing industries to larger use of domestic production.

Threatened shortage impelled the department of agriculture to guarantee a price of three cents a pound to growers of castor beans in 11 Texas counties in order to build up a supply of available seed. Production of castor beans on experimental scales increased in Illinois, Mississippi and some other states. The more efficient tung oil orchards along the Gulf coast enjoyed a prosperous year.

Miscellaneous.—Lend-lease demands for U.S. dairy production reduced the available domestic supplies of casein at a time when casein use in fibres was growing more general. The industry had to turn to Argentine casein as its principal source of supply. A number of new fabrics using casein fibre was announced, and consumption in felts for hatmaking passed out of the novelty stage.

Two white potato starch factories were erected in Idaho and began using up cull potatoes from the 1942 crop. A newly formed Idaho Chemurgic committee backed the factories, and set up a study program looking toward new crops and new uses for the agriculture of the state.

The Nebraska legislature appropriated $25,000 for a comprehensive survey of possible new uses for farm products of the state, and of new crops. The survey conducted by the state university got under way in September with Dr. L. C. Christensen as director. Because of readily available markets for sweet potato food and feed products, little advance was made in sweet potato starch production. A new factory for utilizing sweet potatoes was opened at Denton, Tex., where research in this crop has been led at the state teachers' college by Prof. Gilbert C. Wilson.

The National Farm Chemurgic council, with its principal office at 50 West Broad Tower, Columbus, O., is the clearing house for chemurgic information.

Chess. Except for the soviet championship, international tournament chess was practically dead in Europe. Mikhail Botwinnik of Moscow regained his title of the U.S.S.R. in his usual masterful style. Gideon Stahlberg of Sweden won the accepted international tournament in Mar del Plata, Argentina, with Moishe Naidorf of Poland second.

Stahlberg broke the world's record for the number of boards played simultaneously and the time played. He played 400 separate games during 36 hr. 5 min., winning 364, losing 22 and drawing 14. He started playing at 10 P.M. on Friday, Aug. 29, and ended at 10:05 A.M. on Sunday, Aug. 31, without showing any signs of fatigue.

The world champion, Dr. Alexander Alekhine, whose residence is Lisbon, was reported to have visited Spain and Germany, but made no progress in arranging matches involving his title.

In the United States, chess thrived with renewed vigour, even though 1941 was the odd year in the series of biennial championship tournaments.

The national title held by Samuel Reshevsky of New York was contested for the first time under the auspices of the United States Chess federation. He was successful against the challenge of Israel A. Horowitz, champion of the erstwhile American Chess association. Reshevsky also competed in the New York state championship at Colgate university, losing to Reuben Fine, open champion of the United States federation. Their individual encounter was drawn.

Fine also won the championship tournament of the Marshall Chess club (N.Y.) and defended his title of open federation champion successfully in St. Louis when Herman Steiner of Los Angeles was runner-up. The only failure chalked up against Fine was his loss to Albert S. Pinkus, champion of the Manhattan Chess club (N.Y.), in the deciding match for the championship of the Chess league, won by the Marshall Chess club. The third of the series of invitation tournaments at Ventnor City, N.J., was won by Jacob Levin.

Intercollegiate Chess.—Yale repeated its triumph of the previous year in the H.Y.P.D. College Chess league, and Brooklyn college was also the successful defending champion in the Eastern Intercollegiate league. (J. B. P.)

CHIANG KAI-SHEK and Mme. Chiang in their home at Chungking in 1941. In the background is an autographed photograph of President Roosevelt, presented by Lauchlin Currie, Roosevelt's special envoy who arrived at Chungking in February

Chevrolet, Louis (? –1941), U.S. motor car pioneer, was born in La Chaux de Fonds, Switzerland. His family moved to France while he was still a boy. In 1900 he went to the United States, where he became famous as a racing driver. He piled up speed records and in 1905 when the phrase "mile-a-minute" represented dizzy speed, Chevrolet raced over a measured mile in 52.8 seconds at Sheepshead Bay, N.Y. In 1911 Chevrolet built and designed, with the co-operation of William C. Durant, the first Chevrolet car. Although the car pioneered many automotive developments, Chevrolet had little faith in it and sold out his holdings to Durant in 1911. Chevrolet, however, retained his interest in racing cars and built the Frontenac racer in 1911.

He died at his home in Detroit, June 6.

Chiang Kai-shek (*c.* 1886–), creator of China's modern army, chief of the ruling party, builder of the National government, and unifier and symbol of a new, progressive and united China, came from a humble family in Feng-haw, Chekiang province, and rose from poverty and hard-

ship by his own efforts. His ambition and patriotism incited him to study military science in the Chinese and Japanese military colleges from 1906–10. In 1910 Chiang became a loyal follower of Sun Yat-sen and in 1923 was sent to Russia to study soviet military methods and political institutions.

Nationally known as president of the Whampoa Military academy in 1924 and virtual master of Kwangtung province in 1925, Chiang appeared upon the world scene as generalissimo of the Nationalist northern expedition in 1926. Breaking relations with the communists, Chiang established the National government at Nanking in 1927. In December he married Mayling Soong and subsequently was converted to Methodism. Since 1927 Chiang has been continuously in power: by political manoeuvring he outlasted his opponents and in the name of the central government he crushed the rebellions of 1929–36. His ten years' campaign against the communists was brought to an end by the Sian incident of Dec. 1936.

After the outbreak of the war with Japan, Chiang's leadership had been unchallenged and his determination to resist Japan to the bitter end deepened the people's confidence in him. Early in 1941 Chiang declared that China had long ago cast its lot irretrievably with the democracies. Instead of resistance and reconstruction he began to enunciate victory and security as China's war aims. China's resistance and independence rest greatly on Chiang's life, activity and support, as he is chief of the Kuomintang and its youth corps, premier, president of the Supreme National Defense council, commander in chief of all military forces, chairman of the People's Political council and president of the combined national central banks in addition to other leading social, economic and educational posts. (*See* also CHINESE-JAPANESE WAR.)

Chicago. Second largest U.S. city, a port of entry and the county seat of Cook county, Ill., at the southwest corner of Lake Michigan, Chicago is the largest centre of rail traffic and of long-distance air routes. As a port, Chicago is mainly important because of a great tonnage of ore, fuel and fluxes for steel manufacturing, conveyed by lake ships, and for oil products conveyed by tanker barges and ships. It has access to the Gulf of Mexico via the Illinois waterway and the Mississippi river, and to the Atlantic via the St. Lawrence river and the Welland canal, but both routes can accommodate only small ships. The population of the city proper by the federal census of 1940 was 3,396,808, which included 1,686,648 males and 1,710,160 females. The white population numbered 3,115,379; nonwhite, 281,429. The population of the 1,119 sq.mi. comprising the metropolitan district was 4,499,126. As a result of increased employment, a slight rise in the birth rate was noted by the autumn of 1941 after a long decline which had lowered the average Chicago family to less than three persons, in contrast to a national average of 3·8 persons. The number of marriage licences issued in 1941 exceeded 48,000, nearly 4,000 in excess of the number issued in 1940—the previous all-time high record. The mayor (Jan. 1, 1942) was Edward J. Kelly.

War and munitions manufacture dominated all phases of Chicago life in 1941. At the close of the year, 1,285 concerns in the Chicago industrial area had received 5,777 military contracts, with a total value of $1,247,479,000. Of that amount, $386,052,000 was for construction of munitions plants, including the two government ordnance plants at Elwood and Kankakee, southeast of the city, which together cost approximately $95,000,000 and went into production near the end of the year. A private aviation engine plant at Melrose Park, erected at a cost of $41,867,000, began turning out motors at the end of 1941. Expansion of the steel industry in the Calumet river area south of the city involved expenditures of $135,000,000. Steel mills, in full blast throughout the year, operated at a rate of 109% of theoretical capacity in the last week of 1941. On the outbreak of war, recruiting offices in Chicago were crowded; there were 4,468 volunteer enlistments before the end of the year. Some 42,695 aliens were naturalized in 1941.

Increased employment reduced the number of cases handled by relief agencies to 103,781 in Dec. 1941. In addition to the local workers employed in war industries, 2,951 federal employees were transferred to Chicago from Washington, D.C., to relieve congestion in the capital. Despite the delay in completing the city's new subway system, caused by the needs of the arms industries for all available metals, Chicago's transit systems carried 27,000,000 more passengers in 1941 than in 1940.

Chicago's tentative budget for 1942 was set at $166,138,734. Subject to state legislative approval, usual expenditures of $3,000,000 for new bridges and streets were to be diverted to civilian defense measures. The civilian defense organization of the Chicago area was headed by Mayor Kelly.

Chicago was devoid of outstanding political events in 1941. The city council passed 3,883 ordinances, orders and resolutions —all routine and noncontroversial. On Dec. 4, 1941, Chicago witnessed the birth of a new morning newspaper, the *Chicago Sun,* founded by Marshall Field, grandson of the city's greatest merchant. The journal was launched 115 days after the decision to establish it.

Chicago's long fight against organized crime which totally eliminated gang murders in 1940, continued successfully in 1941. No city policeman was killed, but two policemen of the park commission were slain by outlaws. Police killed 12 criminals in acts of banditry, and private citizens slew five. A total of 1,030 convicted felons, including 12 women, were sent to state prisons, and two were executed. (L. H. L.)

Chicago, University of. An institution of higher education and research in Chicago, Ill. Founded in 1891, the university is privately endowed, co-educational and nonsectarian.

During the summer quarter of 1941, 4,157 students attended the university, of whom 2,103 were men and 2,054 were women. The total enrolment for the academic year 1940–41 was 11,897, an increase of 223 over the previous year. The home study (correspondence) department had a total enrolment of 3,704, which is exclusive of the totals given above. The university granted 1,581 degrees during the academic year; 514 were master's degrees and 174 were doctorates of philosophy.

The total funds of the university as of June 30, 1941, amounted to $128,781,040, an increase of $245,014 over the figure for the same date in 1940. These funds were divided into: endowment, $73,320,043; plant, $45,602,875; and other funds, $9,858,122.

The total income of the several divisions of the budget was $8,571,890, an increase of $66,904 over the income of the previous fiscal year. This total of budget income does not include income of auxiliary enterprises such as residence halls, commons, bookstores and student social facilities, nor restricted expendable funds. Including such income, the total current income for 1940–41 was $10,929,256. The total amount of gifts paid in for the year ending June 30, 1941, was $3,307,498.

Approximately 29,367 volumes were added to the university's libraries, bringing the total to 1,330,152.

During the academic year 1940–41 the university celebrated its 50th anniversary. At a special convocation on Sept. 29 climaxing the celebration, the university awarded 35 honorary degrees.

Ten thousand persons, including more than 400 delegates from colleges, universities, learned societies and foundations, attended the scientific and scholarly symposia and academic festival climaxing the year-long celebration.

Child Labour.

The spread of war conditions throughout the world made it everywhere difficult, and sometimes impossible, to hold social gains for children which had been built up over many years. With the intense pressure for defense production, child-labour standards tended to be lowered along with other labour standards. Nevertheless, it was significant that there was in many countries a growing recognition of the fact that if the civilization for which the fight was being waged was to survive in the end, there had to be special attention paid to protection of the growing generation from premature and excessive child labour.

United States.—The 1941 picture of the employment of children and youth in the United States was dominated by the growth of the national defense program and would be influenced to a still greater degree by the entrance of the United States into the war. The first effect on youth of increasing defense production was the opening up of many employment opportunities. Federally sponsored technical courses in high schools, colleges and evening schools trained thousands of youths for jobs in defense industries. But while much-needed work opportunity was given to unemployed youth, new child-labour problems were created relating to the employment of children under 16 who should remain in school and the employment under unfavourable conditions of minors of 16 and 17.

The Fair Labor Standards Act.—The most significant single happening of the year in the child-labour field was the decision of the United States supreme court on Feb. 3, 1941, in the case of The United States *v.* Darby Lumber co. *et al.*, upholding the constitutionality of the Fair Labor Standards act. This act through its child-labour provisions established in effect a basic minimum age of 16 for employment in industries producing goods shipped in interstate or foreign commerce and an 18-year minimum for employment in hazardous occupations. The unanimous decision of the court expressly overruled the case of Hammer *v.* Dagenhart which in 1918 had held the first federal child-labour law unconstitutional. This opinion not only marked a long step in social advance in the field of labour standards but removed all doubt as to the validity of child-labour regulation based on the power of congress to regulate interstate commerce. The establishment on a sound constitutional basis of a federal minimum child-labour standard was especially important in view of the rapid increase in the numbers of employed youth. In the administration of these child-labour provisions by the children's bureau of the United States department of labour, the agency charged with their enforcement, significant progress was made during the year 1941.

The co-operative relationships with state labour and education officials throughout the country in making certificates of age available as proof of age for minors employed in industries coming under the act were strengthened, thus building up the administration of state laws at the same time that the federal law was made more effective. The group of jurisdictions where state certificates were accepted as proof of age under the federal act was increased to 47 by the addition of Louisiana, Nevada and Puerto Rico.

The program of protection of minors from hazardous occupations carried on under the act was especially important in view of the increasing number of industrial accidents due to accelerated production and in view of mounting health hazards due to possibility of greater exposure to industrial poisons and of increased fatigue incident to speed-up and longer hours. Two hazardous occupations orders setting in effect a minimum age of 18 years were issued during 1941. The first covered all occupations in logging and all occupations in the operation of any sawmill, lath mill, shingle mill or cooperage-stock mill, with certain exceptions, and the second applied to occupations involved in the operation of power-driven woodworking machines. The research necessary as a basis for orders dealing with shipbuilding occupations and occupations involving exposure to radioactive substances was completed, and investigations were under way in the metal industries.

Inspections of establishments producing goods shipped in interstate commerce resulted in the removal of many children from employment contrary to the act, and the influence of these inspections and of the educational program carried on by the children's bureau extended far beyond the number of places of employment actually visited.

Extent and Character of Child Labour in the United States.—Preliminary estimates of the numbers of children and young persons employed, based on the 1940 census, were published in 1941. They showed in round numbers 4,800,000 boys and girls 14 and 15 years of age living in the United States, and 4,900,000 boys and girls of 16 and 17 years—increases of 4% and 5% respectively over 1930. Of this number, 255,336 14- and 15-year-old children and 1,047,316 16 and 17 years of age were "in the labour force" of the country at the time the census was taken, in the last week of March 1940. About two-thirds (890,976) of the boys and girls between 14 and 18 years of age in the 1940 "labour force" were reported as actually employed during the census week, including 213,104 children of 14 and 15 years and 677,872 of 16 and 17 years. No data showing the industries in which these young people were employed were available (Jan. 1, 1942).

A comparison between the number of youth recorded in 1940 as "in the labour force" and those recorded as "gainful workers" in 1930 indicated a striking decrease in child employment during the decade, particularly in the younger group 14 and 15 years of age. This decrease was to be expected, because during the depression years there had been fewer job opportunities for children as well as adults, and there had been also a definite advance in state and federal child-labour standards, especially toward establishing a 16-year minimum age for employment. (*See* also CENSUS.)

Though significant, these figures do not give a complete picture. In both 1930 and 1940 the fact that the census was taken in early spring inevitably resulted in omitting from the count many children employed in agriculture. Moreover, the 1940 census collected no data for working children under 14.

The child-labour picture, moreover, changed markedly after March 1940. Even then, mounting production under the program of national defense was decreasing unemployment and putting men to work. Any upswing in general employment tends to be accompanied by an increase in child labour. At first older workers were called upon but there was a sharp increase in employment of boys and girls 16 and 17 years of age, and, along with this, a rise was also occurring in the employment of children under 16. The younger children went chiefly into nonfactory jobs employment for the most part less regulated by law than work in the defense industries.

Legislation.—Forty-three of the 48 state legislatures met in regular session in 1941. Despite the fact that for the first time within recent years there were decided pressures to break down existing child-labour standards, and that many proposed advances in standards were defeated, some improvements were made. In Florida a complete revision of the child-labour law established a basic minimum age of 16 years for employment, and an 18-year minimum age for employment in many hazardous occupations. In Hawaii an important aid in administration was put into effect by increasing from 16 to 18 the age under which employment certificates are required. In New Jersey a new law regulating industrial home work requires employers to obtain permits to use home workers and to pay an annual graduated fee depending upon the number of workers employed, and also requires each home worker to obtain a certificate; no certificates are to be issued to minors under 16 years of age.

Great Britain.—By the latter half of 1940 it was recognized that the excessive lengthening of hours for all factory workers, involving relaxation of all control of hours of young persons and women, which had occurred under the extreme pressures consequent on the fall of France in May, was a short-sighted and uneconomical policy, in that the abnormal strain of long hours resulted in a lowered production level, increased lost time from sickness, exhaustion and other causes, as well as a reduction in hourly output. Working hours were shortened, and the ministry of labour announced that the provisions of the Factories act limiting hours of work of women and young persons would be fully enforced, subject only to emergency orders of the secretary of state or of the ministry of labour and national service.

The impact of war conditions in many localities lowered compulsory-school-attendance standards and increased employment of children of school age on farms and in stores. During 1941, however, efforts to make schools available and to keep children in attendance were intensified.

Canada.—In Canada, employment expanded during 1941, and it was reported that in Ontario, the most important manufacturing province of the dominion, the number of children 14 and 15 years of age exempted from school attendance for employment increased. It was, therefore, significant that legislative advances were made in the field of school attendance laws. In New Brunswick, where school attendance previously had been compulsory only in a few towns, a law effective July 1, 1941, made attendance up to 14 years compulsory throughout the province and prohibited the employment of a child of school age during school hours unless he had completed the eighth grade, or unless, in the opinion of the school inspector, he should be exempted from further attendance. In Prince Edward island and Alberta compulsory school attendance standards were raised.

Union of South Africa.—In the Union of South Africa a law put into effect Sept. 1, 1941, raised the basic minimum age for employment in factories from 14 to 15 years. The law also contained measures for the better protection of the health of workers of all ages.

India.—The Bombay Shops and Establishments act which went into effect in Nov. 1940 prohibited the employment of children under 12 in shops, fixed closing hours and limited hours of work. It was estimated that more than 2,000 children under 12 years of age who had been previously employed in restaurants were eliminated from such employment. A similar act received the assent of the governor of the Province of Sind on Dec. 19, 1940.

British Colonies and Dependencies.—An ordinance put into effect in British Honduras in Nov. 1940 established a basic minimum age of 14 for employment of children, with certain exceptions for children between 12 and 14 years of age employed outside school hours. In the West Indian Colony of St. Vincent (Windward Islands), an ordinance of Sept. 17, 1940, prohibited the employment of children under 14 years of age, except in light agricultural or horticultural work for parents on the family farm outside school hours. In Northern Rhodesia (Africa), a general minimum age of 12 years was fixed in the latter part of 1940 for admission to employment.

Continental Europe.—Because of war urgencies prevailing in the greater part of continental Europe, little information in regard to labour conditions relating to young persons was available.

Germany.—An order of the minister of labour dated Jan. 11, 1941, called attention to existing provisions prohibiting the employment of women in unhealthful occupations and prescribing that exemptions to these regulations should be granted only in individual cases where particularly strong grounds existed and where special provision was made for protection against health risks. A previous order issued Sept. 13, 1940, had prohibited employment of both girls and boys under 18 at furnaces and on grinding work of any kind and required periodical physical examinations of all workers employed in certain hazardous occupations, including the production of mixtures with a lead content.

Switzerland.—A Swiss federal act of Dec. 12, 1940, regulating industrial home work, required the posting of schedules of rates of remuneration, prohibited children under 15 years of age from employment as home workers on their own account, and prescribed conditions for giving out home work aimed to prevent employment at night or on Sundays and public holidays.

Brazil.—The outstanding legislation for the protection of working children in South America enacted during 1941 was the child-labour law of Brazil, approved on Sept. 13, 1941, to go into effect Jan. 1, 1942.

Federal regulation of child labour in Brazil was begun under a law passed in 1927 and continued by a decree of 1932 and by the Federal Constitution of 1937, which approved the principle of the minimum age of 14 for all employment.

The 1941 law was the result of the report of the special commission appointed by the government in 1940 to study the possibility of bringing the child-labour law into line with the draft conventions approved by the conferences of the International Labour organization. The basic minimum age for employment remained 14 years, but the law made no exemptions for economic need. It applied both to industrial occupations and to nonindustrial occupations other than agriculture, exempting domestic service and workshops which employed exclusively members of the child's family and in which the child was under the direction of parent or guardian. Agricultural work was directly covered by its provisions only when industrial processes were used, but subsequent regulations were to determine whether or not the law was to be applied to other kinds of farm work. The law also set up new regulations for the work of children in street trades.

An outstanding advance in administrative procedure was the requirement of an employment certificate (*carteira de trabalho do menor*) for all children between 14 and 18 years of age going to work. To obtain a certificate the child had to present to the issuing officer proof of age, the parent's authorization for his employment, physician's certificate of physical fitness, proof of literacy, his photograph and a statement from the employer as to the kind of work that the child was to do.

The law was to be enforced in the federal district by the bureau of labour, national department of labour, industry and commerce, elsewhere by the regional offices of that department, or in the absence of such offices, by especially designated officials.

International Labour Office.—The International Labour office continued to carry on its work in Montreal, Canada, and held its first conference since 1939 in New York city, in Oct.-Nov. 1941. The conference did not undertake the adoption of conventions, but planned discussions to be utilized as a basis for the future consideration of international labour treaties. This meeting constituted a significant step in the framing of future social policy in labour matters through free co-operative international effort. Successful development of collaboration between employers' and workers' organizations and between these groups and government was emphasized as an indispensable condition of the continued existence of the democratic way of life.

(B. Mc.)

Children's Books.

The children's books of 1941 showed an increased interest in the history and in the ideals of the United States, evidenced by such biographies: *Walt Whitman* by Babette Deutsch, Howard Fast's *Haym Salomon* and Jeanette Eaton's *Narcissa Whitman;* books of historical interest: Genevieve Foster's *George Washington's World,* Carolyn Bailey's *Homespun Playdays* and Maud and Miska Petersham's *An American ABC;* and books descriptive of the United States: Ann Clark's *In My Mother's House* with illustrations by Velino Herrera, Holling C. Holling's *Paddle-to-the-Sea,* Marshall McClintock's *The Story of the Mississippi* and Mable Pyne's *The Little Geography of the United States.*

Stories of other times in the United States were *The Crimson Shawl* by Florence Choate and Elizabeth Curtis, *Coat for a Soldier* by Florence Updegraff, *Indian Captive* by Lois Lenski, *The Matchlock Gun* by Walter Edmonds, *Nathaniel's Witch* by Katharine Gibson, *John of Pudding Lane* by Mabel Hunt, *Delecta Ann* by Myna Lockwood, *Little Town on the Prairie* by Laura Wilder, *The Middle Button* by Kathryn Worth.

Other good stories were *The Mofats* by Eleanor Estes, *The Saturdays* by Elizabeth Enright, *Lottie's Valentine* by Katherine Eyre, *Captain Kidd's Cow* by Phil Stong, *Tag-along Tooloo* by Frances Sayers, *Whispering Girl* by Florence Means, *Canthook Country* by Merlin Ames, *World Series* by John Tunis, *Blueberry Mountain* by Stephen Meader, *The Melforts Go to Sea* by Geraldine Pederson-Krag, *A 'Prentice of Old London* by Janet Marsh.

Interest in South America brought *The Pageant of South America* by Anne Peck, Richard Gill and Helen Hoke's *The Story of the Other America,* Alice Dalgliesh's *Wings Around South America,* and Delia Goetz's *Neighbors to the South.*

Books about Mexico included Elizabeth Tarshis's *The Village That Learned to Read,* Ruth Sawyer's *The Least One* and a collection of folk tales by Dan Storm called *Picture Tales from Mexico.*

The war brought such books as Creighton Peet's *Defending America* and Paul Brown's *Insignia of the Services,* numerous books about aeroplanes and fighting ships, and a number of books about refugee children.

Among many biographies were Elliott Arnold's *Finlandia* (Sibelius), John Erskine's *Song Without Words* (Mendelssohn), Madeleine Goss's *Unfinished Symphony* (Schubert), Claire Purdy's *Song of the North* (Grieg), Laura Benét's *Young Edgar Allan Poe,* Alvin Harlow's *Joel Chandler Harris,* Jeannette Nolan's *James Whitcomb Riley* and Howard Fast's *Lord Baden-Powell.*

Picture books included Robert McCloskey's *Make Way for Ducklings,* Wanda Gág's *Nothing At All,* William Du Bois's *The Flying Locomotive,* and the d'Aulaire *Leif the Lucky.* Virginia Burton's lively *Calico, the Wonder Horse* was a book of 1941 which should begin a movement to laugh the ubiquitous "comic books" out of existence.

Science books included Harriet Huntington's *Let's Go to the Seashore,* Henry Kane's *The Tale of the Bullfrog* and Harry Hoogstraal's *Insects and Their Stories.* Other good informational books were Harold Keith's *Sports and Games,* Anne White's *Lost Worlds,* Nina Jordan's *American Costume Dolls.*

Some additions to imaginative literature for children were Anne Malcolmson's *Yankee Doodle Cousins,* James Bowman's *Winabojo, Master of Life,* Mabel Beling's *The Wicked Goldsmith,* Ruth Sawyer's *The Long Christmas,* Dorothy Lathrop's *The Colt from Moon Mountain,* with new retellings of *Beowulf* and *Peer Gynt* by E. V. Sandys, and a new edition of Esther Shephard's *Paul Bunyan* with illustrations by Rockwell Kent. Poetry was best represented by Louis Untermeyer's *Stars to Steer By.*

The Junior Bookshelf ceased regular publication with the July 1941 issue because of the almost total lack of new children's books in England, but with the promise of further issues when-

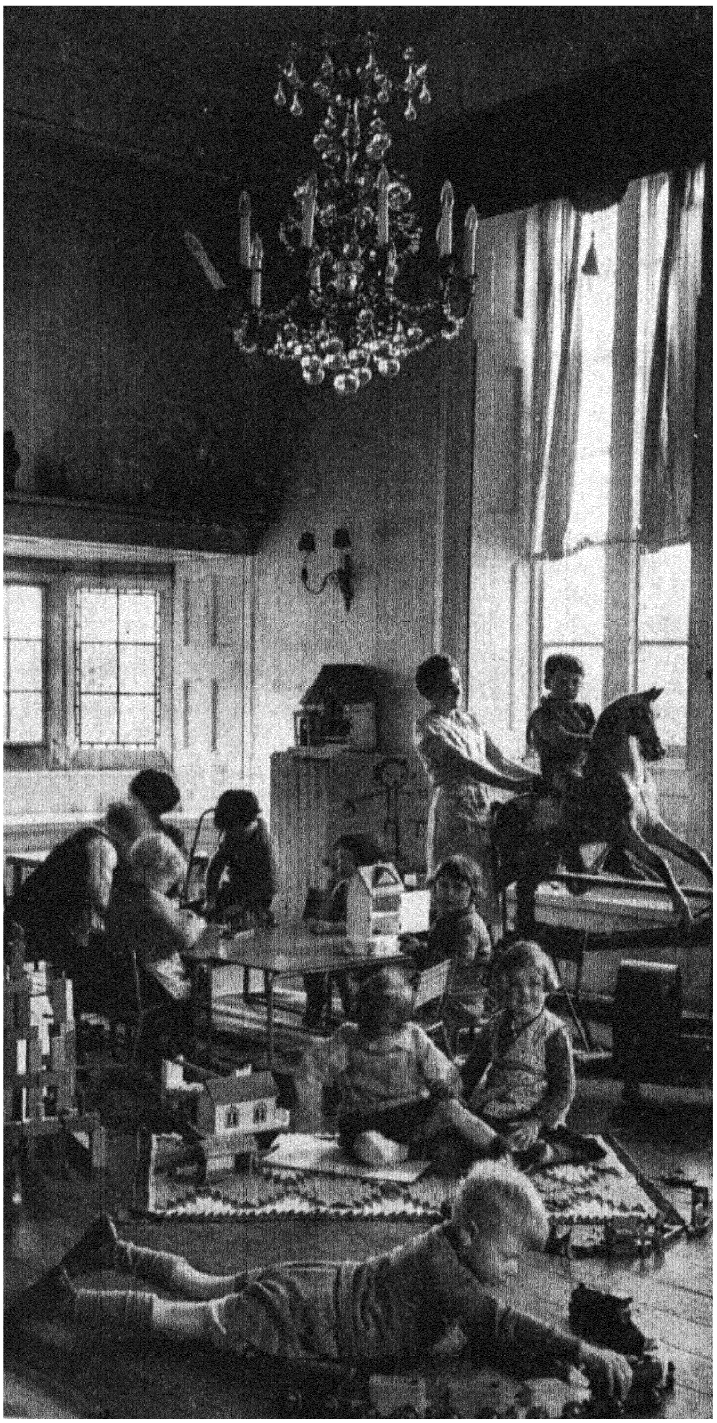
ever opportunity might permit.

More than 900 books for children were published in the United States in 1941, but all signs pointed to a decrease in this number in 1942. (*See* also LITERARY PRIZES; PUBLISHING [BOOK].)

(S. AN.)

Children's Bureau, United States: *see* CHILD LABOUR; CHILD WELFARE; JUVENILE DELINQUENCY.

Child Welfare. The status of children in 1941, with the destruction and privations of the war prevailing in so many lands, differed greatly in the various parts of the world. In Europe, original proving ground of child-welfare work, the disorganization of normal protective work for children continued, although, in Great Britain at least, many prewar services for children were maintained. In the British dominions, where improved child health was one of the chief defense aims, determined efforts were made to maintain standards. In Latin America, with the growing realization of the social value of child welfare, increasing stress was laid on better protection of the child. In the United States plans were made and foundations laid for a defense program of child health and welfare which merged at the year's end into a wartime program for child protection.



AUTHOR J. B. PRIESTLEY ran a nursery school for evacuated British children in 1941 at a former country estate in Herefordshire

United States.—Extensive migration to military and industrial defense areas affected both the children in migrant families and the children living in areas where population increased more rapidly than community facilities and services. The rapid completion of public housing projects during the fall of 1941 improved the housing situation in some areas, but many families were still using overcrowded and unsuitable dwellings and trailer camps. Because state and local governments were not able, with available funds, to expand adequately health and social services and hospital facilities needed especially for mothers and children living under unstable community conditions, federal funds were appropriated for community facilities in defense areas. Of the first $150,000,000 appropriated, about 30% of the amount so far allotted was for schools.

Responsibility for planning for the protection of the civilian population was placed by the president with the Office of Defense Health and Welfare Services and the Office of Civilian Defense (*q.v.*). In co-operation with these agencies the children's bureau of the United States department of labor, the Office of Education of the Federal Security agency and other federal agencies dealing with children participated in making plans for child protection. Among the programs launched or in preparation in 1941 in which provision for children and youth was an important factor were the nutrition program stimulated by the National Nutrition Conference for Defense May 26–28, 1941; programs for recreation and social protection in military and industrial defense areas; provision of day-care for children of employed mothers; training of volunteers for community service including special programs for children; and plans for possible evacuation of children and mothers from areas that might be affected by war emergencies. Upon state and local health, welfare and school officials fell the immediate responsibility of working out with state and local defense councils plans for improving living conditions for families in local defense areas.

Under the guidance of the National Citizens Committee of the White House Conference on Children in a Democracy follow-up conferences were held in several states in 1941. The first Puerto Rican Child congress was held Dec. 4–7, 1941. State and local organizations concerned with the welfare of children continued to study the recommendations of the White House Conference on Children in a Democracy in order to strengthen community programs for children.

Vital statistics for 1940 issued by the United States bureau of the census recorded 2,360,399 live births and a birth rate of 17.9 per 1,000 population, continuing the upward trend in the birth rate since the low point (16.5) in 1933. Further declines occurred in maternal and infant mortality rates. The maternal mortality rate for 1940 was 38 per 10,000 live births, compared with a rate of 40 in 1939 and 59 in 1934. The infant mortality rate for 1940 was 47 per 1,000 live births, compared with 48 in 1939 and 60 in 1934. Figures so far available for 1941 indicated that in general conditions were favourable for the health of mothers and children, although in the eastern and southern states there was a serious epidemic of poliomyelitis with more than 8,500 cases reported. (*See* also BIRTH STATISTICS; CENSUS, 1940; INFANT MORTALITY.)

The state health officers who administer maternal and child-health programs with the aid of federal funds reported, for the year ended June 30, 1941, increased attendance at prenatal clinics and child-health conferences; greater emphasis on nutrition; the provision in additional areas of home-delivery-nursing service and nurse-midwife service; and increased amounts spent for hospitalization of mothers and children. Federal funds for maternal and child-health services expended by state health agencies under plans approved by the children's bureau during the fiscal year ended June 30, 1941, totalled $5,336,019. The federal grants matched in part with state and local funds brought the combined program close to $9,000,000 for the fiscal year 1941 and would bring it to more than $11,000,000 for 1942. Many local defense areas still lacked the basic essentials for conducting a maternal and child-health program, namely, a full-time local health unit and a staff of public-health nurses. Difficulty was being experienced in expanding maternal and child-health services and in retaining doctors and nurses for civilian service because of the medical needs of the

armed forces.

A total of 307,478 crippled children were listed on state crippled children's registers on June 30, 1941, an increase of 15% over the preceding year. Twelve states and Puerto Rico reported fewer than 5 children per 1,000 under 21 years of age so registered as compared with 7 states that reported 10 to 12 registered, an indication that the process of locating crippled children is not yet complete. Federal grants for services for crippled children made through the children's bureau to the state crippled children's agencies totalled $3,919,837 in the year ended June 30, 1941. Federal funds for services for crippled children expended by the state crippled children's agencies under plans approved by the children's bureau amounted to $3,777,113 for the fiscal year ended June 30, 1941. Together with state funds that matched the federal funds in part the expenditures reached approximately $6,700,000 for the fiscal year 1941 and were expected to reach about $7,500,000 for 1942. These funds were used for locating crippled children and for providing medical and surgical care, diagnostic and treatment service, hospitalization and aftercare services.

The federal-state program for child-welfare services administered by the children's bureau provided for local child-welfare workers paid in whole or in part from federal funds in 533 counties or local areas, mostly rural, and for supervisory service in state welfare departments during the year ended June 30, 1941. Federal funds expended by the state welfare agencies for this purpose totalled $1,523,820. Great need for child-welfare service became evident in military and industrial defense areas because of family insecurity, juvenile delinquency and other problems, but limited funds made it possible for the state welfare departments to provide workers in only 73 local defense areas in their plans for the fiscal year 1941-42.

During 1941 Illinois and Texas were added to the states receiving federal grants for aid to dependent children, administered by the Social Security board of the Federal Security agency. Forty-four states, the District of Columbia and Hawaii were receiving such grants at the close of 1941. During Sept. 1941 payments were made for 926,149 children in 383,796 families. The average monthly benefit per family was $32.73 representing a range from $13.38 in Arkansas to $55.41 in Massachusetts.

Benefits for surviving children under old-age and survivors' insurance, also administered by the Social Security board, first became payable during 1940. During the first six months of 1941 the number of children awarded monthly benefits totalled 38,618, and the monthly benefits reached $471,020.

A number of states enacted laws for the protection of children during 1941. New adoption laws or significant revisions of existing laws were enacted in five states. Social-work procedures in court actions to establish the paternity of a child were authorized in two states. The supervisory responsibility of the state department for children away from their homes was extended in three states. Significant changes in the juvenile-court laws or in the organization of juvenile courts were authorized in three states. Commissions for study of problems of youthful offenders or juvenile delinquents or for revision of child-welfare laws were created in four states.

The birth-registration laws of more than one-fourth of the states were revised completely or were amended to include new or improved provisions relating to protection of records from inspection, delayed or altered registrations, registration of foundlings and changes in birth records on adoption or legitimation of a child. Following the precedent established by 19 states, several states enacted laws requiring physicians attending pregnant women to arrange for a serological test for syphilis; and six states were added to the group of 20 states requiring a physical examination and serological tests for syphilis of all applicants for a marriage licence. (*See* also MARRIAGE AND DIVORCE.)

The children's bureau maintained close correspondence with officials and others responsible for services for children in the other American republics. The children's bureau participated actively in the program of the Interdepartmental Committee on Cooperation with the American Republics. Consultation service was given on request to the National Children's bureau of Brazil during 1941 and staff members visited also Argentina, Uruguay, Mexico and Central America. A member of the bureau staff was being assigned to serve as child-welfare consultant to the American International Institute for the Protection of Childhood, which had headquarters at Montevideo, Uruguay. Another representative was being assigned, on request, to give consultation service to the government of Paraguay in the development of work for children.

The children's bureau assisted in developing plans for the visit to the United States, in June 1941, of directors of 15 schools of social work in the other American republics and assisted in making scholarships available to graduates of these schools for study in schools of social work in the United States in 1942.

On April 1, 1941, an act of congress was approved appropriating funds for holding the Eighth Pan American Child congress in the United States. The congress was planned to be held May 2–9, 1942. The chief of the children's bureau was appointed chairman of the United States organizing committee for the congress.

Latin America.—Progress was noted in Latin America in the development of systems of social insurance which benefit workers and their families. In Panama, by a law of March 21, 1941, social insurance was made compulsory for government employees and large groups of private workers. Bills for social insurance were introduced in the national legislatures of Bolivia, Colombia and Costa Rica; in Brazil a committee was preparing a plan for sickness insurance; in Mexico a committee was drafting a general social-insurance bill; and in Chile, where a social-insurance law had been in effect since 1924, a government bill for a complete reform of the system was introduced on June 14, 1941.

Improvement in nutrition, a comparatively new subject on the social-welfare program of the Latin American countries, received much attention. In Bolivia, a bureau of nutrition was organized, and in Brazil, a social-insurance nutrition service for persons covered by social insurance and their families. The "first national dining room," which served also as a centre of education in nutrition, was opened in Mexico City in Nov. 1941, and three more were to be opened.

A national board of maternal and child welfare began to function in Jan. 1941 in the Dominican Republic for the purpose of improving health services for mothers and children.

In Mexico, where very little use had been made of foster-home placement of children, the advantages of this method of child care were being recognized, and in Oct. 1941 the department of public welfare announced a plan for the transfer of young children from a public institution in Mexico City to foster homes, beginning early in 1942.

In the federal district of Mexico the legislation on juvenile courts was amended and codified by a law of April 27, 1941. Each juvenile court was to consist of three members: a lawyer, a physician and a teacher; stress was laid on the individual treatment of each case, and on prevention and rehabilitation.

In Peru the education law of 1941, repealing a law of 1920, made school attendance compulsory for children 7 to 16 years of age unless the child received earlier a certificate of elementary instruction. In this law many new measures were prescribed for the care of school children's health, such as regular medical examinations, dental services and sanitary inspection of schools. The law pointed out the urgent need of schools for Indians and for rural inhabitants, and for an educational program, even in the primary schools, which would meet the every-day needs of the people. Registration of all agencies engaged in maternal and child-welfare work in Peru was ordered by a presidential decree of Aug. 4, 1941.

Brazil enacted a new child-labour law, which marked a notable advance in standards of child employment. (*See* CHILD LABOUR.)

Great Britain.—In Great Britain health services for children were maintained and in some ways strengthened even under war conditions. For the 2,250,000 mothers and children who were evacuated from bombed cities to areas of relative safety during the first 18 months of the war, the public authorities were able to provide most of the health services of normal times, including school medical services, child-health clinics, public-health-nursing services, midwife services and maternity care in hospitals. Welfare officers (social workers) were added to local health department staffs in many of the provinces. Steps were also taken toward introducing or expanding in the reception areas nursery education, child-guidance work, community social work and communal feeding. In a report issued in June 1941 the home department estimated that the increase in indictable offenses committed by children under 14 during the first year of the war amounted to 41% and described the program of varied social and recreative facilities for young people developed to offset the effect of absence of parents from the home, interrupted school attendance and the temptation to spend unwisely the relatively high wages paid to boys in war industries. (*See* also CRIME.)

British Dominions.—In Australia, under the child endowment act effective July 1, 1941, an allowance of five shillings was paid weekly for each child under 16 in the family, except the first, irrespective of the amount of the family's income. In New Zealand new health benefits were introduced in 1941, available to all residents covered by the Social Security act of 1938, irrespective of economic status, race or nationality. These benefits consisted of attendance by a physician (except in specified cases), out-patient treatment in hospitals and provision of medicines and other pharmaceutical materials.

Continental Europe.—From what little information was available from Europe it appeared that few new laws in the field of child welfare were enacted. In Spain a law of Dec. 30, 1940, amended and consolidated the previous laws on juvenile courts, giving them jurisdiction in cases of children under 16 accused of crimes or misdemeanours, those who were prostitutes, or vagrants, or who presented other serious problems of behaviour, and those who were neglected or mistreated by their parents or guardians. Spain, following the example of Germany and Italy, also began to make loans from the national treasury to eligible newly married couples. These loans were repayable in monthly instalments of 1%; part of the loan was cancelled on the birth of each child. On Oct. 20, 1941, Italy, following the precedent of Germany, ordered the reporting of births of deformed children and of those with defects likely to cause disability. (*See* also SOCIAL SECURITY.)

Eliot, M.D. (Children's Bureau, U.S. Dept. of Labor, Washington, 1942); *The Child, Monthly Bulletin* (Children's Bureau, U.S. Dept. of Labor). (K. F. L.)

Chile, a republic on the west coast of South America, extending some 2,800 mi. from just within the tropics to the subarctic south. Area, 289,776 sq.mi.; population (Nov. 28, 1940 census), 5,023,539; capital, Santiago; religion, Roman Catholic; acting president, Jerónimo Méndez (succeeding President Pedro Aguirre Cerda [*q.v.*], deceased Nov. 25, 1941).

Population.—The Nov. 28, 1940 census, details of which were made public in 1941, showed a population of 639,546 for Santiago, or 943,669 including suburbs. The 20 other principal cities (not

including suburbs) were: Valparaiso (215,614); Concepción (92,364); Temuco (84,696); Viña del Mar (70,013); Osorno (62,106); Chillán (61,535); Talca (56,735); Los Angeles (52,259); Antofagasta (51,107); Valdivia (49,481); Puerto Montt (44,024); Talcahuano (41,536); Iquique (39,282); Rancagua (38,423); Linares (36,403); Curicó (35,270); La Serena (35,055); Nueva Imperial (33,361); Magallanes (Punta Arenas), southernmost city in the world (33,134); Cauquenes (33,116). Population figures are for municipalities, which usually embrace considerably larger areas than do conventional Anglo-Saxon cities. More than 3,000,000 of the population was in the central section of the country, less than 600,000 in the four northernmost provinces, and nearly a million and a third in southern Chile (south of the Bio-Bio river). Of these last, only 167,533 were in the three southernmost provinces of Chiloé, Aysen and Magallanes. The net increase in the country's population between 1930 and 1940 was 736,094, or 16·9%.

History.—As the Chilean popular front government of Pres. Pedro Aguirre Cerda entered its third year of power, the Chilean political scene was marked by uncertainties; these continued to dominate the picture throughout 1941. With the formal secession of the Socialists (Jan. 7), after a bitter feud with the communist party, the popular front seemed on the verge of complete collapse. Disregarding possible political effects, Pres. Aguirre vetoed a bill passed by the rightist-controlled congress outlawing the communist party. In the congressional elections of March 2, held under military supervision, the reorganized popular front parties took 71 of the 147 lower house and 19 of the 45 senate seats, while the parties of the right took 61 and 21 seats respectively. Balance of power was thus held by the socialists, with 15 deputies and 5 senators. Among those elected were 17 communist deputies and 4 communist senators (the largest number in Chilean history). The "Popular Socialist Vanguard," formerly the "Chilean nazi party," elected only two, including its leader, Jorge González von Marées. In May, two days before formal opening of the new congress, an organized Vanguardist mob attacked the radical party convention, killing one delegate. Forty-two Vanguardists were arrested, and the government attempted unsuccessfully to place González himself in an insane asylum.

In the new congress, attempts to expel communist members failed by close votes, 71–66 in the chamber of deputies, 20–16 in the senate. Later, after entry of the U.S.S.R. into the war against Hitler, the communist-socialist feud was patched up. Congress's main efforts were directed toward national defense, for which 4,000,000,000 pesos were appropriated. The 1942 budget, 18% more than in 1941, was the largest in the history of Chile. Other legislation included an act for complete control of exports under wartime conditions. Attempts to outlaw naziism and fascism failed of passage in May, as did renewed efforts in August and September.

Cabinet changes were frequent throughout the year. After several months of acrimonious disputes with his own party (the radicals, largest single Chilean political group), Interior Minister Arturo Olavarría, advocate of a rigid neutrality policy, resigned and was succeeded by Dr. Leónidas Guzmán, cancer expert and honorary president of the anti-nazi and fascist league. With the serious illness of Pres. Aguirre in November, Dr. Jerónimo Méndez, little-known president ("national chairman") of the radical party, was named minister of the interior (ranking cabinet position); then, as Pres. Aguirre withdrew temporarily, Méndez became acting president under constitutional procedure. On Pres. Aguirre's death (Nov. 25), Méndez set new presidential elections for Feb. 2, 1942, in conformity with constitutional requirements. The remainder of the year was marked by confused political manoeuvrings and coalition attempts in preparation for the election campaign itself. The principal candidates were Juan Antonio Ríos, a radical with rightist leanings, Oscar Schnake, socialist party leader, regarded by many as perhaps the most capable of all Chilean public figures, Eduardo Cruz Coke, eminent physician and a conservative, with strong personal popularity beyond his own party ranks and General Carlos Ibáñez, former president-dictator (1926–31) and later a consort of nazi and fascist elements.

Especially in the second half of the year, nazi propaganda and other activities were pronounced. After the Vanguardists' obvious failure to attract popular support, Germany, as a good-will gesture, made a gift to Chile of the German training-ship "Priwall," which had been tied up in Valparaiso since 1939. Later, rumours of a nazi-inspired putsch were common, especially after discovery of several secret arms caches in southern Chile (the area of German colonization). Many arrests followed, and an extensive investigation disclosed existence of semi-military organizations said to include up to 200,000 members, chiefly persons of German extraction, with at least 10,000 regular financial contributors, and a plot reputedly co-ordinated with a similar movement in Argentina.

The government's foreign policy was one of rigid, if not blind, neutrality. Co-operation was given to general western hemisphere defense plans, though usually as independent action. Thus, prior to similar United States and other American action, the Chilean government took over three Danish ships on Feb. 16 (and later, two more), on the ground of "public necessity" in view of the acute shortage of shipping facilities. Five German ships, in ports of Chile since 1939, were permitted to escape, however.

A government ban on "all outdoor public meetings and parades in favour of any belligerent country," imposed in June, was followed on Aug. 9 by prohibition of all propaganda by radio. Earlier, in January, formal permission had been granted for public showing of an emasculated edition of the film "The Great Dictator" and subsequently, of the German propaganda film "Victory in the West." In June, however, showing of "Pastor Hall" was forbidden, and on July 9, all "ideological films" were prohibited, although restrictions were modified later.

Several important agreements with other American countries were effected during the year, including trade pacts with Mexico, Brazil and Colombia, and non-aggression treaties with Bolivia and Peru. The latter included an understanding for joint action in coast defense. Chile likewise acted as an arbiter in the Costa Rica-Panama boundary dispute, and began formal diplomatic relations with Canada.

Through most of the year rumours were rife of an impending agreement with the United States for use of Chilean facilities as bases for western hemisphere defense, but without concrete result. Upon formal entry of the United States into World War II, Chile declared her intention to accord that country all non-belligerent rights and belatedly ratified the Havana pacts of July 1940. At the same time, the government took the initiative in calling a general conference of the American republics to meet in Rio de Janeiro in Jan. 1942, and began negotiations with Argentina for modification of the Argentine-Chilean treaty of 1881 under which the Strait of Magellan was demilitarized.

Among the more important internal effects of World War II was an acute shortage of fuels, both oil and coal, which seriously hampered industrial activity. Shortage of shipping facilities gave rise to organized salvaging of wrecked ships in Magellan strait and adjacent waters for ocean service. Prices of some Chilean mineral products were greatly stimulated by heavy Japanese buying during the year. Difficulties in obtaining direly needed imports from the United States caused much irritation, but U.S. action, in December, in rushing a large quantity of stored tin-plate to Chile for use in canning gave promise of a changed policy.

Economically, Chile's problems revolved around foreign trade

and its disruption. The most serious questions were acquisition of new markets and new sources of supply to replace those lost through the spread of war, and maintenance of shipping facilities. On May 8, a foreign trade institute was established "to harmonize commercial relations" with countries with whom Chile had had unfavourable trade balances. Efforts, too, were made to attract new capital to the country. A national development corporation, financed in part through a $22,000,000 credit from the United States Export-Import bank, was set up. Under its direction a public works program of highways, railways, irrigation projects and soil reclamation was launched, and aid was granted for a gold and copper smelter, a mercury recovery plant, a manganese corporation and several other projects.

In keeping with the established policy of state ownership, the government expropriated the properties of the British-owned Nitrate railways, including some 350 mi. of rail lines in the extreme north, with indemnity to be determined later. Following a serious streetcar strike in Santiago in May, negotiations were entered into with the United States corporation owning the property.

Education.—Primary education is free, non-sectarian and compulsory. Official reports for 1939 showed 3,522 government and 1,129 private schools with enrolments of 480,678 and 121,759 respectively; 86 public and 173 private secondary schools with 44,174 students; 151 special schools (including agricultural, vocational, industrial, commercial and normal), with 32,176 pupils. The National university, at Santiago, had 4,774 students, the Catholic university (Santiago), Santa Maria university (Valparaiso) and the University of Concepción together had 1,674. The National university summer session held each January, is a mecca for students from all parts of America.

Defense.—The Chilean army, regarded as one of South America's best, had about 1,500 officers, 20,000 regular troops, 15,000 one-year conscripts and a trained reserve of 200,000 men in 1941. The navy included one battleship (built in 1915), 3 cruisers, 8 destroyers and 9 submarines (the last being the oldest in active service anywhere in the world). An air force of several hundred planes was being greatly augmented under 1941 defense plans. In 1941 the congress made an extraordinary appropriation of 4,000,000,000 pesos (approx. $135,000,000) for national defense.

Finance.—The monetary unit is the peso, valued at approximately 3⅓ cents U.S. The gold peso, used to report foreign trade, was valued at 20.61 cents in 1941. Government revenues for 1940 totalled 2,052,000,000 pesos, expenditures 2,202,000,000 pesos. The 1941 budget was presumed to balance at 2,194,294,000 pesos, but by July 31, aside from extraordinary defense outlays, expenditures exceeded revenues by 154,589,000 pesos. The 1942 budget, an all-time high, provided expenditures of 2,590,836,000 pesos, an 18% increase, with a revenue of 2,419,724,000 pesos.

Communication.—Under normal conditions, Chile has extensive steamship connections with all parts of the world, including direct service under the Chilean flag to New York city, to Guayaquil, and to Argentina, Brazil and Uruguay by way of the Strait of Magellan. Air transport service to all parts of America is provided by Pan American airways and its affiliates, with several flights weekly. Air transport to Europe through Argentina and Brazil was maintained by an Italian line until Dec. 15, 1941, when it was stopped because of lack of gasoline. Rail lines from Arica and Antofagasta connect with Bolivia. The former will eventually form the Pacific end of a transcontinental railway to Santos (Brazil), on the Atlantic; the Antofagasta-Bolivia line is linked directly with the main centres of Chile. Rail-bus service to Argentina is maintained through the Transandine railway route (closed to through rail traffic in 1934) and by way of Bariloche in the south. A 179-mi. international line from Antofagasta to Salta (northwestern Argentina) was being constructed in 1941 at an estimated cost of 73,000,000 pesos.

Internal communication is by rail, coastwise shipping, air and highway. The state-owned railway system extends south to Puerto Montt, with a narrow-gauge line on the island of Chiloé, and in the north (in Tarapacá province) includes the Nitrate railway lines (acquired in 1941). Domestic aviation is well developed under the National Air lines, with routes from one end of the country to the other. The 23,000-mi. highway system includes nearly 10,000 mi. of improved road; although still far from adequate, it is being rapidly extended. The 1941 budget provided 97,000,000 pesos for highways and bridges. The Chilean merchant marine, owned, officered and manned by Chileans, is the best developed in Hispanic America. On June 3, 1941, a government decree prohibited sale or chartering of Chilean ships to foreign interests without government approval.

Foreign Trade.—Imports in 1940 totalled 507,100,000 gold pesos (1939: 410,800,000 pesos), exports 696,700,000 gold pesos (1939: 671,400,000 pesos). The United States supplied 47.9% of all imports (1939: 31.1%), Great Britain 10.4% (1939: 8.3%), Peru 8.4% (1939: 5.1%), Argentina 6.7% (1939: 4.4%), Japan 5.5% (1939: 3.7%), Italy 4% (1939: 3.9%), Germany 3.5% (1939: 22.7%), Brazil 2% (1939: 1.3%). The most important individual products imported in 1940 were petroleum, sugar, cotton cloth and yarn, industrial and office machinery, cattle, coal, benzene, automobiles, laminated iron and steel and wool cloth. Aside from nitrate and iodine purchases (not reported by country of destination, but aggregating 20.2% of all exports in 1940 and 22.5% in 1939), the United States took 58.3% (1939: 30.5%), Great Britain 5.8% (1939: 12.3%), Japan 4.5% (1939: 11.9%), Italy 3% (1939: 3.7%), Argentina 2.7% (1939: 1.9%), France 0.9% (1939: 4.7%). Approximately 45% of all nitrate and iodine exports (20% in 1939) went to the United States, bringing its share of the whole to roughly 68.3%. Mineral products made up 82.9% of all exports (1939: 80%), agricultural 6.3% (1939: 7.8%), animal 4.7% (1939: 6.2%), manufactures, chiefly meats and sugar, 3.2% (1939: 3.3%). Copper alone accounted for 54.6% of all exports (1939: 49.4%), precious metals 7.7% (1939: 6.9%), iron ores 2.1% (1939: 2%). Molybdenum, with no export in 1939, was valued at nearly $600,000 in 1940. The leading agricultural exports were beans, lentils and peas. Wool made up two-thirds of animal product exports, fresh and frozen meats and hides nearly a sixth each.

In the first half of 1941, imports of 228,500,000 pesos value (a 2.7% increase) came chiefly from the United States (54.1%), Great Britain (13.2%), Peru (7.2%), Argentina (6.6%) and Japan (5.1%). Exports, valued at $343,500,000 pesos (a 15.7% decrease), went to the United States (60.8%), Japan (7.5%), Great Britain (5.2%), Argentina (4.1%), aside from nitrate exports of 14.6%, whose destination was undisclosed. Copper made up 58.9% of all exports, other minerals (including nitrates) 23.1%; agricultural and pastoral products 14.4%. Wool comprised 6.3%.

Manufactures.—Manufacturing has, in the past, been confined almost entirely to goods for domestic consumption, especially heavier goods, but provides only a minor part of domestic needs. In 1940 the index of manufacturing stood at 167.2% of the 1927-29 average. Ten leading industries employed 22,093 persons at the end of 1940.

Mineral Production and Agriculture.—The mining industry produces the greater part of all export values, although the proportion varies greatly from year to year. Agriculture, however, is the actual economic backbone of the country. Copper production in 1940 was 352,010 tons (a 3.8% rise); nitrates, 1,428,379 tons (1.2% off); iron, 1,748,418 tons (7.6% advance); coal, 1,937,438 tons (4.7% rise); gold, 10,663 kg., and silver, 47,139 kg. increased 5.5% and 28.3%, respectively. Iodine, 1,294 tons, increased 194.1%. In 1940 an average of 63,181 men were employed in mining, against 61,837 in 1939 and 65,402 in 1938. One-third were employed in nitrates, 30% in copper, 25% in coal. Average employment in the first half of 1941 was 62,333. In that period 147,142 tons of copper, 859,611 of iron, 849,822 of coal and 20,476 kg. of silver were produced. Agricultural production (cereals, fruits, potatoes, vegetables and legumes) is of wide variety, and is mainly consumed within the country. (*See* also HISPANIC AMERICA AND WORLD WAR II.) (L. W. BE.; L. C. DEA.)

China, a republic of eastern Asia with a five-power system of government operating on the basis of Sun Yat-sen's political philosophy. Flag, a red background with a blue sky and a white sun in the upper left corner. Area: 4,480,992 sq.mi.; excluding Manchuria, Outer Mongolia and Tibet proper, 2,903,475 sq.mi.; invaded territories (July 1937–Dec. 1941) more than 500,000 sq.mi.; Free China, about 2,300,000 sq.mi., with a population of approximately 250,000,000. Total population, around 450,000,000. Capital: constitutional, Nanking; wartime, Chungking. Cities with inhabitants of over 100,000 total about 100; Shanghai (1939) 3,848,644; Peiping and Tientsin each more than 1,000,000; Nanking and Canton reduced to less than 1,000,000 as a result of the war; other cities with a population exceeding 500,000: Chungking, Chang-sha, Chengtu and Hankow; other important cities with more than 200,000 population: Kunming, Sian, Kweiyang, Tsingtao and Foochow. Religions and philosophies: Confucianism, Buddhism, Taoism, Lamaism, Christianity and Mohammedanism. President (titular head) Lin Sen; premier (president of the Executive Yuan) Gen. Chiang Kai-shek (*q.v.*).

History.—In the early spring of 1941, Chiang Kai-shek declared that the military crisis in the Sino-Japanese war had definitely passed. The international situation also turned in its favour as China began to receive aid from the United States under the lend-lease program. Following U.S., British and Dutch economic warfare against Japan in the summer, the collaboration between China and the democracies seemed to be closer, and there was some understanding, if not agreement, among the ABCD (American-British-Chinese-Dutch) powers in the Pacific. After Japan's blitz attack on the United States and the British empire Dec. 7, China declared war on Japan, Germany and Italy simultaneously. For China's part in the war, *see* CHINESE-JAPANESE WAR and WORLD WAR II.

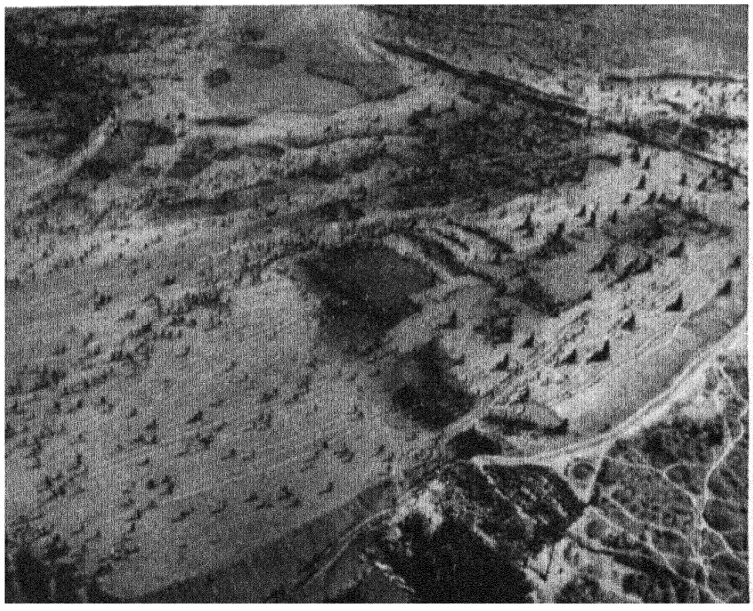
Internally, China's united front suffered a blow early in 1941 when Chungking ordered the new fourth army to be disbanded on the ground of military discipline. However, public opinion at home and abroad, the determination of both the Kuomintang and communists to resist Japan, and the German invasion of the U.S.S.R. checked further friction between the two major parties. Progress in democracy was seen in the strengthening of the People's Political council by increasing its members from 200 to 240,

by enlarging its power and by having 102 of its councillors elective. While the Kuomintang still maintained the constitutional monopoly of power, other minor parties shared more consultative and administrative power than before. Centralization was advanced in the fiscal policy of 1941, to abolish the fiscal prerogatives of the provinces and establish national and county fiscal divisions—thus giving a home-rule system to the county government. National control of economic and social life was also tightened in 1941 by government control of food prices and monopolies on salt, sugar, tobacco and wine and by placing all the social and labour organizations and the Chinese industrial co-operatives under the control and supervision of the ministry of social affairs. In spite of continuously rising prices in food and other commodities, progress was made in all phases of national life in Free China.

Education.—The government spared no effort in saving demolished and damaged universities and in promoting education on all levels, and the estimated national budget for reconstruction, education and cultural affairs increased from 10% to around 19% in 1940. In 1941 there were 113 universities and colleges in comparison with 108 in prewartime. Of these 113 higher educational institutions, 41 were national, 21 provincial and 51 private. The total enrolment was given by the ministry of education as 44,422 in 1940 as against 31,188 in 1937. In 1937 there were 3,264 middle schools in China, of which about one-third were in the occupied areas; at the end of 1940 the number of middle schools in Free China had increased from 1,896 in 1937 to 1,973, while the enrolment had risen from 389,948 to 489,414. Primary education made little progress and the number of primary schools in 21 provinces decreased from 229,911 with 12,847,924 students in 1937 to 212,740 with 12,180,542 students in 1939–40. The five-year program of 1940 aimed to convert the remaining 140,000,000 adult illiterates into intelligent citizens before 1945. In the occupied areas, particularly in north China, the educational system in 1941 showed considerable deterioration quantitatively and qualitatively.

Defense.—The conscription law subjecting all male citizens between 18 and 45 to military service was promulgated in 1933 and revised in 1935, but it was not enforced until after hostilities began in 1937. Because of exemptions and substitutions the system of military service still consisted largely of mercenaries in 1941. The highest figures given by the minister of war put China's army in 1941 at 6,000,000 men under arms, of which 4,000,000 were at the front, and 2,000,000 were in reserve. Communist troops controlling a small portion of Free China were estimated at 750,000. China's army is badly in need of heavy artillery and of tanks, which number only a few hundred. China's small air force is a separate organization under the commission of aeronautical affairs. There has been no Chinese navy since Japan gained control of China's coast. Government expenditures on military forces increased from about 40% of the total outlays before 1937 to about 60% in 1940, but the estimated military budget of 1941 was considerably lower.

Finance.—Japan's invasion impaired China's main sources of revenue. To increase revenue, direct taxes were enlarged and introduced in 1940, and in 1941 the land tax was collected in kind or in cash by the national government instead of by provincial authorities. The actual outlays of 1939 were more than the announced budget of NC$2,859,000,000 for the year. While there was no complete budget published for 1940–41, it is safe to estimate that 1940's expenditures had passed the 5,000,000,000-yuan mark, and, according to unofficial data, the 1941 budget reached 6,000,000,000 yuan. Finance Minister Kung stated in Feb. 1941 that revenues covered only 25% of the expenditure. The bulk of this deficit had to be covered by the issue of notes, bonds and loans. At the end of 1940 the official figures of the note issue by the four government banks was NC$5,800,000,000, but private estimates placed the amount at more than NC$8,000,000,000, and the note issue at the end of 1941 was estimated at more than NC$10,000,000,000. China's dollar (yuan) was worth only around five U.S. cents throughout 1941, and in August the stabilization board, backed by Anglo-American credits of $90,000,000, fixed the exchange rate at $5-11/32 (or NC$18.82 for $1 U.S.) and at £3-3/16. China's gold reserve at the end of 1940 was estimated by the U.S. department of commerce at $100,000,000 exclusive of Anglo-American loans. Eight domestic loans were issued up to 1941, amounting to NC$3,430,000,000, 100,000,000 customs gold units, £20,000,000 and $100,000,000, and the chief foreign loans and credits up to 1941 came from the U.S.S.R., the U.S. and Great Britain, amounting to about $350,000,000, $200,000,000 and £25,000,000 respectively. In 1937 China had 164 banks with 1,627 branches, with approximately NC$400,000,000 paid-up capital, NC$4,500,000,000 in deposits and NC$5,800,000,000 in total resources. From 1937 to 1941 only a few new banks were founded, but more than 60 branches and agencies were established in the interior. There were also about 30 foreign banks in 1941 in China, plus the three banks of the puppet regime.



THOUSANDS OF COOLIES, looking like colonies of ants from the air, laboured in 1941 to fill in airfields for Chinese fighting planes

Trade and Communication.—According to Chinese customs reports, China's foreign trade increased from the 1939 total of NC$2,373,377,000 to NC$4,020,436,000 in 1940; of the latter NC$2,044,365,000 were imports and NC$1,976,071,000 exports, leaving an unfavourable balance of NC$68,294,000. From Jan. to Aug. 1941 imports reached NC$1,721,000,000 and exports, NC$2,018,000,000. Taking Free China alone, the 1940 favourable balance of trade amounted to NC$79,975,000, imports being NC$57,209,000, as against NC$137,184,000 in exports. The principal export articles are silk, tea, wood-oil, bristles, hides, eggs and egg products, tungsten, antimony, tin and handicraft; the principal imports are manufactured goods, machinery, chemical products, war supplies and food. Among the countries and regions importing Chinese goods, the U.S. usually ranked first, followed by Hongkong, Japan, Britain and Germany. After 1938 Japan's exports to China, excluding exports through illegal channels, exceeded that of the U.S., Hongkong, India, England and Germany to China.

All China's railways are single-tracked, with limited carrying capacity, and practically all were owned by the government in 1941. Of the 16 lines of railway totalling more than 10,700 km. in prewartime, 12 were completely lost, and in 1939 the remaining four lines (Chekiang-Kiangsi, portions of Canton-Hankow and Lunghai, and Hunana-Kwangsi) carried some 5,000,000 passengers and more than 1,000,000 tons of freight. Seven new lines of about 2,000 km., including the Yunnan-Burma, were projected in Free China, but less than half were completed by 1941. In north China Japan built, for military purposes, five new lines totalling more than 500 km. By the end of 1939 the length of highways in China totalled 214,430 km., one-fifth of which were surfaced. Free China had 80,000 km. of mostly unsurfaced roads (109,500 km. in the whole country before the war, of which only about 25,000 km. were surfaced). Motor vehicles were as scarce as the paved roads. The airways of the China Aviation corporation maintained 14 lines with a total length of 11,820 km. in 1939. The passengers and freight carried by airways for the year were respectively 27,516 and 236,622 kg. Free China's tele-communications have developed rapidly. The prewar figures of approximately 80,000 km. of telegraph and 23,000 km. of telephone lines were nearly reached in 1941 by the figures for Free China alone. The estimated prewar radio stations and sets amounted to about 60 and 100,000 respectively, and these figures had not greatly changed in 1941.

Agriculture.—China's chief industry is agriculture, which supports more than 70% of its population and contributes no less than 80% to the national income. Three-fourths of the entire population is engaged in farming, but only about 20% of China's land is cultivated and only 29% cultivable. According to investigations of the ministry of economic affairs, out of the entire 7,673,000,000 mou (1 mou=0.6 ac.) of cultivated land, 4,064,000,000 are in the occupied area and 3,607,000,000 in Free China. Ninety percent of the land is for crops and about 1% for pasture. The winter crops are wheat, barley, field peas, broad beans, rape-seed and oats; and summer crops, rice, glutinous rice, kaoliang, millet, corn, soybeans, sweet potatoes, cotton, peanuts, sesamum and tobacco. According to the national agricultural research bureau, the production of both winter and summer crops in the 15 provinces in Free China increased from the 1,592,969,000 piculs (1 picul=133-1/3 lb.) of the prewar 7-year average to 1,723,255,000 in 1939. Because of drought the 1940 production dropped to 1,632,364,000 piculs. In the same 15 provinces the livestock production of 1940 showed a decrease in quantity but a great increase in value.

Manufacturing and Mineral Production.—The industrialization of Free China by government capital and efforts had made rapid progress in 1941. Before 1937 China, excluding Manchuria, had about 2,700 modern factories and nearly half of them, with an annual production valued at about NC$600,000,000, were located in Shanghai. In 1940 there were 1,354 factories in Free China with a total production valued at more than NC$4,000,000,000 at the end of 1940. Before 1937 there were no modern plants for spinning and weaving in the interior, but during the next few years 200,000 spindles were moved into the interior. Excluding Manchuria, the annual prewar production of iron ore and coal in China was below 2,000,000 and 15,000,000 tons respectively. Since 60% of the coal and 85% of the iron reserves are located in the occupied areas, the speed of industrialization in Free China is limited. However, the prospect was encouraging in 1941, as the output of coal increased from 3,600,000 tons in 1937 to 5,700,000 tons in 1940; iron from 31,000 to 100,000 tons; tungsten from about 7,000 to 9,000 tons; antimony from 12,000 to 20,000 tons; tin from 1,000 to 17,000 tons; copper from 400 to 1,000 tons; and petroleum from 34,000 to 440,000 gal. The 1940 total production value of the modern factories, excluding small shops, was given by the ministry of economic affairs as NC$4,693,700,000: textiles took first place (NC$1,763,000,000), chemicals second (NC$1,438,000,000), gold third (NC$280,000,000), followed by electrical appliances and minerals. Because of political difficulties the Chinese industrial co-operatives, which had played an important role in the wartime economy, suffered a setback in 1941 and the monthly production was reduced to below NC$10,000,000. War, disease and the new industry have absorbed most of China's unemployed.

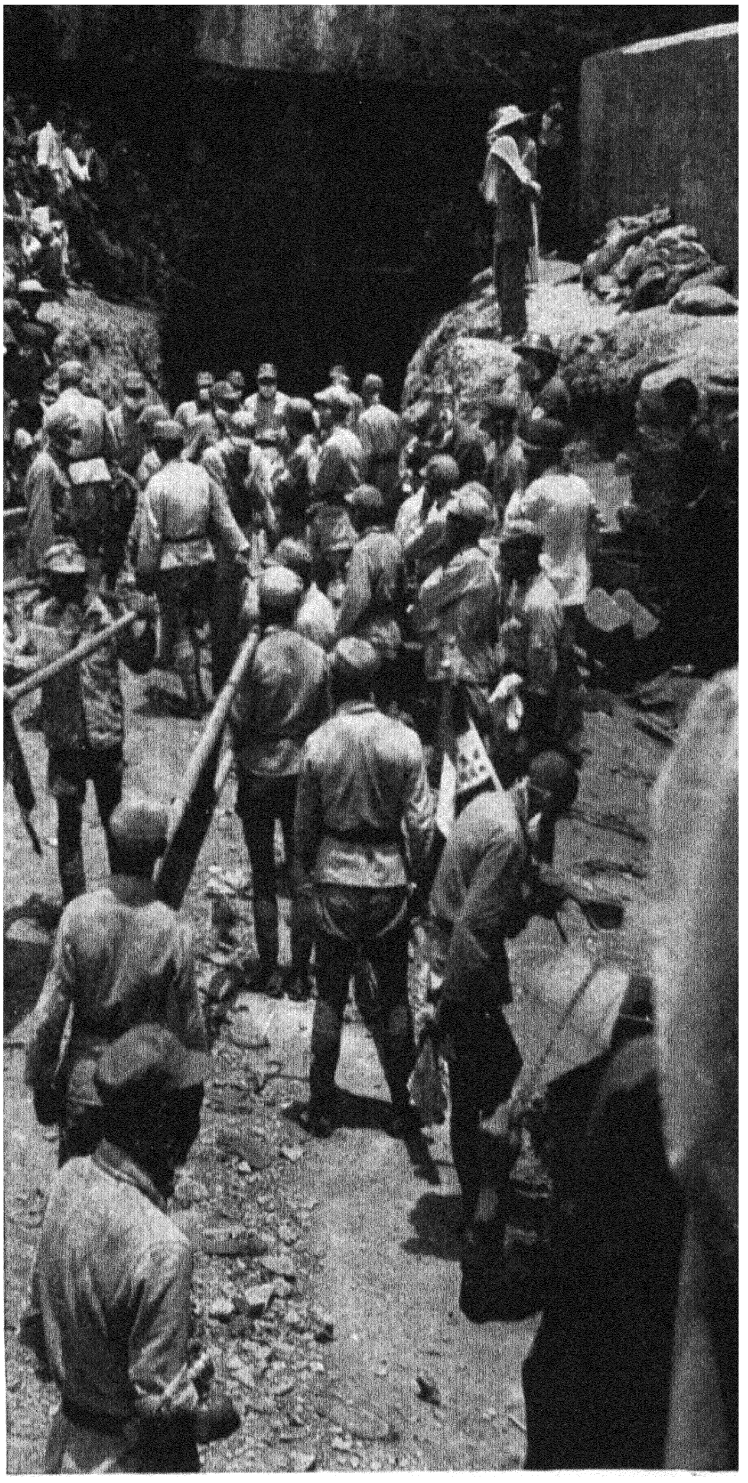
Chinese-Japanese War. In spite of the loss of territories, economic and financial destruction and difficulties, devastating air raids and the drain on human resources China continued its resistance in the fifth year of war, with the hope of a just settlement or an ultimate victory through the influence and assistance of the democracies. The year 1941 brought little change in the stalemate that had persisted since the fall of Hankow in Nov. 1938.

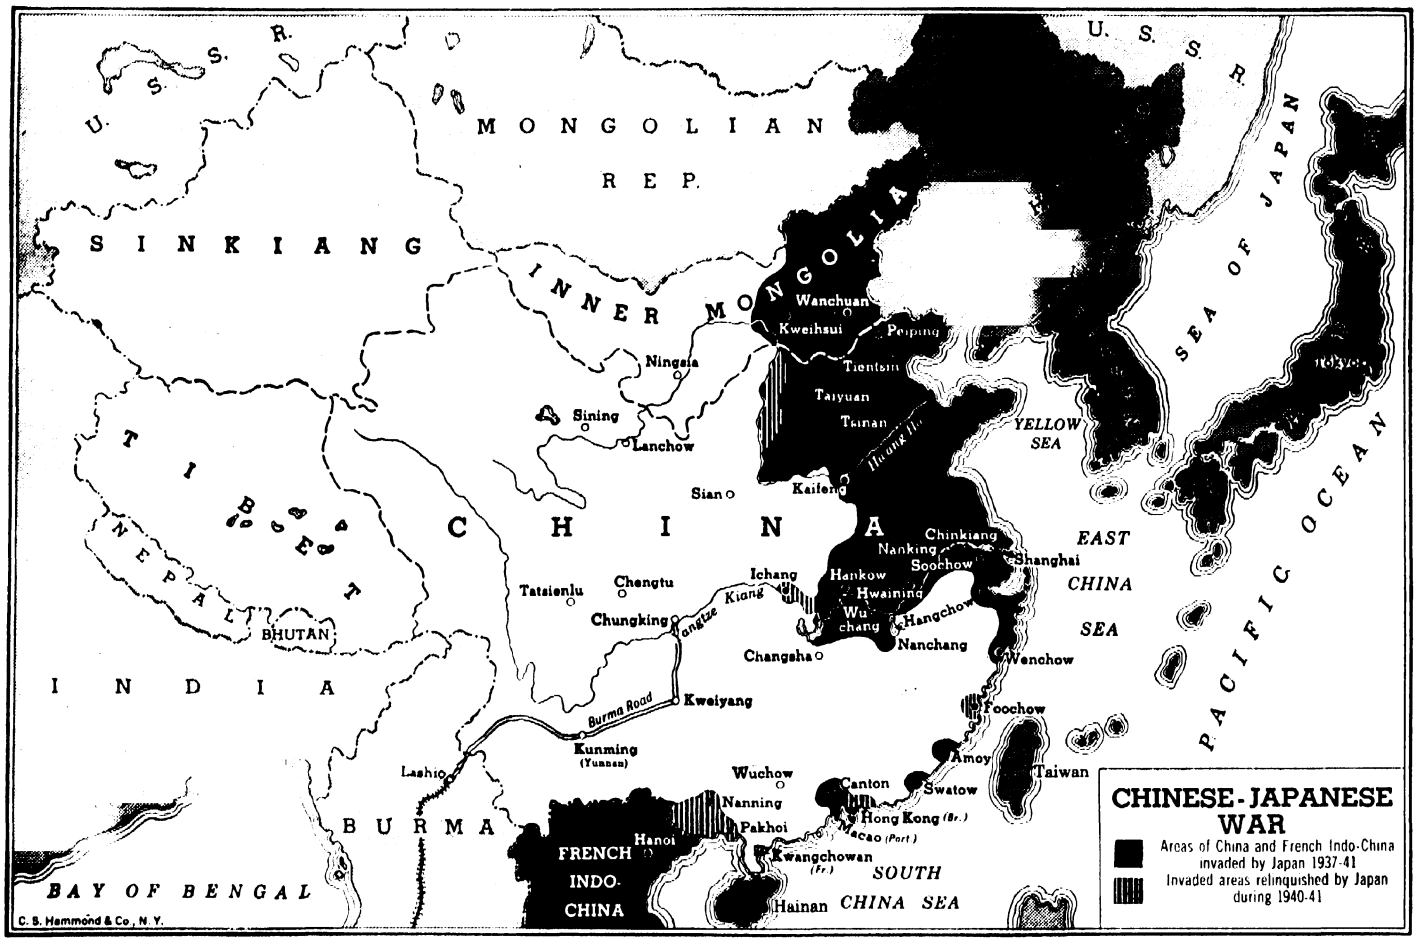
Fighting continued throughout 1941 and Chinese-Japanese objectives, tactics and positions remained unchanged. China's three-stage strategical theory of resistance (defensive in face of offensive, guerrilla warfare and stalemate, and counteroffensive) was matched by Japanese strategy of three periods: the great offensive, military consolidation and pacification. For both China and Japan the military operations of 1941 entered a twilight zone between the second and third stage of warfare; Japan continued to try to destroy or blockade bases of the Chinese government in the west, to stabilize a frontier of conquest, to annihilate China's armies and to exterminate opposition to Japan's political and cultural subjugation, while the Chinese initiated counteroffensive attacks along with widespread guerrilla warfare against the Japanese to prevent them from consolidating. For the sake of convenience the main theatres of war can be divided into three fronts; the northern front, including the five northern provinces; the central front, covering part of Hupeh, Hunan, Kiangsi, Chekiang and Kiang-su; and the southern and coastal front, running through Fukien, Kwangtung and Kwangsi to the Yunnan-Indo-China border. Japanese objectives were to cross the bend of the Yellow river in order to cut China off from communication with Russia, to break through the gorges along Ichang, the gateway to Chungking, and to attack the Burma road from Indo-China. Since its attempt to cross the Yellow river to Cheng-chow from the north had failed, Japan, taking advantage of the clash between the New Fourth army and the central troops, started, in the latter part of Jan. 1941, its "spring offensive" in southern Honan with the strategical 150-mi. section of the Pin-Han railway between Sin-yang and Cheng-chow as an objective. With Sin-yang as a base, Japan, marshalling some 100,000 men, started to push all the way up to Cheng-chow with a secondary southward drive from Kai-feng. Following their pattern of tactics of break-through, encirclement and large flanking movements in order to trap and destroy the Chinese forces, the Japanese made rapid progress in the beginning. As the Japanese forces were scattered and supply lines extended, the Chinese hit back, cutting enemy communications at the same time. In early February the Chinese recovered the lost ground and the Japanese plan was not accomplished in this surprise attack. Having failed in the Honan drive, Japan shifted the offensive to Suiyuan, Hupeh, Shansi, Kiangsi, Chekiang and Kwangtung, and sporadic and minor engagements continued in those regions in February and March. In the Shansi district, Japan undertook an offensive southward in February, attempting to establish a junction between its troops in south Shansi and north Honan but made no headway. In the Ichang sector heavy fighting began early in March, and simultaneously Japanese troops attempted to deal a blow to the Chinese forces concentrated in the vicinity of Shangkao, southwest of Nanchang, so as to remove the threat to Nanchang. The Chinese routed the Japanese there and, according to War Minister Ho, the Kiangsi campaign was a disastrous defeat for Japan.



HUNDREDS OF CITIZENS of Chungking suffocated to death June 5, 1941 when panic broke out in the city's largest air-raid shelter during a Japanese bombing attack. Some observers placed the casualties as high as 4,000

In April Japan attacked southeastern Chekiang and the coast of Fukien in order to cut the remaining munitions routes of China's armies. Around April 20 Japan occupied Ningpo, Hainan, Taichow and Wenchow. On land it drove from Hangchow southward through Shao-hsing to Chu-ki but in May China recovered Chu-ki, Tai-chow and Wenchow.

In February Japan concentrated heavy air, naval and land forces in Canton, Formosa, Hainan and Indo-China. To screen this troop concentration and to cut off the communication routes of China with foreign markets, Japanese troops landed on Feb. 4 on Bias bay. On March 3 Japanese troops under the cover of air and naval fire occupied six different points stretched over a distance of 250 mi. along the Kwangtung coast, and at the same time Japanese warships steamed down to Indo-China to back up the ultimatum to France for acceptance of Japan's Thai-Indo-China peace terms. On March 9, after heavy looting, Japan withdrew from the entire area of the southern Kwangtung coast and the



announcement of withdrawal coincided with the settlement of the Thai-Indo-China dispute in Tokyo. Toward the end of March Japan staged another landing at Kitchioh bay, presumably to cut the remaining coastal routes into free China. In April Japan withdrew from the southeastern part of Kwangtung in face of Chinese reinforcements and attacks. Japan launched the "May offensive" with operations in four areas: Hupeh, Kwangtung, northern Honan and southern Shansi. The objective was to drive the Chinese troops out of north China and close the 150-mi. gap of the Pin-Han railway. Japan used eight divisions, two of which were transferred from south Manchuria. The Chinese forces holding out in Chungtiao mountains were split by the Japanese columns which pushed down from the north. Japan concluded the campaign with some success but the co-ordinated attacks of the Chinese communist forces and central troops checked further Japanese advance. The comparative lull in summer was generally attributed to Japan's indecision as to which way to turn after the outbreak of the German-soviet war. Meanwhile Japan's air force attacked important interior cities and continuously raided Chungking.

On Aug. 25 China started a general offensive on all fronts in central and north China and the Chinese air force reappeared after an absence of many months. The Chinese offensive was regarded as preliminary to a general counteroffensive and was aimed at preventing the withdrawal of Japanese forces for a southward or northward move. The Chinese military authorities claimed that the counterattack was "initiated as a result of an unwritten British-Chinese alliance." It was intended to demonstrate to the United States that China was able to attack and that any U.S. appeasement to Japan would be unwelcome. On Sept. 3 the Chinese recaptured Foochow and forced the Japanese to withdraw from Ningpo and Swatow sections. Partly to convince the United States of Japan's ability to settle the "China incident" so as to prevent further U.S. aid to China, Japan launched in north and central China the "fall offensive," designed as a gigantic pincer against Chungking. Japan's northward drive from Canton, co-ordinated with the Chang-sha campaign to capture the remainder of the Canton-Hankow railway, failed but the battles of Chang-sha, Ichang and Cheng-chow proved to be the fiercest and most important engagements of the year. Japan sent over 100,000 troops into the Chang-sha campaign and on Sept. 18 they began to pour down from their Yo-chow base. To avoid fighting in unfavourable terrain the Chinese offered no real resistance but lured the enemy to the battleground of their choice. The Chinese struck back with vigour on Sept. 29–30 when a small detachment of Japanese entered the northeastern corner of Chang-sha. Realizing they were trapped once more, the Japanese began, on Oct. 1, their retreat which proved to be a "debacle many times worse than 1939" according to the Chinese. Having failed to hold Chang-sha, the Japanese concentrated their drive in Honan, moving southward across the Yellow river with Cheng-chow as their objective. Originally it was intended to coincide with the drive on Chang-sha in a move to close in on Chungking. On Oct. 4 Japanese forces entered Cheng-chow. But after the southern campaign toward Chang-sha collapsed, the Cheng-chow drive lost its strategic significance. On Nov. 1 China recaptured Cheng-chow. Co-ordinate with the counteroffensive on Chang-sha and Cheng-chow, China attacked Ichang and Shasi on Oct. 6. After a fierce four-day hand-to-hand combat the Chinese recaptured Ichang. When the Japanese used gas to attack Ichang, according to Chungking, the Chinese forces withdrew on Oct. 13. The Chinese and Japanese military situation reverted to its original status and Japan's "fall offensive" ended in another major defeat. Toward the end of 1941 Japan continued to concentrate troops north of the Yellow river, attempting a direct drive on Chungking, while forces concentrated in Canton and Indo-China aimed at Yunnan and the Burma road. Until it was safely established in Indo-China and Thailand, Japan

had little chance to attack Yunnan successfully. On Dec. 7 Japan moved into Thailand and attacked Hongkong and other Pacific areas. China switched from defensive to offensive and gathered a large force under the personal command of Chiang Kai-shek to attack the Japanese in the rear in order to relieve the British in Hongkong. China continued to fight as an ally of the western democracies and urged the Allies to form a united command in the war of the Pacific. (*See* WORLD WAR II.)

Political Developments.—Japan's decision to join the axis and to set up Wang's regime as a means to settle the "China incident" barred any possibility of direct negotiation between China and Japan as Chungking declared, toward the end of 1940, that China would make no peace with Japan until the war in Europe came to an end. To resist Japanese aggression to the bitter end has been the public demand and national policy of China to which both the Kuomintang and Communists have subscribed. Neither one would venture to alienate the support and confidence of the large part of the people that belongs to either by starting a civil war. Thus the New Fourth army incident in Jan. 1941 resulted in no open conflict as both Chiang Kai-shek and Chou En-lain, the communist liaison official in Chungking, appealed to unity and pledged to avoid further friction. The soviet international position and Lachlin Currie's and Owen Lattimore's missions to Chiang helped to improve and strengthen China's united front.

To liquidate the "China incident" had been the task of the Japanese government and the inability to settle it had caused the cabinet to change seven times since the beginning of the war. The instability of the government reflected also the long struggle behind the scenes between rival views and forces. To attempt to wield a unitary control over all the factions Konoye created the Imperial Rule Assistance association which faltered in 1941. The anomalous situation arising from the soviet-German war shook the second Konoye cabinet. On July 18 Konoye reorganized the cabinet by dropping Matsuoka and by enlisting half of the cabinet members from the fighting services. The reorganization of the cabinet was followed by Japan's occupation of southern Indo-China. To ease the tension, the third Konoye government solicited an understanding with Washington. As Japanese-American relations showed no sign of improvement, the third Konoye government fell and Gen. Hideki Tojo, with the support of the navy, took over the premiership on Oct. 18; thus the Japanese army emerged from behind the curtain to settle the "China incident." Early in 1941 Japan repeatedly offered peace overtures to Chungking, seeking vainly an amalgamation of Chiang's government with Wang's regime. After Wang's visit to Tokyo in June, Japan made another attempt to strengthen Wang's position militarily, economically and politically by allowing Nanking's armed forces to increase to 500,000 men, by advancing a loan of 300,000,000 yen and by seeking collaboration between Wang and Japan's axis partners in order to enable Wang to carry out his assigned duties: termination of the hostilities, pacification and elimination of foreign interests in the occupied areas. Since Wang's regime failed to attract any influential leaders from Chungking it exerted no influence over the Chinese.

Economic Warfare.—Japan's economic offensive goes hand in hand with the political and military. To control completely China's economic resources and activities and to restrict or suppress non-Japanese foreign business interests in the occupied areas, the Japanese government and big business joined hands: the former controlled the mines, the iron industries, the communications and public utilities and the latter, manufacturing and trade. Everything of industrial importance which could be seized was in Japanese hands; all public utilities were run by them and no important Chinese enterprises remained independent. In 1941 Japan obtained practically all the iron and coal and a great deal of the cotton of the occupied areas in addition to NC$100,000,000 to NC$150,000,000 a month in cash. But the supplies and cash squeezed out of China failed to bring Japan economic relief on a large scale. In order to undermine Chinese national currency and to exterminate the influence of the National government in occupied China the Central Reserve bank was established in Jan. 1941. Like the other two puppet banks it tried to absorb Chinese national currency for the purchase of foreign exchange, to eliminate the circulation of the national currency by enforcing the use of the new notes as legal tender, and to force merchants to buy and sell foreign exchange through the new bank. In spite of the competition of the puppet bank notes, the Japanese yen and unsecured military notes, the national currency in Shanghai and occupied areas remained firm. The America-Britain-China Stabilization board strengthened the value of the national currency by regulating the buying and selling of foreign exchange at a fixed rate. China's dollar became virtually blocked currency. The Allies' blockade of Japan by the freezing of Japanese assets and severing of trade relations thereafter cut off about 75% of its normal imports, resulted in steel and iron shortage, affected Japanese supplies of oil and gasoline and crippled the silk and cotton industry. Chosen (KOREA). A part of the Japanese empire since 1910, Chosen is a peninsula extending southward from the northeastern side of the continent of Asia. It is bounded E. by the Sea of Japan, W. by the Yellow sea and N. by Manchoukuo and the maritime province of Siberia. Area, 85,206 sq.mi., including 1,018 islands; pop. (Dec. 31, 1938) 22,633,751, including 633,320 Japanese and 49,815 other foreigners, mostly Chinese. The capital is Seoul (Keijo), population (1937), 706,396. Other cities: Fusan (213,142); Phyöng-yang (Heijo) (185,419); Taikyû (110,866). Governor general, Gen. Jiro Minami (took office 1936). The country is administered by the government-general, which has seven main administrative offices and two departments: namely, (1) governor general's secretariat and home affairs bureau, (2) financial affairs bureau, (3) industrial bureau, (4) agricultural and forestry bureau, (5) judicial bureau, (6) educational bureau, (7) police bureau, together with the departments of foreign affairs and planning. The governor general convenes an advisory council, consisting of a chairman, a vice-chairman, five advisers and 65 councillors, several times a year.

Education and Religion.—Chosen in 1938 had 5,975 schools, with 1,981,587 students. There was only one university, with 516 students; but there were 9,086 Chosenese students in Japan in 1938. There have been a number of mission schools in Chosen, but their work must have ceased entirely after the outbreak of war between Japan and the United States in Dec. 1941. Some mission schools had already been closed because of disputes with the authorities over the requirement that obeisance be rendered by the students at Shinto shrines. Buddhism, Confucianism and Taoism, all somewhat coloured by the Chosenese national background, are prevalent forms of religion. There were 494,500 Chosenese and 5,800 Japanese Christians in Chosen in 1938.

Finance and Banking.—The unit of currency is the Japanese yen (fixed for several years at the nominal value of 23.48 cents U.S.). The Bank of Chosen issues currency and fulfils other functions of a central banking institution. In 1938 there were nine banks in Chosen, together with branch establishments of three Japanese banks. The amount of currency in circulation was 443,980,609 yen at the end of 1939, and 580,533,508 yen at the end of 1940. Bank deposits were 624,316,000 yen in 1938. The budget for 1940–41 was 837,786,717 yen.

Trade and Communication.—Chosen's exports in 1939 were 1,006,794,000 yen; imports were 1,388,448,000 yen. Exports to Japan were 736,883,000 yen; imports from Japan, 1,229,417,000 yen. There were 4,214.6 km. of government-owned railways in Chosen in 1939, and 1,211.8 km. of privately-owned railways. The length of the network of roads in Chosen at the end of 1938 was 27,731 km. On the same date, there were 1,773 steamers with a tonnage of 110,079, and 14,125 sailing boats with a tonnage of 186,850. There were three airports in 1941 at Seoul, Phyöngyang and Urusan, and a meteorological station at Urusan. The length of telegraph and telephone lines in 1941 was 8,863 km. and 11,115 km.

Agriculture, Manufactures, Minerals.—Chosen is predominantly an agricultural country, with rice as the principal crop. As a result of extended acreage and improved methods of cultivation, the output of rice, on the average, doubled after the annexation of the country to Japan in 1910. A record crop of 120,000,000 bu. was harvested in 1938, but this declined to 70,000,000 bu. as a result of drought in 1939. There were 700,000 head of cattle in Chosen in 1910 and 1,717,062 in 1938. Other agricultural products were barley, wheat, millet, apples, cotton and silk. Precise figures of industrial and mineral production for later years were unavailable in 1941, because the Japanese government ceased to publish such figures for reasons of military strategy. Gold is the most valuable mineral; production of this metal increased fairly rapidly during the '30s, and had reached the figure of 49,909,000 yen in 1936, the last year figures were published. Chosen also contains some iron and coal. The chemical industry took first place among manufactures, with foodstuffs second.

(W. H. CH.)

Christian X (1870–), king of Denmark, K.G., of whom a biographical account will be found in the *Encyclopædia Britannica,* nephew of Queen Alexandra of Great Britain, succeeded his father, Frederick VIII, in 1912. Beloved by his people, and well known for his democratic ways, he continued through 1941 to symbolize the continuity of Danish political institutions, though the German grip on the administration was intensified during the second year of the occupation. Again the king's birthday, his 71st, on Sept. 26 brought evidences of popular loyalty and unity. He continued to live in Amalienborg palace in Copenhagen, though at the very end of the year reports circulated that he was threatening abdication as a protest against new German demands. (*See* also DENMARK.) (F. D. S.)

Christian Science. At the end of 1941, Christian Science wartime activities included eight chaplaincies in the United States Army and seventy-five Camp Welfare Workers. These workers co-operated with chaplains and morale officers, rendering a service like theirs, and maintained

Camp Welfare Rooms at points convenient to camps and military stations at which officers and enlisted men might read, rest, and write letters.

During the year from Oct. 1, 1940, the Christian Science Mother Church (The First Church of Christ, Scientist, in Boston, Mass.) and its branch churches and societies in the United States carried on a remarkable war relief work. During this time, the war relief committees formed by these churches shipped over 700,000 lb. of clothing, worth over $700,000, to Great Britain, where other Christian Science committees distributed the clothing for the benefit of sufferers from the war without regard to their religious faiths. These shipments filled 4,482 crates of standard size. After Oct. 1, 1941, 1,000 more crates of clothing had been shipped to Great Britain by the same committees to be handled in Great Britain in the same way. Of all these shipments, only 25 crates were lost, a loss which amounts to less than one-half of 1% of the total shipments.

In Germany, in Aug. 1941, the Hitler government issued a decree banning Christian Science from German territory and confiscating its property. Presumably this decree registered the complete opposition of National Socialism to religion in general and to Christian Science in particular.

Christian Science is a Christian teaching and practice based directly upon the words and works of Christ Jesus, as distinguished from later creeds and customs. The aim and purpose of the Church of Christ, Scientist, is to "reinstate primitive Christianity and its lost element of healing" (*Church Manual*, p. 17). Christian Science is best known for its healing. Yet, its simple and forthright theology earns and receives increasing comprehension and respect.

At the end of 1941, there were 11,000 practitioners, having cards in *The Christian Science Journal*, who are engaged exclusively in Christian Science healing work. There are also many other practitioners devoting such time as each of them can to the practice of Christian Science, although otherwise employed. (C. P. S.)

Christian Unity. It was characteristic of unity movements in 1941 that, though occurring in widely separated parts of the world, they turned out to be of broad general concern. The notable plan for union in South India of churches of Anglican, Methodist, Presbyterian and Congregational origins under a constitutional episcopate was encouraged by denominations with which these India churches were affiliated in the United States and Great Britain, and was in 1941 apparently very close to accomplishment. The Foreign Missions Conference of the United States declared in June 1941 that the adoption of the South India plan would have far-reaching effects in encouraging similar movements in other lands. In response to an appeal from the "younger churches" of the foreign missions fields, this conference further advised all its member boards to facilitate unions of churches on the respective mission fields and at the same time ask the boards to give practical co-operation to the ideal of unity in their own practices and policies, "so that in the main a unified agency in the west may deal directly with the united churches and with the united administrative organizations in other lands."

In England a proposal for the organization of the United Free church, sponsored by ministers of five leading Protestant denominations, was presented to the Free Church Federal council and referred for further consideration to the constituent churches. Difficulties confronting this far-reaching suggestion were frankly recognized. The same session of the Free Church Federal council considered a report summarizing the replies of the constituent churches to a proposal drafted by a joint commission for reunion of the Free churches with the Church of England. The chief objections voiced related to the sacraments and the ministry.

A North American Ecumenical conference, including limited representation from Central and South America, was held in Toronto, Canada, June 3 to 5, and considered major practical problems confronting the churches of the world. In Dec. 1941, eight of the major national agencies of inter-church co-operation in the United States, including the Federal Council of the Churches of Christ in America together with the corresponding agencies of religious education, home and foreign missions and women's organizations, held a conference of 170 official representatives, which adopted in principle a proposal to combine all these agencies in an inclusive organization and remitted the details of the plan for further study. A merger of the three major organizations of Protestant women into the National Council of Church Women was subsequently effected. Negotiations between the Protestant Episcopal Church and Presbyterian Church in the United States of America developed an "interim" proposal for joint ordination of ministers, which if adopted would give ministers so ordained full recognition by both churches and make them available for pastorates of joint parishes composed of members of both churches and under the jurisdiction of both. The provisional machinery of the World Council of Churches continued to function in spite of increasing difficulty in communication. Six churches became members during the year. One in an occupied country joined secretly. The total membership stood at the close of 1941 at 76 churches in 26 countries. Of 168 "orphan" missions throughout the world cut off by war from their regular sources of support, 117 were aided under a world-wide plan of assistance fostered by the International Missionary council. Similar relief was extended to churches in European countries at war, to refugees and to war prisoners. (*See* also RELIGION.)

(H. P. D.)

Christie, Loring C. (?–1941), Canadian minister to the United States, was born in Amherst, N.S. From 1913 to 1923 he was legal adviser to the department of external affairs in Canada and served as technical adviser to Canadian delegations at many international conferences. An authority on international law and a vigorous advocate of Canadian-United States rapprochement, he took part in the transfer to the U.S. of British bases in the western hemisphere in 1940. He was also active in the negotiations ending in the St. Lawrence waterway agreement. In Sept. 1939 he was appointed minister to the U.S., a post he held until his death in New York city, April 8.

Chromite. Although complete data are lacking, world production of chromite in 1940 was estimated at 1,250,000 metric tons as compared with 1,150,000 tons in 1939. Most of the countries from which 1940 data were received show an improvement in output.

World Production of Chromite

(Metric tons)

	1929	1937	1938	1939	1940
Cuba	53,709	94,592	40,200	67,100	52,900
Greece	24,214	52,000	42,500	55,000?	?
India	50,361	63,300	44,800	?	?
Japan	9,163	?	?	?	?
New Caledonia	52,594	48,022	52,200	52,000	55,800
Philippines	—	69,856	66,900	126,700	194,400
South Africa	63,974	168,600	176,600	150,000	163,600
So. Rhodesia	265,909	275,617	186,000	139,100	300,000?
Turkey	16,178	192,508	213,600	191,600	110,000
U. S. S. R.	52,889	?	?	?	?
Yugoslavia	43,022	59,932	58,500	59,500	?
Total	635,200	1,300,000?	1,050,000?	1,150,000?	1,250,000

Although a material proportion of the war demand of 1917–18 was supplied from domestic mines, there had not been any appreciable effect on United States production after the outbreak of World War II. Increased demand was met by greater imports than ever before; these totalled 657,700 long tons in 1940, as against a previous maximum of 553,900 tons in 1937. In the first eight months of 1941 imports were 548,738 tons, a rate equivalent to 820,000 tons a year. The August total was the largest of the year except for June, and this might make it appear that shipments were being maintained, or even increased, but since the data are imports for consumption, and include not only actual receipts for the month, but also any withdrawals from bonded warehouses, there is no way of knowing whether current receipts were adequate to meet current consumption, or whether a deficit was being made up from stocks previously accumulated. It had been reported, however, that chromite was holding its own about as well as any imported commodity. It is to be noted, however, that with the United States at war with Japan, and with the Philippines an active zone of combat, shipments from that area would probably be stopped, and it was possible that imports from New Caledonia might be interfered with now that the war zone reached that area of the Pacific. (G. A. Ro.)

Chronology: *see* CALENDAR OF EVENTS, 1941, PAGES 1–16.

Churchill, Winston Leonard Spencer

(1874–), British statesman, was born at Blenheim palace, Oxfordshire, England, on Nov. 30, the elder son of Lord Randolph Churchill and Jennie, daughter of Leonard Jerome of New York city. For his biography and his political career during World War I, see *Encyclopædia Britannica.*

The outbreak of war on Sept. 3, 1939, was the occasion for Churchill's re-entry into the cabinet in his old office of first lord of the admiralty. On May 7, 1940, Chamberlain, partly in answer to criticisms of the Norwegian campaign, made him supervisor of day-by-day military operations. Three days later, as the big German drive began and Chamberlain resigned, Churchill became prime minister. The military disasters which followed in rapid succession served to emphasize his qualities of leadership, which had a strong effect in bolstering British morale at one of the gravest moments in the empire's history. On June 4, 1940, after the evacuation of Dunkirk, he promised that Britain would fight on alone, "whatever the cost may be." Churchill's public addresses and reports to parliament as the war progressed were in the main simple and frank statements that did not attempt to disguise the gravity of Britain's danger but invariably pointed up the nation's will to resist.

Throughout the varying fortunes of British arms in 1941, Churchill's personal popularity remained high. Criticism in parliament and in the press was levelled at members of his cabinet rather than at him. On May 7, shortly after the severe defeats in Greece and Libya, he received a 447-to-3 vote of confidence in the house of commons. His conduct of relations with the U.S. was both diplomatic and straightforward, and he did not hesitate to say in his address before the joint session of congress in Washington on Dec. 26 that "if the United States has been found at a disadvantage at various points in the Pacific ocean, we know well that that is to no small extent because of the aid which you have been giving to us in munitions for the defense of the British Isles, and for the Libyan campaign, and above all, because of your help in the battle of the Atlantic." Nor did he hesitate to insert the "due respect for their existing obligations" clause in the Atlantic charter in August. Equally straightforward were his statements regarding the U.S.S.R. and Japan. When Germany invaded the U.S.S.R. June 22, Churchill promised help to the Russians: "Any man or state who fights against naziism will have our aid." Yet at the same time he refused to modify his frequently expressed opposition to communism in its political sphere. Toward Japanese plans for a "new order" in eastern Asia he was adamant. He warned Tokyo on Aug. 24 and again on Nov. 10 that Great Britain would declare war immediately in the event of a Japanese attack on the U.S. This promise he fulfilled Dec. 8. (*See* also GREAT BRITAIN.)

ROOSEVELT AND CHURCHILL after church services aboard the British battleship "Prince of Wales" Aug. 10, 1941, during their historic rendezvous in the Atlantic

Church Membership.

The following figures, taken from the 1941 edition of the *Yearbook of American Churches*, published under the auspices of the Federal Council of Churches of Christ in America, show that about one-half of the population of the United States (slightly over 49%) were reported as church members. Of these, 97.4% were within the 52 religious bodies each having more than 50,000 members; the remaining 2.6% were in 198 smaller bodies.

The "inclusive membership" column in this report gives the official records of the church bodies listed, based on their own reports. The "13 years or over" column is given for use in comparisons and discussions of the relative numerical standing of

the churches reported.

Between 1930 and 1940 the population of the continental United States increased 7·2%; the officially reported church membership increased 7·86%. The 1936 Census of Religious Bodies is incomplete and unsatisfactory for some denominations, on account of the refusal of many ministers in these denominations to co-operate. The main differences are in the figures for the Southern Baptist Convention, the Methodist Episcopal and the Methodist Episcopal South, which reported only 43,618 churches to the 1936 census, while their own official statistics for the same year report 65,267 churches. An analysis of the causes of this non-co-operation is found in the 1941 *Yearbook of American Churches* pp. 139–41. (*See* also CHRISTIAN UNITY.)

Church Membership in the United States in 1940*

Body	*Churches*	*Inclusive Membership*	*13 Years or Over*
African M. E.	7,115	650,000	581,750

*Continental United States only.

(L. A. We.)

Church of England. In the history of the Church of England, as in secular history, the year 1941 will be marked by sinister memories. But the record is not all one of loss. Against the bombing of Lambeth palace, of several cathedrals and of more than 1,000 churches, church halls and schools, with the death or mutilation of many clergy and lay folk doing voluntary fire-watching, must be set several portents of hope. There were countless cases of individual heroism and a national mood of ready self-sacrifice. There was a growing realization of the importance of religious education and a movement, in which all the Christian churches co-operated, to secure it in all schools. Last but not least, there were renewed signs of a growing national revival of religion.

Of the damage disclosed during the year (some of which occurred before the close of 1940) special mention must be made of the heavy bombing of the new Church House, Westminster, just completed as a centre for the whole of the world-wide Anglican communion; and of some important missionary and diocesan offices. The great new cathedral at Liverpool had a narrow escape when a bomb passed through the outer roof of a transept, but was happily deflected before the full force of the explosion could take effect.

Of many practical steps taken, the more important included the launching in February of the War Damage Central Relief fund; and the passing by the Church assembly of a measure setting up in every diocese a reorganization committee with far-reaching powers to carry out postwar reconstruction and rationalization, including the closing of redundant churches and the use of war damage compensation to rebuild to the best advantage in view of the movements of population and industry. The Central Council for the Care of Churches made provision for the emergency storage of valuables and pressed forward a national photographic survey of all churches, so that there might be available complete photographic records of churches making possible accurate restoration after bombing.

Effective work was done by two special committees in supplementing that of the chaplains in promoting religious education among men and women in His Majesty's forces. The church suffered a great loss by the death of Dr. F. Partridge, bishop of Portsmouth, the great financial genius and organizer behind most of the major financial developments since 1918. Episcopal resignations were Dr. H. E. Bilbrough, bishop of Newcastle, Dr. C. Lisle Carr, bishop of Hereford, Dr. H. Mosley, bishop of Southwell, and Dr. A. W. T. Perowne, bishop of Worcester; Bishop Noel Hudson, general secretary of the S.P.G., Dr. R. G. Parsons, bishop of Southwark, Canon F. R. Barry and Prebendary W. W. Cash, general secretary of the C.M.S., were respectively appointed to these sees.

Turning to the wider field of the Anglican communion as a whole, deep gratitude was expressed to the American Episcopal Church for a generous gift of $300,000 to help the foreign missions of the Church of England; there were momentous changes in the Nippon Seikokwai (Japan Holy Catholic church), where all foreign bishops resigned and a purely Japanese episcopate took over. In September was celebrated the centenary of the bishopric in Jerusalem. The see of Gibraltar, which stretches from the Atlantic to the Persian frontier, endured heavy trials and difficulties.

Civilian Conservation Corps. The training of young men in good work habits and in national defense skills plus the advancement of a nation-wide conservation program represented the outstanding activities of the Civilian Conservation Corps during the 1941 calendar year.

Although the number of applicants for enrolment in the corps continued to be large, the high rate of turnover in the camps brought the average enrollee strength for the year well below any previous 12-month period since the corps was established in 1933. The high rate of turnover was due to the large demand on the part of industry for trained workers together with the fact that young men could obtain jobs with less training than had been the case for many years. Corps records showed that 322,000 men were enrolled in the CCC during the 1941 fiscal year and that a total of 550,000 men were in the corps at one time or another during the year.

The young men enrolled in the CCC camps received training while at work on the various types of conservation projects carried on during the year. They also had an opportunity to supplement the training on the job by attending classes or working in shops in the evening. About 40,000 men attended special national defense training courses financed by funds

voted for national defense training.

A new type of activity—work on army, navy and marine corps reservations—was carried forward with increasing scope during the year. At its close, 81 companies had been assigned to this type of work. It involved land clearance, logging and lumbering operations, construction of roads, bridges, telephone lines, airfields, manoeuvre and drill fields, target ranges, utilities systems and buildings, forest protection, mosquito control, landscaping and emergency work. The other CCC companies continued regular conservation operations in forests, parks and wild-life refuges and on farm lands and grazing and reclamation areas. Work projects of about two-thirds of the camps were under the supervision of the department of agriculture and the remaining one-third under the department of the interior.

The demand for CCC-trained men by national defense industries resulted from the all-round program offered in the corps. This included work experience, inculcation of industrial safety practices, development of special skills through the work program, special schools and vocational classes, and physical conditioning. Personnel managers of many large companies gave preference to CCC men, because they knew the men were trained in proper work habits and physically fit to handle a job.

In the conservation field, the CCC planted 2,246,100,600 forest trees since it was established in April 1933. It built 122,168 mi. of truck trails and minor roads, 85,548 mi. of telephone lines, 45,382 bridges, 5,875,578 check dams and 7,073 impounding and large diversion dams. By 1941 it had reduced fire hazards on 2,116,620 ac. of forest lands, spent 6,182,269 man-days in fire prevention and fire presuppression work and 6,304,211 man-days in fighting forest fires. The corps cleaned, developed or built, by 1941, 23,725 springs, wells, water holes and small reservoirs, principally in the western grazing country. It built 82,400 mi. of three-strand fence, enough to reach around the borders of the United States four and one-half times.

The appropriation for the Civilian Conservation corps for the fiscal year ending June 30, 1942, was $246,960,000. Due to the reduction in the number of camps operating, a substantial portion of this sum was expected to be returned to the treasury.

James J. McEntee, a native of New Jersey, was director of the Civilian Conservation corps in 1941. He was charged with the co-ordination of its operations through the war department, which handles camp administration, the departments of the interior and agriculture, which supervise the work projects, and the veterans administration, which selects war veterans who make up approximately 10% of the corps. The office of the director, CCC, is located at 810 18th street, N.W., Washington, D.C. (*See* also VETERANS ADMINISTRATION.) (J. J. McE.)

Civilian Defense, Office of. This office was established as a division of the Office for Emergency Management by executive order on May 20, 1941. Its stated duties and objectives included the co-ordination of federal, state and local civilian defense relationships, planning and execution of programs for the protection of civilian life and property in event of emergency and establishment of opportunities for the training of volunteers in the interests of defense.

The office is headed by the U.S. director of civilian defense who is aided by two advisory bodies: the Board for Civilian Protection and the Volunteer Participation committee. Under the director are nine regional directors whose areas are coterminous with those of the war department corps areas. The regional directors are in direct contact with the state governors and their defense councils which, in turn, are in contact, through state co-ordinators, with city mayors and local co-ordinators. Local co-ordinators, with the aid of their civilian defense committees, are in direct control of the various volunteer units. The latter usually consist of divisions comprising air-raid wardens, emergency fire fighters, auxiliary police, medical and first aid workers, public works and utilities aids, demolition squadrons and public relations workers, as well as volunteers in numerous other vital services. Participation in local units is voluntary, but persons accepting responsibility are obligated to perform their respective duties.

For the purpose of working with states and municipalities, the Division of State and Local Co-operation, which had been created by the advisory commission to the Council of National Defense in Aug. 1940, was embodied in the Office of Civilian Defense. However, state and local defense councils which had been established on the recommendation of the division were not supplanted by the Office of Civilian Defense.

The scope of the civilian defense program is indicated by some of its major activities. Included in civilian protection are divisions for: instruction to the public as to air-raid defense, communication of air-raid warnings, a well trained air-raid warden service, first-aid parties to care for casualties, first-aid posts, casualty clearing stations, ambulance corps, clearance of debris in streets and highways, demolition of unsafe and partially wrecked buildings, rescue of persons trapped in buildings, repair of public utilities such as gas and water mains and wire conduits, detection of poison gas and decontamination of gas areas, provision for housing air-raid defense services, construction of air-raid shelters where necessary, control of light services, evacuation and control of traffic during emergencies, co-ordination of all air-raid defense services, formation of fire and police auxiliary forces, extinguishing incendiary bombs, acquisition of equipment as well as transportation and provision of food and help for air-raid wardens during periods of sustained service. In many instances such service units are under the supervision of local governmental departments; for example, training and supervision of fire auxiliaries is handled by the fire departments, that of police auxiliaries by the police departments. In other instances, however, where duties do not coincide with those of established local departments, personnel is trained in special classes established for the purpose. Foremost among the latter is that of air-raid wardens.

Local civilian defense warden systems differ somewhat in organization, depending upon the size and location of the community. A typical city with a population of 65,000 has a single co-ordinator appointed by the local defense council. Under this co-ordinator is a chief warden for each city ward. Subordinate to them are numerous section wardens, each having a jurisdictional area composed of about 250 families. Reporting to such section wardens are a number of block wardens, at least one for each city block. Heavily populated areas, such as hotel and apartment house districts, have additional unit wardens for each major portion of a building. Under such systems, generally known as block warden systems, every family in the city can theoretically be contacted in case of emergency within a short time, usually less than an hour, even though usual communications be disrupted.

At the end of 1941, about 6,000 local defense councils had been organized throughout the United States. Region 1, comprising the New England states, had the most; and region 8, constituting the southwest states, was next in order. Texas, with about 900 local councils, had the most of any single state. About 1,000,000 persons had been trained, were in training or enrolled in civilian defense activities by the end of the year. The most popular service was that of air-raid wardens with an enrolment of nearly 250,000. Next in order were auxiliary firemen, 112,000; driver's corps, 64,000; food and housing corps, 55,000; and auxiliary police, 50,000. Twenty-seven states had legislation recognizing the state defense councils and defining their responsibilities. The other 21 state councils were functioning under executive orders or appointments from their governors. Two states, Georgia and Wisconsin, utilized their state planning boards.

Director of the Office of Civilian Defense during 1941 was Fiorello H. LaGuardia. Following his retirement after the close of the year, he was succeeded by James M. Landis. Assistant director during 1941 was Mrs. Franklin D. Roosevelt. (*See* also MUNICIPAL GOVERNMENT; MUNITIONS OF WAR: *Air Bombing.*) (X)

Civilian Defense.—*Great Britain.*—The beginning of 1941 saw Great Britain in the midst of a period of heavy night raiding. The continuous raids on London had given place to attacks on certain of the big provincial cities; attacks which were to continue for some time and which switched back to London from time to time.

In order to appreciate the civil defense position at the end of 1941, it is important that the original basis of the organization is remembered; and, also, the new factors which night

WHAT TO DO IN AN AIR RAID

1. KEEP COOL

Above all, keep cool. Don't lose your head.

Do not crowd the streets; avoid chaos, prevent disorder and havoc.

You can fool the enemy. It is easy. If planes come over stay where you are. Don't phone unnecessarily. The chance you will be hit is small. It is part of the risk we must take to win this war.

Until an alarm, go about your usual business and recreation in the ordinary way.

Think *twice* before you do anything. Don't believe *rumors*—spreading false rumors is part of the enemy's technique. Don't let him take you in.

Know your air-raid warning. In general, it is short blasts or rising and falling pitch, on whistles or horns. The "all clear" is a steady tone for 2 minutes. *Watch this paper for description of the local signal.* (This is subject to change.)

Await *official* information before taking any action. When the Air Raid Warden comes to your home, do what he tells you. He is for your protection. He is your friend.

He will help you do your part to whip the enemy.

We can do it. We *will* do it, if we stay calm and cool and strong and alert.

2. STAY HOME

The safest place in an air raid is at home.

If you are away from home, get under cover in the nearest shelter. Avoid crowded places. Stay off the streets.

The enemy wants you to run out into the streets, create a mob, start a panic. *Don't do it!*

If incendiary bombs fall, play a *spray* from a garden hose (never a splash or stream) of water on the bomb. Switch to a stream to put out any fire started by the bomb. Switch back to a spray for the bomb. The bomb will burn for about 15 minutes if left alone, only about 2 minutes under a fine water spray. *A jet splash, stream or bucket of water will make it explode.*

Under raid conditions, keep a bathtub and buckets full of water for the use of the fire department in case water mains are broken.

If you have a soda-and-acid extinguisher (the kind you turn upside down), use it with your finger over the nozzle to make a spray. Don't use the chemical kind (small cylinders of liquid) on bombs. It is all right for ordinary fires.

But above all, keep cool, stay home.

Choose one member of the family to be the home air-warden—who will remember all the rules and what to do. Mother makes the best.

3. PUT OUT LIGHTS

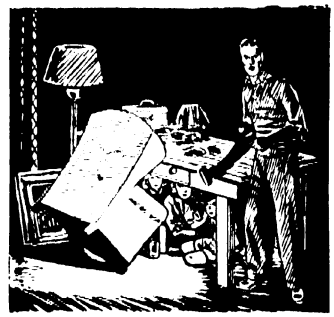
Whether or not black-out is ordered, don't show more light than is necessary. If planes come over, put out or cover all lights at once—don't wait for the black-out order. The light that can't be seen will never guide a Jap. Remember a candle light may be seen for miles from the air.

If you have portieres or curtains, arrange a double thickness over your windows. Blankets will do. If you have heavy black paper, paste it on your windows. Don't crowd or stampede stores to get it, however. You probably have everything you need at home. Be ingenious—improvise.

Should you get an air-raid warning, remember to shut off gas stoves, gas furnaces, and gas pilot lights on both. Bomb explosions may blow them out from blast effect. Gas that collects may be explosive later.

Prepare one room, the one with the least window glass, in the strongest part of your house, for a refuge room. Put food and drinking water in it. Put a sturdy table in it. Put mattresses and chairs in it. Take a magazine or two, and a deck of cards, into it. Take things like eyeglasses and dentures with you when you go into it. Take toilet facilities, paper, a screen. If you have a portable radio, take that too. Above all, *keep calm. Stay at home. Put out lights.*

4. LIE DOWN



If bombs start to fall near you, lie down. You will feel the blast least that way, escape fragments or splinters.

The safest place is under a good stout table—the stronger the legs the better.

A mattress under a table combines comfort with safety.

The enemy may use explosive bombs or incendiary bombs, or both. If incendiaries are used, it's more important to deal with them than to be safe from blast. So defeat the incendiary with a *spray* (never a splash or stream) of water, then go back to safety under a table in a refuge room.

Most raids will likely be over *in your immediate neighborhood* in a short time. However, stay under cover till the "all clear" is sounded.

Know your raid alarms. Know the all clear. Official news of these will come to you from your Air Raid Warden. Don't believe rumors. Watch this paper for air raid alarm description. Ask the warden when he comes.

Should your house be hit, keep cool. Answer tappings from rescue crews if you are trapped. (You most likely won't be either hit or trapped, but if you are, you can depend on rescue squads to go after you.) Again—keep cool, and wait. Don't yell after you hear them coming to you, unless they tell you to. *Keep cool!*

Just keeping cool hurts the enemy more than anything else you can do. *Keep calm. Stay at home. Put out lights. Lie down.*

5. STAY AWAY FROM WINDOWS

Glass shatters easily, so stay away from windows.

Don't go to windows and look out, in an air raid. It is a dangerous thing, and helps the enemy. The Air Raid Warden is out there watching for you. Again we say, get off the street if planes come over.

At night, there is danger of being caught in blast from explosives.

Antiaircraft fire means falling shrapnel. You are safe from it indoors, away from windows. It's more important to shell a plane than it is to see it from a window. Do not say—we are repeating; we would rather repeat until we bore you than have you forget.

Stay in your refuge room, away from windows. That is the safest place. Go there at the first alarm; stay there until the all clear.

Above all, *keep calm. Stay home. Put out lights. Lie down. Stay away from windows.*

You can do all those things without any special equipment, other than what you have now in your home.

You can help lick the Japs, with your bare hands, if you will do just those few, simple things.

Be a good fellow and follow instructions and keep well.

Do not be a wise guy and get hurt.

6. YOU CAN HELP

Strong, capable, calm people are needed to man the volunteer services. If you want to help, there are lots of opportunities.

If you know first aid, and have a certificate, there is an immediate job for you. If you are a veteran, or a former volunteer or regular fireman, or policeman, there is work for you. If you have no special skills but are strong and husky, there is a job for you in rescue squads, road-repair units, or demolition and clearance squads. If you have and can drive a car, you may be needed for drivers' corps. Older Boy and Girl Scouts over 15 can help as messengers. Both men and women are needed.

Here's how to get started:

If there's a Civilian Defense Volunteer Office in your community, call there and ask where to report. If not, call your local Defense Council or Committee, or the Chamber of Commerce. Phone and ask where to report, rather than going in person.

PRIMARY LESSONS in self-protection during air raids, as pointed out in a pamphlet issued in Dec. 1941 by the U.S. Office of Civilian Defense. The pamphlet is illustrated by Milton Caniff, creator of the comic strip "Terry and the Pirates."

bombing on a continuous and heavy scale were to introduce.

The civil defense organization, or A.R.P., as it was then called, was designed to meet heavy, although not prolonged day and night raids by hostile aircraft based on German territory. Furthermore, it was anticipated that such raids would, in the main, be most effective in the eastern half of Great Britain, although with the increasing range of aircraft it was realized that no part of the country could be considered to be immune from such attacks.

The occupation of Norway, Denmark, the Low Countries and France brought about a very radical change, however, in the strategical dispositions of the *Luftwaffe*; and consequently in the relative vulnerability of the different parts of the country and the weight of attack to which it might be subjected. It was also possible for the enemy air force to increase greatly the duration of their attacks.

The problem of invasion assumed an entirely new complexion and was not without its repercussions on civil defense.

Finally when the "battle of Britain" was fought and the royal air force emerged triumphant the enemy was forced into concentrating his efforts into the hours of darkness which again had an important bearing on the civil defense organization.

It was, then, against this background, without actual experience and faced with a far greater peril than had been envisaged, that the civil defense organization went into action. And by the beginning of 1941, the new problems which German strategy had produced were rapidly becoming clear. In the main they showed: that the organization to deal with the needs of the community after a heavy raid required greatly to be expanded; that the menace of fire was great and that the organization to deal with incendiary bombs before they had time to start large fires had also to be largely extended; how important it was for shelters in target areas to be provided with proper sleeping facilities, including sanitary conveniences, heating, and, in larger shelters, first-aid posts; the heavy burden on rescue parties and the extent to which the government had to supplement local resources.

By the end of the year, and with the relief from heavy night raiding resulting from the concentration of German effort against Russia, great strides had been made.

The pivot of civil defense is the ministry of home security. And, although departmentally its main responsibility is for the administration and operation of civil defense services, a responsibility shared with the ministry of health and department of health for Scotland as regards the casualty services, it deals also with other precautions against air attack; *e.g.*, lighting restrictions, experimental work and erection of shelters.

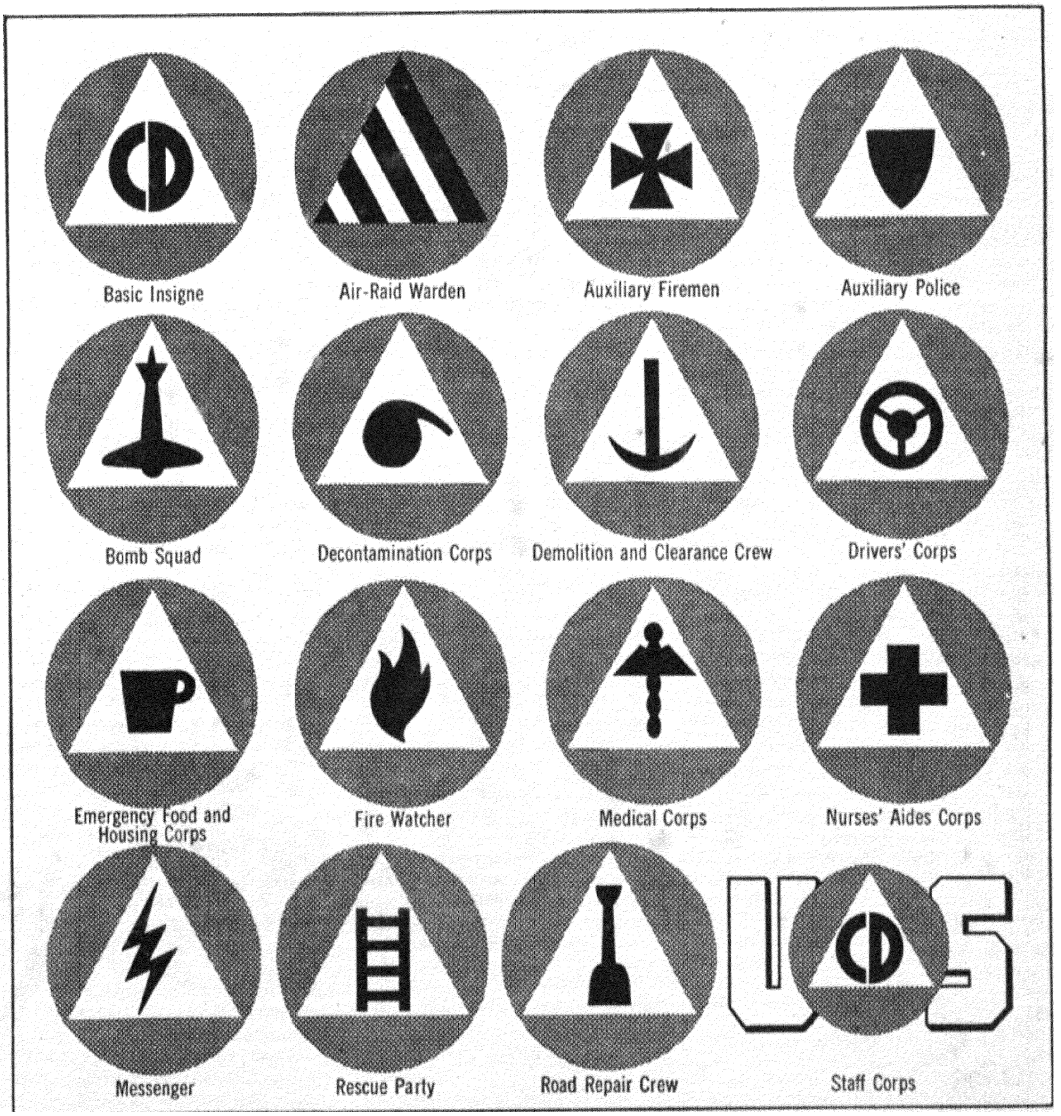
The minister exercises, moreover, a co-ordinating function over other ministries whose activities deal in one way or another with the restoration of the situation after heavy attack. In fact the battle has come to be regarded in two distinct phases: operations to save life and property during the attack and the restoration of the life of the community after the attack has ceased. The first phase concerns particularly the ministries of home security and health; the latter a wide range of ministries, including again the ministry of health for such matters as evacuation, billeting, rehousing, rest centres, eating supplies and first-aid repairs to buildings, with the department of health for Scotland carrying out similar functions north of the Tweed, the ministry of war transport for shipping, docks, railways, roads and electricity, the ministry of food, the ministry of works and buildings for supply of materials and allocation of labour for repairs needed as the result of raids.

In addition, the service ministries are responsible for adequate passive air defense measures in all factories, arsenals and similar establishments coming under their control; and the ministry of labour for all other factories.

The necessary co-ordination of all these diverse activities is effected by means of ministerial and departmental committees.

England has been divided up into 12 regions of convenient size, each operating under a regional commissioner who works directly under the minister of home security. The regional commissioners have their headquarters at a convenient centre in their region. Scotland is subdivided into five districts, each in charge of a district commissioner working direct to the regional commissioner in Edinburgh. Wales has two joint commissioners, one of whom is located permanently in north Wales, while London has three commissioners and is divided into groups, each comprising a convenient number of local authorities and having a group co-ordinating officer with a small staff working direct to regional headquarters. London has also a special commissioner for the homeless and another for clearance of debris and the supply of labour for after-raid work.

Regional commissioners have normally two deputies, a principal officer and a considerable staff to deal with administration, inspections and technical matters. Although under normal conditions they work direct to their own ministries, there are a number of regional representatives of the other departments concerned in civil defense. They work in close touch with the regional commissioner who has also a co-ordinating responsibility:



INSIGNIA worn by U.S. civilian defense workers

CIVILIAN VOLUNTEERS rehearsing in 1941 at the information centre of the U.S. army air defense board in New York city. As operators, informed by observers, locate the attacking planes on the map, officers in the booth above telephone instructions to anti-aircraft batteries and interceptor planes

under certain circumstances these representatives would act directly under the commissioner's orders. Every commissioner has also a military and R.A.F. liaison staff.

Under the regional commissioners work the local authorities, who are divided into two broad categories: scheme making and nonscheme making. It is the former who work direct to the commissioners. The remainder of so-called nonscheme-making authorities are administered direct by the county councils, although the councils do in practice delegate responsibility. In addition there are certain matters on which the smaller local authorities have specific responsibilities and work direct to the regional commissioner; *e.g.*, fire prevention, first-aid repairs to houses.

All local authorities down to rural district councils have a civil defense organization varying in strength according to their size, population and estimated vulnerability.

All scheme-making authorities and important nonscheme-making authorities have a controller, who is responsible for the operation of the civil defense services; and an emergency committee, normally composed of three or four members of the local council, to whom have been delegated wide powers by the authority to act on its behalf on matters of civil defense. They are also responsible for co-ordinating all the arrangements for the restoration of the situation after a heavy raid, although for this purpose additional members are often co-opted to cover the wide range of the problem.

The chief civil defense services working under the controller are the wardens, rescue, decontamination, first aid, ambulances, control and report centre staffs, messengers and gas identification officers.

In addition, organizations have been created to man rest centres, mobile canteens, information bureaus, rehousing, billeting, salvage and other after-raid requirements. In certain cases local representatives of central government departments are associated with this side of the work; *e.g.*, assistance board.

Hospitals, ambulance trains and nonlocal ambulance services are administered and operated at a regional level by the ministry of health.

So far as the fire service is concerned a radical change has been made. A national fire service has been formed and the service was in 1941 operated and administered under central control instead of being a local authority service. The fire services operated in 43 forces each under a fire force commander.

Finally an organization of fire guards was introduced throughout the country, which is regarded as a complementary organization to that of the national fire service. It was linked closely with the wardens' service, and its task was to deal with incendiary bombs when they fell and to endeavour to prevent the starting of serious fires. (*See* also AIR RAID SHELTERS; GREAT BRITAIN: *Civil Defense.*) (E. J. H.)

Civil Liberties. Whereas U.S. involvement in previous conflicts usually meant widespread suppression of alien ideas and people (compare the notorious Palmer raids during World War I), and although similar suppression was feared for World War II, scrupulous adherence to the bill of rights on the part of the federal department of justice, including specifically the F.B.I., plus a widely publicized general governmental attitude of tolerance toward loyal foreigners resulted in few charges of alien baiting or persecution even being made—and this despite the fact that compulsory registration of all aliens as a measure of national defense revealed that there were up-

wards of 5,000,000 of them in the United States. The Dies committee of the house of representatives and the Rapp-Coudert committee in New York state (investigating teachers) continued their investigations into alleged subversive activities on the part of governmental employees. The shift in the communist party line from opposition to the United States war policy to active support of the governmental effort in the war, a shift occasioned by the German invasion of the soviet union, meant that in the second half of the year there were fewer claims of suppression on the part of the communists and also fewer efforts to suppress them. However, prosecutions for sedition commenced earlier in the year against the Trotskyite group in Minnesota resulted in convictions which were (Jan. 1, 1942) pending on appeal. It was expected that the eventual decision in the case would declare the permissible limits of the Smith "military disaffection" bill.

Supreme Court.—During 1941 the supreme court handed down a number of decisions further expanding the effective meaning of the Bill of Rights. Notable among them were decisions (a) holding squarely that the right to picket was included within the constitutional guarantees of free speech and free press; (b) declaring in clear terms the right of U.S. citizens to roam freely throughout the nation regardless of state laws against admission of indigents; and (c) confining punishment of newspapers and individuals for contempt of court to situations "where there is a clear and present danger of interference with justice." State courts followed in the liberal trend. An intermediate court in New Jersey held unconstitutional the New Jersey anti-nazi statute of 1935 which sought to gag expressions of racial and religious hatred. Also, courts in Massachusetts, New Hampshire and New York, despite the 1940 holding of the United States supreme court that public school students could constitutionally be compelled to salute the flag, upset orders of lower courts in those states committing to reform schools children of Jehovah's Witnesses who refused to salute the flag in public schools.

Radio.—The chief development in the radio field was the regulations promulgated by the Federal Communications commission on the basis of the commission's so-called "Monopoly Report." The validity of these regulations which were designed to effect greater diversity of control over the air waves was (Jan. 1, 1942) being contested in court. The commission also held hearings on the joint ownership by the same interests of newspapers and radio stations with a view to determining whether public policy was served by such joint ownership, but no regulations were issued.

Motion Pictures.—A proposed senatorial investigation into the propaganda content of Hollywood motion pictures proved abortive and was abandoned. In the field of motion picture censorship an important victory was achieved in New York when the state board of regents reversed a ban imposed by the board of censors on the Steinbeck-Kline film of Mexican life entitled *The Forgotten Village*. The major film companies, however, continued to avoid any censorship fight and meekly made changes recommended by local censors in such pictures as Garbo's *Two-Faced Woman*, forbearing to fight even in Providence, R.I., where the local police chief who did the censoring admitted that he had not even seen the picture.

Birth Control.—The legal status of medically prescribed birth control continued to be unsettled in both Connecticut and Massachusetts, although in both states efforts to obtain further clarification were still under way. By way of contrast the states in the deep south continued to expand their public health service to include contraceptive technique.

The American Civil Liberties Union, which continued to be the dominant agency in the field of civil liberties, concluded its survey for 1941 with a statement that "Liberty in the United States has never rested upon firmer legal foundations." (*See* also LAW: *Civil Rights.*) (M. L. E.)

Civil Service. One of the principal features of development in U.S. public service during 1941 was the marked expansion resulting from the requirements of defense and war. A few illustrative figures will make clear the increase in federal employment. In Jan. 1940 total federal employment was 939,000; in June 1940 it passed the 1,000,000 mark; in Jan. 1941 it had risen to 1,151,000; and in Oct. 1941 it slightly exceeded 1,500,000. State and local employment remained stationary in 1941.

These great increases were due in considerable measure to the expansion in civilian employment of the war and navy departments. In July 1940 civilian employees of the war department numbered 141,000; in Jan. 1941 this number had increased to 204,000; and in Oct. 1941 to 415,000. The civilian roll of the navy showed great, although not quite such extraordinary, expansion. In July 1940 its number of civilian employees was 126,000; in Jan. 1941 the number had increased to 176,000; and in Oct. 1941 to 264,000. By Dec. 30, 1941, these figures had substantially mounted.

Early in the defense program the decision was made to require defense and emergency employees to possess civil service status as far as possible. The U.S. civil service commission in 1941 was engaged upon the most extensive recruitment and placement program in its history, exceeding in scope the war expansion of 1917–18. Army and navy officials expressed complete satisfaction with the assistance received from the commission. The civilian defense agencies, such as the Office of Production Management, tended to employ men with business experience, without using the services of the civil service commission; but by the end of 1941 these agencies had become convinced of the necessity of a central corps of management personnel familiar with government procedures, and possessing civil service status.

U.S. civil service employees on June 30, 1941, numbered 990,000; employees exempt from civil service, 367,000. Both these figures increased substantially during the last six months of 1941.

An important new development in facilitating the supply of professional and scientific personnel became available in 1941—the National Roster of Scientific and Professional Personnel. This census and listing of professional and scientific personnel included at the end of the year more than 200,000 names, and many thousand important appointments to the federal service had been made from it. The roster seemed likely to have earned a permanent place in the recruiting procedures of the federal government for professional and scientific employees.

During the year the merit system continued to expand. An executive order of April 23, 1941, put into effect the Ramspeck act, covering in the federal civil service about 125,000 positions, effective Jan. 1, 1942. By the same executive order the president directed the appointment of a board of legal examiners and the extension of the merit system to federal attorney positions, in accordance with the recommendations of the majority of the president's committee on civil service improvement. In the states there was considerable improvement, although the state-wide merit systems still suffered from considerable hostility. Kansas adopted a state-wide merit system. Indiana adopted a merit system including state institutions, the department of health, the department of public welfare, county welfare organizations, unemployment compensation, the employment services and the state library. These gains were somewhat counterbalanced by the outright repeal of the New Mexico State Civil Service act of 1939 and by amendments to the Rhode Island Civil Service act which were unfriendly to the merit system, although in several instances in harmony with acceptable civil service practice.

During 1941 the installation of state merit system councils for state agencies, co-operating with the Social Security board, was completed, thus laying the foundation for a nation-wide demonstration of the value of the merit system in state and county government.

The New York state legislature enacted an important piece of legislation extending the merit system to all units of local government, expanding somewhat the authority of the state civil service commission and allowing localities either to adopt one of several optional forms of the merit system or to authorize the state civil service commission to operate the local system.

A considerable shortage of personnel experts developed during 1941, emphasizing the nation-wide search for talent in the personnel field. United States civil service examinations were announced for executive officers with salary ranging from $3,800 to $8,000, for training specialists, ranging from $3,200 to $5,600, and for personnel assistants, ranging from $2,300 to $3,800. The Louisiana state civil service commission announced a nation-wide examination for director of personnel at $7,500, the Kansas state commission a corresponding examination with a salary range from $4,000 to $6,000, and the Illinois state civil service commission an examination for executive officer at $5,000. In the municipal field, an examination for director of the reorganized St. Louis civil service agency was announced at $6,000, and Los Angeles continued its established practice by announcing an examination for personnel technician from $1,800 to $2,000. These examinations tended strongly to support the concept of a career service in the personnel field. At the end of 1941 the shortage in personnel men was even more marked.

Two important technical improvements occurred during 1941. Under the provisions of the Ramspeck act, appeals boards were established in each federal department and agency to hear appeals on service ratings. The composition of these boards was significant: the chairman was appointed by the civil service commission from its own staff, one member was appointed by the department or agency, and one member was elected by the employees of the department or agency. These boards were organized and ready to get into action in 1942.

The second technical improvement was the introduction of a plan for periodic increase of salary for federal employees, thus making general a practice which had already been established in a number of important agencies.

The proper status and function of union organizations in the public service continued to give rise to differences of opinion. The National Civil Service Reform league issued an important statement differentiating between the status of industrial and public-service unions, supporting the right of organization in the civil service but denying the privilege of collective bargaining, closed shop and the strike. The issue was particularly acute in New York city as a result of municipal ownership of the subway system. Previously existing collective agreements were declared by Mayor La Guardia to be incapable of fulfilment under municipal ownership and operation. The Transport Workers union took the position that it retained all its rights and privileges despite municipal ownership. At the end of 1941 the issue was pending before the courts. (L. D. W.)

Claussen, Julia (1879–1941), Swedish mezzo-soprano, was born June 11 in Stockholm. She made her debut at the Royal Opera house in Stockholm in 1903 and sang there for the next ten years. In 1913 she went to the United States, sang with the Chicago Opera company, 1915–16, and from

1917 to 1932 was with the Metropolitan in New York city, where she was famed as a singer of Wagnerian operas. King Gustavus V of Sweden bestowed the title of royal court singer upon Mme. Claussen in 1923. After her retirement from the stage, she taught music in Sweden and appeared occasionally as guest singer in the Royal opera. Mme. Claussen died at her home in Stockholm, May 1.

Clay, Laura (1849–1941), U.S. suffragist, was born Feb. 9 on a farm in Madison county, Ky. Her father, Gen. Cassius M. Clay, was a cousin to Kentucky's famous statesman, Henry Clay. After graduating from Kentucky State college—now Transylvania college—Miss Clay plunged into the movement to secure equal suffrage for women. She helped found and became first president of the Kentucky Equal Rights association in 1888. Through the efforts of this group, married women in Kentucky won the right to own property. Miss Clay then carried the fight for equal suffrage throughout Indiana, Ohio and Kansas, winning many converts to the new movement. At the Democratic National convention in 1920 she received one vote on the 36th ballot and thus became the first woman to receive a vote for the presidential nomination. She died at her home in Lexington, Ky., June 29.

Clay. No statistics are collected which include the total output of all types of clays in the United States, as the greater portion of the output is used directly by the producer in the manufacture of brick, tile or other heavy clay product. Sales of clays not used by the producer in 1940 increased 23% over 1939, to 4,847,519 short tons, valued at $19,633,568, a decrease of 15%. Imports are comparatively small, usually of the order of 5% of production, and exports are even less; conditions in 1941 upset the usual trend, however, with imports decreasing and exports increasing, leaving a net export for the year. The total reported includes kaolin, china clay, ball clay, fire clay, stoneware clay, bentonite (*q.v.*), fuller's earth (*q.v.*) and various minor types. (G. A. Ro.)

Cleveland. Sixth largest city of the United States, Cleveland, O., had a population of 878,336 by the federal census of 1940. Area, 73·74 sq.mi. Cuyahoga county, which includes Cleveland and its major suburbs, had a population (1940) of 1,217,250.

Former Common Pleas Judge Frank J. Lausche (Dem.) polled 145,108 votes to defeat Mayor Edward Blythin (Rep.), who received 94,767 votes in the November election. It was the largest margin ever recorded in a Cleveland mayoralty election. Republicans retained theoretical control of the city council, although their majority was reduced by the election.

Mayor Lausche appointed to his cabinet Thomas A. Burke, Jr., as law director, Eliot Ness as safety director, Joseph T. Sweeny as finance director, William D. Young as public utilities director and Samuel T. David as director of public service. As an economy measure the mayor discharged 50 city employees in the opening weeks of his administration.

Sheriff Martin L. O'Donnell, 54, died of a heart attack June 22, in the midst of a campaign by the Cleveland Bar association to remove him from office for alleged failure to close gambling clubs. County commissioners appointed Joseph M. Sweeney, a Cleveland detective inspector, to succeed him.

Appointment of Emerich B. Freed, who had been United States attorney in the Cleveland district for eight years, as judge of the United States district court was confirmed by the senate Oct. 2. Don C. Miller was nominated by President Roosevelt to succeed Freed as district attorney. U.S. Attorney General Francis Biddle named Henry A. Hauxhurst, Col. Otto Miller and Francis R. Bacon as the alien enemy hearing board for the Cleveland district.

Increased revenues enabled the board of education to restore in Dec. 1941 the 10% salary cuts it voted for employees in June.

Stockholders of the Cleveland Railway Co. in November authorized sale of the street railway system to the city government on the basis of the city's offer of $45 a share, or a total of $14,127,280. To conclude the transaction, the city was to sell bonds to cover that amount.

Under the impetus of defense contracts, business reached a new peak in Cleveland in 1941. Industrial expansions and improvements in the 18 months ending Dec. 31, 1941, exceeded $150,000,000. Cleveland probably is the greatest aeroplane parts centre in the U.S. and factories in 1941 were working on more than $1,000,000,000 of direct and indirect defense orders. Employment increased 35%. Fifty-four new companies started operating in Cleveland, using 323,415 sq.ft. of manufacturing space. To house defense workers, 7,270 new home units were erected at a cost of $45,988,432. By the close of the year, the $6,000,000 Cuyahoga river widening project was virtually completed to enable iron-ore carriers to go up the river in 1942 in the race to keep the steel mills supplied.

Cleveland postal receipts reached an all-time high of $10,250,000 in 1941, and income tax collections more than doubled those of 1940. Union Trust Co. depositors received a liquidating dividend which brought the pay-off to 90%, while depositors of the Standard Trust bank received a final liquidating dividend which brought the total payment to 78½%. (P. By.)

Clifford, Sir Hugh (1866–1941), British colonial governor, was born March 5 in London. Sir Hugh resigned from the colonial service in 1929 after a 26-year career as government official. He was also known as a scholar and writer and authority on the east, particularly Malaya. Among his books are *Some Reflections on the Ceylon Land Question* (1927) and *Bush-Whacking and Other Asiatic Tales and Memories* (1929). He died Dec. 19. (*See Encyclopædia Britannica.*)

Climate: *see* METEOROLOGY.

Clothing Industry. Production and retail sales in 1941 increased over 1940; so did military garment production. Because of industrial activity there were greatly increased sales of work garments. Slack and shirt combinations continued to be favourites for summer wear. Regular clothing followed the past seasons with comfortable semidrape effects. Sportswear was important, emphasizing special garments for individual sports. Popular ski wear featured colourful, light and heavyweight materials in designs to give freedom of action.

The textile market suffered from defense preparations. Price ceilings and a woollen conservation plan were put in operation. In December the industry was faced with the necessity of altering clothing designs to meet fabric shortages, presaging the abolition of some clothing elements hitherto considered standard. New fibres were developed to bolster the market. Increased importation of woollens was expected to be necessary.

The trimmings industry was greatly affected by the war. Thread, buttons, linings, etc., were more difficult to obtain; slide fastener production was reduced. Needles became scarce.

Machinery manufacturers continued developing laboursaving devices. New shirt-pressing conveyors, folding, creasing, button-sewing, clothes-pressing and cloth-laying machines were offered to manufacturers. In addition the straight-line system of production patents was purchased and made public property.

The government standardization of boys' sizes was accepted by the retailers and in the future all boys' clothing would be sold on a

hip-girth and height basis rather than the former age size system. This would greatly aid the consumer.

The end of the year brought priorities to the clothing industry. Americans were expected to be warmly clothed, however, during the war years and the American soldier would continue to be the best-dressed soldier in the world.

For 11 months of 1941, with 56% (based on value) of the clothing industry reporting, total units cut (including suits of wool, cotton, linen, mohair, trousers and knickers, overcoats, topcoats and separate coats, but not including dress pants, work clothes, shirts, leather garments, pajamas and very heavy coats) in the men's, young men's and boys' regular clothing industries totalled 25,949,000 compared with the 1940 11 months figure of 25,208,000. Cuttings in 1941 in the garment field were considerably higher than in 1940; these cuttings were (based on 77% of the value of total production): overalls and industrials, 6,397,717 dozen; work and semidress pants, slacks and shirts, 6,913,882 dozen; lined and leather coats, lumberjacks, mackinaws, ski suits, snow suits, hunting coats, oiled garments, shirts, pajamas, wash suits, and miscellaneous, 23,132,000 dozen. Uniform cuttings in April to Nov. 1941, inclusive, under government contract, totalled approximately 13,786,000 pants, coats and overcoats combined.

British manufacturers in 1941 had to turn 85% of their production over to military clothing. A coupon rationing system was imposed on the consuming public under which better-made clothing flourished and work garment production increased.

(H. Sn.)

Cloves: *see* Spices.

Coal. Coal production data have been so scarce that it has been impossible to estimate world production since 1938, when it was 1,469,000,000 metric tons. However, since about three-quarters of the normal output comes from Germany, United States, Great Britain and U.S.S.R., it may be pretty safely assumed that the magnitude of the war effort in those countries will have resulted in some increase, though production in countries like Czechoslovakia, Poland, Belgium, the Netherlands and France has declined. Data were available from only a few countries outside the United States, and in those production was comparatively small.

Table I.—*Coal Production of the World*

(Millions of metric tons—all grades)

	1929	1932	1937	1938	1939
Canada	15.87	10.65	14.37	12.97	14.08

Total	1,559.00	1,124.00	1,550.00	1,469.00	?

United States.—Production of coal in the United States in 1940 increased 13% over 1939, to 503,300,000 short tons, and preliminary estimates for 1941 indicated a 10% increase over 1940, to 556,500,000 tons; this total included 501,000,000 tons of bituminous, an increase of 11% over 1940, and 55,500,000 tons of anthracite, an increase of 6% over 1940. This was the highest total attained since 1930, but was still a far cry from the 678,812,000 tons reached by the war peak of 1918. Production during most of the second half of 1941 was at a rate approximating 630,000,000 tons for the year, but this was reduced to the figure estimated above, by the following losses: 9,000,000 tons during the first quarter while production was building up; 50,000,000 tons during the second quarter while new contracts were being negotiated; 12,000,000 tons in vacation and holiday periods during the year; and 3,000,000 tons during the captive mine strike during November, a total of 74,000,000 tons lost during the year, as compared with what might have been produced.

Taking the year as a whole, production conditions were much less stable than in 1940, and fluctuations in output were far greater. The distribution of production by states is shown in Table II, the data for 1941 being estimated from incomplete returns.

Table II.—*United States Production of Coal*

(Millions of Short Tons)

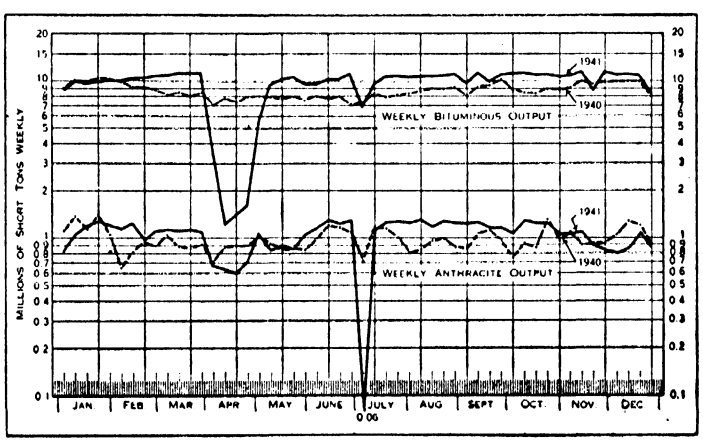
	1929	1937	1938	1939	1940	1941
Alabama	17.9	12.4	11.1	12.0	15.2	15.1
Colorado	9.9	7.2	5.7	5.9	6.5	6.8
Illinois	60.7	51.6	41.9	46.5	49.5	53.2
Indiana	18.3	17.8	14.8	16.7	18.6	22.4
Kentucky	60.5	47.1	38.5	42.8	48.4	53.0
Ohio	23.7	25.2	18.6	19.6	22.1	29.5
Pennsylvania	143.5	111.0	77.7	92.2	112.9	121.1
Tennessee	5.4	5.2	4.5	5.3	6.0	6.7
Utah	5.1	3.8	2.9	3.3	3.5	3.9
Virginia	12.7	13.8	12.3	13.2	15.0	17.9
West Virginia	138.5	118.6	93.3	107.9	126.3	139.0
Wyoming	6.7	5.9	5.2	5.4	5.7	6.5
Others	32.1	25.9	22.1	22.3	23.6	26.0
Total Bituminous	535.0	445.5	348.5	393.1	453.2	501.0
Anthracite	73.8	51.9	46.1	51.5	50.1	55.5
Grand Total	608.8	497.4	394.6	444.6	503.3	556.5

Although none of the more important producing states showed a decrease in output in 1941, the bulk of the improvement was in West Virginia and Pennsylvania, since those are the heaviest producers. It is also to be noted that while the 1941 total was well below that of 1929, Indiana, Ohio, Tennessee, Virginia and West Virginia equalled or exceeded their 1929 outputs.

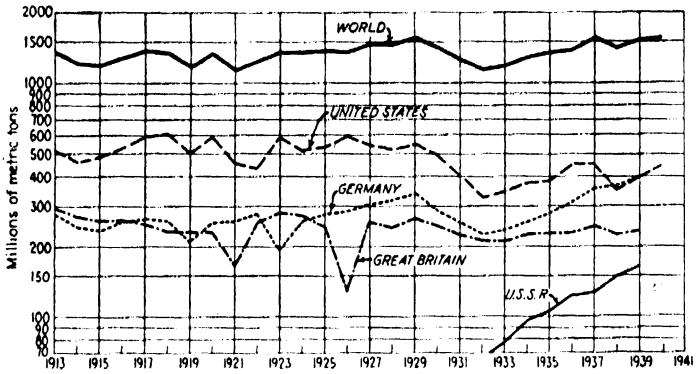
The accompanying graph of weekly production indicates the trend throughout 1941, both for bituminous and for anthracite coal. The break in both curves in the first week of July included not only the usual Fourth of July holiday, but also marks the beginning of the vacations granted miners in some areas, which accounts for this break being larger than that for any of the other holiday weeks.

There is normally little foreign trade in coal; imports, usually well under a million tons, were 545,000 long tons in 1940 and 630,000 tons for the first three-quarters of 1941; exports ran somewhat higher, at 19,434,000 tons in 1940 and 16,248,000 tons in the first three-quarters of 1941; these figures included bunker fuel and the coal equivalent of coke.

Canada.—Coal production to the end of Oct. 1941 was 14,535,316 short tons, as compared with 14,016,547 tons in the same period of 1941; this was at an average rate of 17,442,000 tons for



WEEKLY PRODUCTION of anthracite and of bituminous coal in the U.S., 1941



COAL PRODUCTION OF THE WORLD and the major producing countries, as compiled by *The Mineral Industry*

the year, but as production toward the end of the year was higher than earlier, the year's total was expected to approximate 18,000,000 tons, and might possibly somewhat exceed this figure, in comparison with 17,551,000 tons in 1940.

South Africa.—An output of 10,621,639 short tons was reported in the first half of 1941, an increase of 18% over the same period of 1940; the 1940 total was 18,934,000 tons.

Minor Producers.—Chile produced 900,000 metric tons in the first half of 1941, Netherlands East Indies the same, and Spain 4,200,000 tons, India 6,375,000 tons in the first quarter, and Turkey 1,037,000 tons to the end of April. Lignite production was 5,482,000 metric tons in the first half of 1941 in Hungary, and 1,061,000 tons in Rumania. (*See* also FUEL BRIQUETTES.)

(G. A. Ro.)

Coast and Geodetic Survey, U. S.

The surveying and charting of the coastal waters of the United States and the production of nautical charts and coast pilots for navigation during 1941 were conducted entirely in accordance with the needs of the national defense. Comprehensive tide and tidal current observations and the investigation of the earth's magnetism were a part of this program. Requirements of the land and military forces received attention through close co-operation. New aeronautical charts were produced for air navigation and geodetic control surveys extended in areas desired by the army for training and for defense mapping.

The rapid expansion of the land, sea and air forces taxed the resources of the bureau to provide sufficient surveys to meet new demands. Modern survey methods in areas needed for naval operations resulted in discovery of dangers to navigation of utmost importance to large-scale chart construction. Three series of aeronautical charts were maintained with standard information vital to pilot training courses and for general air navigation. A threefold increase over the normal requirements of the military services was noted in the number of aeronautical and nautical charts issued.

The ship "Explorer," following the 1940 trial season in western Alaska, successfully accomplished extensive surveys in the vicinity of the Aleutian Islands. This ship was designed to perform combined surveying operations in isolated waters where long cruises away from supply bases might be required. It is completely equipped with the latest devices for shoal and deep water hydrography and for auxiliary operations. The "Explorer" is the most modern survey ship afloat.

The year 1941 was especially marked by the productive results obtained from the installation of many new surveying devices which had been under design, development and trial in the past few years. Among these, the most important were the Dorsey fathometer No. 3 and the automatic depth recorder to supplement the fathometer. The technique of shoal water hydrography has been completely altered by the extensive use of these improved echo sounding machines. A new portable tide gauge, thermostatic control of gravity pendulum apparatus and a transit magnetometer attachment were perfected.

There was inaugurated in 1941 a program of scientific co-operation with various American republics, by tidal measurements initiated in eight of these countries and by a comprehensive series of observations of gravity and location of base stations in Peru and Colombia. These projects were performed with coast and geodetic survey methods and American instruments under arrangements for participation by technical personnel in the countries visited. From the cordial reception received it is indicated that further scientific projects will be undertaken, to the material advantage of the scientists of the western hemisphere.

(L. O. C.)

Coast Guard, U.S.

The activities of the United States coast guard were considerably expanded during 1941.

The more outstanding of the year's activities may be summarized as follows: An increase in the number of authorized enlisted men in the service; an increase in the size of the entrance class at the Coast Guard academy and the expansion of the academy's physical plant; a stepping up of the tempo of the training program for enlisted personnel; co-operation with the navy, consisting of the supplying of ships and personnel for various special duties; augmentation of the coast guard fleet of vessels constituting the greatest shipbuilding program in the history of the service; an increase in the force at the coast guard yard at Baltimore for the reconditioning and rearmament of ships; the construction of building ways and a floating drydock at the coast guard yard and the erection of new buildings necessary for the construction of ships; the active participation by ships, small boats and planes in the neutrality patrol; the increase in the number of officers serving as captains of the port and a substantial expansion of the duties of such officers; the reorganization of the former nonmilitary coast guard reserve into the present coast guard auxiliary, and the setting up of a full military coast guard reserve as a result of recent legislation.

Other activities of 1941, hardly less important, were: special efforts to expedite the opening of navigation upon the Great Lakes as a national defense measure; the assumption of the operation of a national system of radio direction finder stations of great use to shipping as well as a valuable adjunct of the nation's coastal defenses (previously maintained by the navy); an increase in the number of aids to marine navigation over and above the normal annual expansion; the marking of foreign waters adjacent to recently acquired naval bases to facilitate the movement of United States ships; and the rebuilding of a number of coast guard vessels to provide the dual capacity of maintaining navigational aids and performing patrol duties.

In 1941 the coast guard had under construction in private shipyards the following ships and boats: one 230-ft. ice-breaking tender; seven 180-ft. ocean-going tenders; three 113-ft. river tenders; two 110-ft. harbour cutters; one 110-ft. barge; one 73-ft. river tender; one 65-ft. buoy boat; forty 83-ft. patrol boats; and one 300-ft. floating drydock.

Coast Guard Academy.—Appointment of 146 cadets to the Coast Guard academy followed the holding of competitive examinations in May 1941. A total of 1,771 candidates competed in this examination. The group actually appointed represented the second largest entering class in the history of the academy. The largest class (147 cadets) entered in 1940.

The congressional board of visitors, after its annual inspection of the academy in May 1941, expressed itself as pleased with the high type of educational institution maintained by the coast guard for the training of its future officers and with its curriculum ably supervised by the advisory committee com-

U.S. COAST GUARDSMEN boarding a German tanker in Boston March 30, 1941 after President Roosevelt ordered the seizure of 28 Italian, two German and 35 Danish merchantmen tied up in U.S. ports

posed of five leaders in the field of education. The congressional board recommended the construction of a chapel at the academy.

During 1941 extensions to the cadet barracks and the library were constructed, providing the necessary additional space for the increasing number of cadets.

On April 12, 1941, the Coast Guard academy received as a gift the schooner "Atlantic" from Gerald B. Lambert, rear commodore of the New York Yacht club. The "Atlantic" is a three-masted steel schooner of 303 gross tons, with masts 147 ft. high. It is 185 ft. long overall, with a breadth of 29 ft., and has a reciprocating steam engine of 250 h.p.

The annual practice cruise of the first and third classes took place during the summer aboard the "American Seaman." During this cruise the cadets visited St. Thomas, Virgin Islands; San Juan, Puerto Rico; Kingston, Jamaica; and United States ports along the Atlantic coast.

Enrolment at the beginning of the fall semester in 1941 was 341, of which 31 were in the first class, 73 in the second class, 92 in the third class and 145 in the fourth class. (R. R. W.)

Cobalt. The cobalt-bearing products formerly shipped from the Belgian Congo to Belgium for treatment were being shipped to the United States, where they are smelted along with smaller amounts of Canadian material. As a result, imports of cobalt metal into the United States have almost ceased. Smelting and refining operations in England were also reported to have been expanded, and a new plant for the production of cobalt oxide from local ores was said to have been started in Italy. (*See* also METALLURGY.) (G. A. RO.)

Cochin-China: *see* FRENCH COLONIAL EMPIRE.

Cocoa (CACAO). Growers of cocoa in the western hemisphere had the unusual experience in 1941 of having one of the very few tropical food crops that in some measure profited from the war. Although a large part of the European market was cut off, competition in the New York market from African cocoa beans was greatly curtailed by shortage of ocean shipping. Prices paid growers in the Dominican Republic in 1941 were more than double those of 1940. The Dominican crop was estimated at 2,000,000 bags of 60 kg. each. Exports for the first nine months were 15,599,063 kg. in 1941 and 20,362,069 kg. in 1940. In Nigeria, Africa, the heavy crop was 90,188 tons and the light crop 6,400 tons in 1941, compared to a heavy crop of 98,510 tons and a light crop of 5,629 tons in 1940. The latter light crop was destroyed as an unusable surplus. None of the 1941 crop was destroyed. Ecuador reported the 1941 crop as the largest in several years. Up to Sept. 30, cocoa receipts at Guayaquil were 246,186 quintals of 101·4 lb. each, compared to 162,524 in the same period in 1940, although Peruvian troops occupied a large part of the cocoa-producing area. The 1941 crop of Bahia, Brazil, was estimated at 2,000,000 bags of 60 kg. each. Up to Sept. 30, shipments to the United States were 240,900 bags in 1941 and 183,000 bags in 1940. The 1941 crop in Venezuela, estimated at about 12,000,000 kg., was practically all shipped to the U.S. The 1940 crop in Venezuela was 15,246,304 kg. In the British West Indies, exports to Nov. 1 were 60,290 cwt. of 112 lb.

each, compared to 51,509 in the same period of 1940, while exports from Trinidad and Tobago were 18,627,163 lb. compared to 23,515,626 lb. in the ten months of 1940. (S. O. R.)

Coco-Nuts. More than half the United States imports of fats and vegetable oils (about 1,600,000,000 lb. in 1941) ordinarily comes from Pacific ocean countries. A large part consists of coco-nut oil, copra, copra meal and oil seeds mostly from the Philippines. Outbreak of war with Japan in Dec. 1941 cut off these Pacific sources from the United States. Coco-nut, edible, in drums and less than car lots, was quoted at 15.2 cents in New York city in Dec. 1941, as compared to 7.5 cents in Dec. 1940. Crude coco-nut oil, in tanks, f.o.b. Pacific coast, also increased proportionately, while copra which sold at $22.20 per ton in Los Angeles in Dec. 1940, rose to $42.50 per ton in Dec. 1941, following the outbreak of war. Copra meal, f.o.b. Pacific coast in 100-lb. bags, was $1.42 in Dec. 1940, and $5.12 in Dec. 1941. United States consumption of coco-nut oil increased sharply in 1941, partly because of the need for greater supplies of fats and oils in defense activities, but also because new federal regulations of 1941 (the McNutt standard) encouraged the manufacture of oleomargarine. (*See* BUTTER.) In Nov. 1940, 1,664,000 lb. of coco-nut oil were used in the United States to manufacture oleomargarine. By Dec. 1941 monthly consumption in the manufacture of oleomargarine in the United States was 4,198,000 lb. U.S. imports of coco-nut oil in 1941 (preliminary estimate) were 298,500,000 lb., compared to 259,900,000 lb. in 1940 (crude oil plus refined oil converted to crude basis). The bulk of the imported coco-nut oil is used in the manufacture of soap, oleomargarine and cooking fats. Coco-nut oil was included in the price ceilings on 1,800 oils and fats established by the OPM. (*See* VEGETABLE OILS AND ANIMAL FATS.) (S. O. R.)

Coffee. Western hemisphere trade in coffee in 1941 entered a new and unique era, that of co-operative quota exports by all 14 American coffee-producing countries and quota imports by the United States, the largest coffee-consuming country, from each producing country. This arrangement was described in *Foreign Commercial Weekly*, Nov. 15, 1941, of the U.S. department of commerce as "an act of inter-American co-ordination which for its inauguration required 129 years of experience and oratory." The inter-American agreement averted a "coffee war," restored a substantial measure of stability to the coffee market, which had been badly disrupted by war, and prevented severe if not ruinous effects on the economy of smaller producing countries which could not otherwise compete with Brazil. Brazil, according to the department of commerce, can produce in 12 months all the coffee normally consumed by the whole world in 14 months. As a further effect of the inter-American coffee agreement, prices of coffee in the United States almost doubled in some grades and more than doubled in other grades between Sept. 1940 and Sept. 1941. For example, a popular brand of coffee that retailed at 3 lb. for 39 cents in 1940 sold at 3 lb. for 53 cents in 1941. In addition to its agreement to take some 15,500,000 bags of coffee annually from the 14 American countries, the United States reserved a quota of 355,000 bags annually from other countries. In contrast with this re-establishing of an orderly and equitable market for a commodity of international trade, the U.S. department of commerce pointed to the action of Germany in 1939 when that country bartered for surplus Brazilian coffee and then, before shipping merchandise to Brazil, dumped the coffee on world markets at prices so cheap that other Brazilian coffee could not be moved.

The Inter-American Coffee board, which operates the coffee agreement, made changes in the basic quotas in May and Aug. 1941 to equalize shipments. On Oct. 23, 1941, it authorized shipments up to 15% excess of quotas, to be charged against 1942 quotas for release for consumption after Oct. 1, 1942. Since all countries subscribing to the coffee agreement produce substantially more than their export quotas and since the quotas determine specifically the quantity that may enter international trade, reports of annual production have little importance. The basic annual quotas, which determine quotas of exports, were adopted in Washington Nov. 28, 1940, by the inter-American coffee agreement and are as shown in the table, in 132-lb. bags.

Basic Annual Export Quotas of Inter-American Coffee Agreement

	Exports to the United States	Exports to other countries
Brazil	9,300,000 (bags)	7,813,000 (bags)
Colombia	3,150,000	1,079,000
El Salvador	600,000	527,000
Guatemala	535,000	312,000
Mexico	475,000	239,000
Venezuela	420,000	606,000
Haiti	275,000	327,000
Costa Rica	200,000	242,000
Nicaragua	195,000	114,000
Ecuador	150,000	89,000
Dominican Republic	120,000	138,000
Cuba	80,000	62,000
Peru	25,000	43,000
Honduras	20,000	21,000

Coffee consumption increased sharply in the United States in 1941 because of the expansion of armed forces. Consumption per soldier is about 60% more than the annual per capita consumption. Coffee was rationed in amounts varying from 1 oz. to 3½ oz. per week per person in Denmark, the Netherlands, Germany, Belgium and occupied France. This included substitutes as well as coffee. Before the war Germany was the world's second largest consumer of coffee. In Italy coffee was restricted to use by hospitals and the armed forces. While figures on world production are generally fragmentary, reports from the dominant producing country, Brazil, indicate a small 1941 crop, estimated at 12,787,400 bags, because of unfavourable weather. This together with the carry-over would give Brazil, it was estimated, 18,786,400 bags available for export up to March 31, 1942. The new caffelite plant in Brazil, to produce plastics from coffee, was scheduled to begin operations in 1941, and was designed to utilize 5,000,000 bags of surplus coffee. If the test proved successful the plant would be enlarged. American Airlines in Oct. 1941 adopted a custom of christening new planes with coffee. India, which is endeavouring to popularize coffee in the tea-drinking United Kingdom, reported the 1941 crop as one of the shortest on record: 238,418 bags of 60 kg. The Netherlands Indies crop was estimated at 1,250,000 bags. (*See* also BRAZIL; GUATEMALA.) (S. O. R.)

Coinage. The bureau of the mint is an adjunct of the treasury department. It consists of eight field institutions in widely scattered localities and the administrative office in Washington. The eight institutions are all administered by the director of the mint. There were in 1941 three coinage mints: in Philadelphia, Pa., Denver, Colo., and San Francisco, Calif.; assay offices in New York, N.Y., Seattle, Wash., and New Orleans, La.; a bullion depository for storage of gold at Fort Knox, Ky., and a bullion depository for storage of silver at West Point, N.Y.

Coinage manufactured by the United States mints for the United States during the calendar year 1941 was the largest in the history of the mint, amounting to 1,827,486,276 pieces, valued at $102,209,510.45.

Half dollars	43,553,812 pieces
Quarter dollars	111,842,087 pieces
Dimes	263,830,557 pieces
Nickels	300,160,720 pieces
Cents	1,108,099,100 pieces

All mint records for monthly coinage in the United States

were broken in Dec. 1941, when 247,152,492 pieces were struck, the largest production in any one month since the founding of the mint in 1792.

Coinage for foreign governments amounted to 208,603,500 pieces. The U.S. mints in 1941 executed coins for Curaçao, Dominican Republic, Indo-China, Liberia, Netherlands East Indies and Surinam.

Gold and Silver Acquisitions.—Net gold acquisitions by the mints and assay offices of the United States during the calendar year 1941 amounted to approximately $741,781,000. Net silver acquisitions by the mints and assay offices of the United States during the calendar year 1941 amounted to approximately 90,874,000 fine ounces. (N. T. R.)

Coke. The 1940 coke production of the United States rose 29% over that of 1939, with 54,014,300 short tons of by-product coke and 3,057,800 tons of beehive coke, a total of 57,072,100 tons, to which there might also be added 4,165,450 tons of coke breeze or screenings. The years output required the use of 81,385,000 tons of bituminous coal, or 18% of the output for the year. There was a large increase in the number of ovens during the year, which was necessary to take care of the increased output; the number increased from 23,666 to 27,884, and 1,842 additional ovens were under construction at the end of the year. The total number of ovens built or building during the year was 6,770, while the number dismantled was only 710. The largest consumer of coke is the iron blast furnace, which took 75% of the output, or 42,484,000 tons; domestic use took 14%, gas production 5% and foundries 4%.

Both exports and imports of coke are small.

Production during the first ten months of 1941 reached 53,563,673 tons, a 15% increase over the same period in 1940. The total for the year might be expected to be as much as 64,000,000 tons, and might even be more, as compared with the former record high of 56,478,000 tons, made in 1918.

Normally the United States is the world's foremost producer of coke, followed by Germany, Great Britain, U.S.S.R., France and Belgium, but no information was available on production outside of the United States. (G. A. Ro.)

Cold, Common. The common cold is established as an epidemic virus infection of the upper respiratory tract frequently confused with other conditions, limited to four or five days' duration and of itself comparatively inconsequential. It prepares the way for secondary infection. Employed workers lose an average of one day a year from this cause, or a total loss of 45,000,000 days of work a year. The monetary loss may be close to $1,000,000,000.

Numerous attempts at prevention have been made: Walsh used an intranasal vaccine spray in nearly 400 patients over a period of eight years and reported good results in about three-quarters, failures in 16% and fair results in the rest; antiseptic snuffs have been tried in Britain in connection with shelter life, but the results, so far as the prevention of colds is concerned, have so far been inconclusive; large doses of vitamins were tested by Kuttner for their effect on the incidence of colds and upper respiratory infections in rheumatic children, but no evidence was obtained to suggest that this reduces the incidence of these infections; irradiation of the air in a children's ward in a hospital was tried for its effect on reducing the incidence of respiratory infections, and it was concluded that this method holds promise. Additional reports on the attempted prevention of colds by the use of oral vaccines appeared, but the results seemed highly questionable.

Few types of treatment were reported: Studies based on three and a half years' work have not demonstrated any value in the linseed oil concentrate treatment of the common cold; a controlled study on the possibilities of aborting colds with either benzedrine inhaler or a codeine-papaverine mixture gave encouraging but not conclusive results. (E. P. J.)

Colleges and Universities: *see* UNIVERSITIES AND COLLEGES.

Colombia. A republic in northern South America bordering both the Caribbean and the Pacific. Area, 448,794 sq.mi. The population (1938 census: 8,724,839) was officially estimated at 9,334,392 in 1941. Capital is Bogotá (331,400). Other leading cities are Medellín (170,622), Barranquilla (152,348), Cali (110,579), Cartagena (86,197), Manizales (83,346), Ibague (61,860), Cucuta (57,251), Bucaramanga (49,891), Pasto (49,533), Neiva (34,699), Santa Marta (33,163), Popayán (24,479), Tunja (20,417). The population is very largely concentrated on the eastern Andean plateau, the interior departments of Antioquia and Caldas and the upper Cauca valley. Religion: Roman Catholic. President in 1941: Dr. Eduardo Santos.

History.—Colombian history in 1941 was marked externally by efforts to maintain a relative neutrality in World War II, with, however, frank support of the policy of American solidarity; and internally by political conflicts preliminary to the presidential elections of 1942. Although drawn steadily toward the world conflict in 1941, Colombia sought to maintain its strictly neutral position. Pres. Santos himself formally declared hemisphere solidarity to be the keystone of Colombian foreign policy.

Throughout the year evidence of nazi propaganda and other activity continued to pile up. Three Germans were jailed in January for suspected espionage. Further arrests followed disclosure, in August, of a well organized axis plot to infiltrate the army with propaganda. Resentment was felt by some Colombians at Pres. Roosevelt's disclosure, in September, of the existence of secret nazi air bases on Colombian soil within striking distance of the Panama canal. Government investigation, however, verified the charges.

Some indignation was felt, too, upon publication of the United States anti-axis blacklists in July. A senate investigation, however, showed only 10% of the affected firms in the country to be Colombian-owned, and a third of these were deleted from the list. On the other hand, relations with the United States were brought closer through a $12,000,000 United States Export-Import bank loan to be used for the construction of hydroelectric plants, roads and irrigation development.

Upon the Japanese attack on the United States in December, Colombia promptly severed diplomatic relations with Japan, and later with Germany and Italy, and declared its intention to regard the United States and other American nations as still possessing the rights of nonbelligerents.

Internally, the country was torn by political turmoil, with both Liberals and Conservatives split. The March congressional elections continued Liberal control of congress, but left the Liberals sharply divided between supporters of moderate Pres. Santos and relatively radical former Pres. Alfonso López, who loomed as the probable official Liberal candidate in the 1942 presidential elections. López' political strength derived from the New Deal legislation and policies of his administration

(1934–38); his attitude toward international developments was essentially "non-interventionist," although his public utterances were marked by equivocal pro-United States declarations. In August the Liberal party presidential nomination convention was controlled by the Lopistas, but López was unable to obtain the two-thirds vote necessary for nomination, and deadlock resulted. The convention did, however, give its endorsement to Pres. Santos' foreign and domestic policies. Eventually (Sept. 4), the Lopistas formally proclaimed López as the Liberal nominee, but a dissident anti-López group seceded and nominated its own candidate. The Conservative party, in the minority since 1930, declined to nominate a candidate of its own and gave support to the anti-López Liberals. Embittered by the López candidacy, 13 anti-López Liberal senators and the entire Conservative membership of the senate resigned in protest. The breach was further evidenced by a Conservative–anti-López Liberal fusion to control the lower house of congress. Amid this setting, faction-torn Colombia prepared for the presidential campaign itself. In view of Colombia's record of nearly 40 years without revolution—longer than any other country of Latin America—it was generally conceded that the election results would be accepted.

Education.—In 1939 there were 8,959 primary schools (enrolment 606,250), mostly public, 450 secondary (enrolment 34,599), including 75 public and 34 normal (enrolment 3,699). All schools, including specialized, numbered 10,312 (enrolment 700,677). The National university, at Bogotá, and the University of Medellín are the most important universities.

Finance.—The monetary unit is the peso (value: 57 cents U.S. in 1941). On May 31, 1941, the national debt was 236,811,300 pesos (internal 100,592,419 pesos). In May 1941 definitive adjustment was made on $50,000,000 of partially defaulted external dollar bonds.

Trade.—In 1940 imports (mainly textiles and other manufactures) were valued at 148,192,000 pesos (a 19.2% decline), the United States supplying 74.4% (1939: 54%) and Great Britain 8.4% (9.5%). Exports were 166,386,000 pesos (a 6% decline), largely to the United States, 69.8% (1939: 66.9%), Canada 11.3% (7.1%), Curaçao 7.8% (8.1%), France 3.1% (3.1%), Great Britain 1.9% (1.4%). Germany's share of 1940 exports and imports was 0.6% each, against 7.3% and 12.8%, respectively, in 1939. The chief export commodities are: coffee, 44.5% in 1940 (1939: 49.2%), gold, 25.1% (22.9%), petroleum, 24% (18.1%), bananas, 3.4% (4.9%). Coffee and gold go almost entirely to the United States, petroleum chiefly to Canada (1940: 38.4%).

Communication.—Maritime communication is mainly through Cartagena and Barranquilla, which handle more than half the foreign trade, with Santa Marta and the Pacific ports of Buenaventura and Tumaco also important. External air service is by Pan American Airways. Owing to inadequate land communications, air transport effects greater time saving from Bogotá to the main currents of world trade than from any other world capital. The important state-owned internal air lines are well developed. In 1941 the Magdalena river, 3,282 km. of railway and a 10,000-km. highway system (supplemented by departmental roads) provided internal communication, but were not well integrated.

Agriculture. Agriculture, supporting 70% of the population, is the basic industry. Colombia ranks second to Brazil in coffee production and leads in "mild type" coffees. Export in 1941 was under the Inter-American Coffee Quota, with a 1941–42 allotment of 3,494,774 bags for export to the United States. Coffee's importance in Colombian economy arises not merely from the volume of output, but also from the fact that the industry, unlike banana and mineral production, is Colombian-owned. To peg 1942 prices, 16,000,000 pesos (a fifth of the budget) was allocated for purchase of excess production. Bananas, second agricultural export, declined in 1940. The United States and Great Britain took most of the crop, but British import restrictions deprived Colombia of that market in 1941.

Manufacturing.—In 1939, 1,378 manufacturing plants represented a 108,864,000-peso investment, with textiles, beer, sugar, cement and cigars and cigarettes the leading manufactured products.

Mineral Production.—Colombia in 1941 ranked ninth in world petroleum production (1941: 24,400,000 bbl. est.; 1940: 26,864,000 bbl.; 1939: 23,857,000 bbl.). The chief metals are gold (1940: 631,927 oz.) and platinum (23,671 oz.). (L. W. BE.; J. S. CU.)

Colorado, a Rocky mountain state of the United States, in the west-central part; mean elevation above sea level, 6,800 ft. Admitted to the union in 1876 as the 38th state and known as the "Centennial state." Area, 103,967 sq.mi. Population (1940), 1,123,296; 52.6% urban, 47.4% rural. Capital and largest city, Denver, 322,412. Other cities in order: Pueblo, 52,162; Colorado Springs, 36,789; Greeley, 15,995; Trinidad, Boulder, Grand Junction and Fort Collins, 12,000 to 15,000.

History.—Governor, Ralph L. Carr (R.); lieutenant governor, John C. Vivian (R.); secretary of state, Walter F. Morrison (R.); auditor, Charles M. Armstrong (R.); treasurer, Homer F. Bedford (D.); attorney general, Gail L. Ireland (R.); superintendent of public instruction, Mrs. Inez Johnson Lewis (D.). In 1940 the state cast 278,855 votes for Willkie, 265,364 for Roosevelt. The state property tax was reduced from 4.35 mills to 4.25 in 1941. Robert F. Rockwell, Republican, was elected to succeed Edward T. Taylor, deceased, as congressman from the Fourth Colorado district. United States Senator Alva B. Adams, Democrat, died, and Governor Carr appointed Eugene D. Millikin, Republican, to serve until the next general election. In 1939 Colorado had four Democratic representatives and two Democratic senators. In 1941 it had one Democratic representative and one Democratic senator.

Chief Justice Francis E. Bouck of the Colorado supreme court, Democrat, died, and the governor appointed William S. Jackson, Republican, to serve until the next general election.

Education.—There were 171,508 elementary pupils in 1941 enrolled in 2,365 schools, with 5,722 teachers, and 55,564 pupils enrolled in 491 secondary schools, with 3,447 teachers. Eight state educational institutions had a total enrolment of 9,136, and teaching staffs of 781; total annual disbursements, $3,744,000. State university enrolment, 4,053; teaching staff, 312; three teachers' colleges had a total enrolment of 2,050 and teaching staffs of 233.

Public Welfare, Charities, Corrections.—Public welfare disbursements, including $9,115,000 federal grants, $21,410,000. Pensions: 42,434 persons over 60, $15,926,000; dependent children, 15,008, $1,581,000; blind, 602, $163,000; direct relief, 14,163, $1,927,000; child welfare, 848, $37,000; tuberculosis, 133, $52,000. Unemployment insurance: 136,734 insured in 1940; 395,398 checks totalling $4,176,000 in benefits. Four correctional institutions, with 2,124 inmates; annual disbursements, $961,840. Eight charitable institutions, with 5,446 inmates; annual disbursements, $2,136,000.

Communications.—State highway system, including 3,976 mi. federal aid, totals 12,202 mi.; county roads, 65,130 mi. Thirty railroads had 4,870 mi. of main line track. There were 31 airports and landing fields, and 1,300 licensed pilots, including federal air school. Number of telephones, 233,669.

Banking and Finance.—There were 78 national and 66 state banks; total deposits, $343,280,816; assets, $379,735,799; 55 savings, building and loan associations, with assets of $35,114,832. Biennial state budget, $120,967,319. Outstanding state bonds, $2,539,000 net; highway anticipation warrants, $21,185,000 net.

Agriculture.—Farm crops harvested from 5,559,000 ac. in 1940 were valued at $72,784,000, compared with 5,045,000 ac. and $69,890,000 in 1939. Total 1940 farm income, including $10,112,000 government payments, $141,904,000. Climatic conditions generally were favourable in 1940, with above-average precipitation and irrigation water supplies.

Table I.—*Leading Agricultural Products of Colorado, 1940 and 1939*

Crop	Unit	1940	1939
Wheat	bu.	13,560,000	12,965,000
Corn	"	10,656,000	8,043,000
Barley	"	9,368,000	7,056,000
Oats	"	4,530,000	4,205,000
Dry beans	ton	88,000	71,000
Sugar beets	"	2,034,000	1,543,000
Hay	"	1,050,000	1,817,000
Potatoes	bu.	15,210,000	14,400,000
Grain sorghums	"	5,000,000	2,363,000

Manufacturing.—Total value of products manufactured in 1939 was $221,642,666, compared with $237,838,370 in 1937. Persons employed, 27,893 in 1939; 31,129 in 1937. Wages and salaries, $37,509,961 in 1939; $42,052,535 in 1937.

Table II.—*Principal Industries of Colorado, 1939 and 1937*

INDUSTRY	Value of Products	
	1939	1937
Meat packing	$33,005,533	$39,805,939
Bakery products	8,422,889	11,844,068
Butter	6,627,153	8,394,917
Newspaper and publishing	9,567,285	9,471,535
Flour, etc.	6,916,494	10,229,567

Mineral Production.—Production of all minerals in 1939 was valued at $64,071,621; 1938, $60,369,440. Production of all minerals remained fairly consistent in comparison with recent years.

Table III.—*Principal Mineral Products of Colorado, 1939 and 1938*

Mineral	Value, 1939	Value, 1938
Gold	$12,839,820	$12,861,380

Columbia University. An institution of higher learning in New York city. In 1940–41 the university had a registration of 30,197 resident students, including 10,568 students in the summer session of 1940; there were 9,150 students in the summer session of 1941. The total number of officers of administration and instruction was 3,289. The number of buildings on the campus at Morningside Heights was 70. In 1941 the university capital endowment was $89,050,717.20 and the total resources were $157,063,975.49. The budget appropriation for 1940–41 was $14,866,981.47. The library numbered 1,763,855 volumes. A ten-day conference of the International Labour organization (*q.v.*), a division of the League of Nations, was held at Columbia in the fall of 1941. At the end of 1941 the university was engaged in a revision of its schedules and curriculum in various schools to enable students to complete their courses in a shorter time. (M. H. T.)

Columbium. The production of columbite in Nigeria was 396 long tons in 1940, of which 250 tons was exported to the United States. Mining was discontinued during the year, and shipments were made from stocks amounting to 5,378 tons as of Sept. 30, 1940. Reserves of unmined columbite were estimated at 20,000 tons. Imports of columbium ores into the United States in 1940 were 595,220 lb., mostly from Nigeria. (G. A. Ro.)

Commodity Credit Corporation. Commodity Credit corporation was created as an agency of the United States government pursuant to the provisions of the National Industrial Recovery act, under the president's executive order 6340, Oct. 16, 1933, under the laws of the state of Delaware. Under the president's reorganization order, effective July 1, 1939, the corporation functions as a part of the U.S. department of agriculture. The corporation is authorized to issue and have outstanding at any one time bonds, notes, debentures and other similar obligations not to exceed $2,650,000,000. These obligations are fully and unconditionally guaranteed by the United States. The corporation has been continued as an agency of the United States until June 30, 1943, or such earlier date as may be determined by the president.

Primarily a lending institution, Commodity Credit corporation utilizes its funds to support farm prices and enable the orderly marketing of agricultural commodities. Non-recourse loans to producers have been made on the following commodities: cotton, corn, wheat, tobacco, turpentine and rosin, rice, butter, dates, figs, hops, mohair, peanuts, pecans, prunes, raisins, rye, grain sorghum and wool. While loans are made principally to individual producers, co-operative marketing associations may also secure commodity loans under certain programs to facilitate marketing. All loans are made on the security of warehouse receipts for the collateral, with the exception of loans made on grain stored on the farm, in which case chattel mortgages are accepted to secure the collateral. Although loans may be made directly through the Commodity Credit corporation, more than 90% are made through banks and other approved lending agencies, and all notes bear interest at the rate of 3% per annum, of which 1½% is collected by the lending agency for the period of its investment.

Table I.—*Loans by Commodity Credit Corporation, Oct. 31, 1941*

Commodity	Commodity loans held by CCC	Commodity loans held by banks	Total commodity loans outstanding	Total quantities of commodities held as collateral
Barley	$ 336,000	$ 5,471,000	$ 5,807,000	14,903,000 bu.
Corn	105,493,000	36,173,000	141,666,000	215,669,000 bu.
Cotton	17,611,000	5,996,000	23,607,000	323,000 bales
Flaxseed	21,000	585,000	606,000	361,000 bu.
Grain sorghums	..	1,000	1,000	3,000 bu.
Prunes	3,942,000	..	3,942,000	78,000 tons
Rye	465,000	733,000	1,198,000	2,595,000 bu.
Tobacco	13,500,000	..	13,500,000	90,421,000 lb.
Turpentine and rosin	10,869,000	..	10,869,000	940,000 bbl. rosin 596,000 gal. turp.
Wheat	22,171,000	274,103,000	296,274,000	301,165,000 bu.
Total commodity loans	$174,408,000	$323,062,000	$497,470,000	

Loan rates on 1941 crops of cotton, corn, wheat, rice and tobacco were made at 85% of parity, as directed by Public Law 74, enacted May 26, 1941. (Parity, generally speaking, is defined as the price of the commodity that would give the farmer a purchasing power equivalent to the purchasing power of the same commodity unit in a base period, usually the 5-yr. period 1910–14.) In addition, the corporation approved programs for the purchase of certain commodities. An option to repurchase is usually granted for a limited period. Commodities purchased under these arrangements include tobacco, rice, dairy products, seed for conservation projects and certain general foodstuffs.

Reserves of food, feed and fibre stored in times of abundance under commodity programs were available for distribution in 1941. Lend-lease requirements for cotton, corn, tobacco, wheat and naval stores were supplied from stocks accumulated through loans and purchases, and corn reserves accumulated in years of surplus harvest provided additional food supplies required for the planned expansion of pork, dairy and poultry products in the United States. Stocks of all major commodities, acquired under previous programs, were reduced during 1941. In addition to sales by CCC, substantial quantities of commodities, particularly cotton and wheat, pledged for loans in 1940, were redeemed in 1941 and sold by producers.

Commodity credit loans and purchases during the fiscal year ending June 30, 1941, were the largest in any one year since the inception of the organization, and amounted to approximately $513,000,000, an increase of $117,000,000 over the previous year.

Table II.—*Commodities Owned by Commodity Credit Corporation, Oct. 31, 1941*

Commodity	Quantity	Book value
Barley	57,000 bu.	$ 28,000
Corn	161,329,000 bu.	118,801,000
Cotton, 1934–35	1,321,000 bales	94,374,000
Cotton, 1937–38	4,699,000 bales	230,433,000
Rubber	91,000 tons*	34,498,000
Rye	1,034,000 bu.	648,000
Tobacco	304,139,000 lb.	79,229,000
Wheat	173,010,000 bu.	163,306,000
Dairy products	..	1,444,000
Other commodities	..	106,927,000
		$829,688,000

*This rubber was acquired in the barter of cotton for rubber initiated in 1939 with the United Kingdom and is held as a defense reserve.

Commonwealth Fund, The. This endowment, established in 1918 by Mrs. Stephen V. Harkness "to do something for the welfare of mankind," and later increased by gifts from the founder and from Edward S. Harkness, president of the fund from its inception until his death on Jan. 29, 1940, amounted in 1941 to approximately $49,000,000. In the year ending Sept. 30, 1941 the fund appropriated some $1,800,000. Of this total more than half was devoted to the promotion and maintenance of physical health. Sums amounting to $550,000 were set aside for philanthropic needs arising out of the war.

Public health activities, designed to raise standards of rural service, centred in Tennessee, Mississippi, Oklahoma and Alabama. The 13th in a group of rural community hospitals built or remodelled with aid from the fund was completed in 1941; one more was under way. Some $366,000 was given for medical research. The Commonwealth fund fellowships for British graduate students at American universities were suspended, but grants were made to assist the research of several British scientists in the United States. The fund continued to aid child guidance enterprises in England; maintained an advisory service for community mental hygiene clinics in the United States; supported studies in administrative law and legal history and published during the year eight books and pamphlets of educational significance in its fields of operation. The directors of the fund were in 1941 Malcolm P. Aldrich, president; Phil W. Bunnell, Samuel

H. Fisher, George Welwood Murray, Dean Sage and William E. Stevenson. (B. C. S.)

Communications Commission, Federal: *see* FEDERAL COMMUNICATIONS COMMISSION.

Communism, or revolutionary Marxism, is a system of government evolved under the leadership of Lenin and Stalin in the soviet union. Communism believes in the dictatorship of the proletariat for a transitional period, after which a free society would come into existence in which everybody would contribute to the common weal according to his capacities, and receive a reward according to his need. This ultimate goal seemed in 1941 still very far away in the soviet union; meanwhile the soviet union represented a dictatorship of the Communist party with state ownership of all the important means of production. Communism proclaims the equality of all peoples and races and believes in the final establishment of a peaceful international order. Within this general frame communist policy has undergone several fundamental and sometimes sudden changes since 1920. One occurred in Aug. 1939, when the soviet union, and with it all the communist parties throughout the world, abandoned the principle of collaboration with the democratic nations in the struggle against fascism, and lined up side by side with aggressive fascism which communists had proclaimed until then the mortal enemy of the proletariat, of peace and of progress. Since then, and during 1940, the Communist party everywhere played a rather enigmatic and ambiguous role; nevertheless it directed all its main attacks against democracy, against Great Britain's effort to resist fascist aggression, and against the defense program of other democracies, including the United States, to prepare themselves against similar fascist aggression.

This development could be explained by the fact which had been visible already in the preceding years, that communism had abandoned more and more its original emphasis on internationalism, and that with Stalin and his generation the emphasis had shifted to the "socialist fatherland," even to the degree that Russian nationalism was revived and the Russian past rehabilitated against the original interpretation of Marxist critics. During the first part of 1941 communism continued to pursue a policy of neutrality and isolationism. For the first part of 1941 the line of 1940 was not changed. On Feb. 15 the Communist party of the soviet union assembled in Moscow for its 18th conference, having not met for two years, and stressed there the need of a greater efficiency of the party bureaucracy in all fields of Russian economic and military endeavour. Probably it was in the same spirit that externally a profound change was made in the position of the leader of communism, Joseph Stalin (*q.v.*), who so far had been only the secretary-general of the Communist party in the soviet union, and who became now, while retaining his former post, for the first time an official of the soviet government, namely chairman of the Council of People's Commissars, while the former chairman, V. M. Molotov, became vice-premier. As in 1940, little authentic news came out of the soviet union. A strict censorship was maintained, the activities of foreign correspondents were severely curtailed, and visits to the soviet union from abroad practically ceased. Nevertheless, it was the general conviction, that Stalin carried out his obligations under the pact of friendship with national socialist Germany as faithfully as did the Communist parties in Great Britain and the United States. The latter tried to impede all national defense efforts and agitated violently in America against help to Great Britain and against any United States participation in a war which they then regarded as being of no concern to mankind or to the United States.

This attitude was completely changed by the events of June 22, 1941 when the German armies, without the slightest warning or declaration of war, suddenly attacked the soviet union and crossed its borders. The shift in the communist policy, both in the soviet union and abroad, was as sudden and complete as it had been in Aug. 1939. From that moment on, the soviet union waged a bitter war against fascist aggression, and the Communist parties everywhere supported faithfully the war. The communists in the United States abandoned isolationism, recognized the war as a conflict which threatened the liberty and dignity of men everywhere, and demanded full help not only for the soviet union but for all nations resisting fascist aggression. Stalin in his speech of July 3, 1941, after a rather futile and unconvincing effort to defend the policy of isolationism and neutrality, came out with a patriotic appeal to defend the territory of the soviet union against aggression and proclaimed that "our war for the freedom of our country will merge with the struggle of the peoples of Europe and America for their independence, for democratic liberties." The national socialist government tried to proclaim its war for the conquest of eastern European territory, an often expressed wish of German expansionists, as a crusade on behalf of European civilization and of Christianity against godless and barbaric communism. Hitler's expectation of finding a ready echo for this interpretation of his attack against the soviet union, after two years of studied silence about the dangers of communism and of emphasized friendliness toward the soviet union, was not borne out. The governments and the large majority of the democratic nations, though maintaining their uncompromising antagonism to communism, regarded the military forces and the people of the soviet union as united with them in a common effort to defend all peoples against subjugation by Germany and Japan and inclusion into the national socialist world order. Fascist forces might have hoped that the Roman Catholic church which had often emphasized its hostility toward communism would support Chancellor Hitler as a Christian crusader, but the solemn allocution of Pope Pius XII on June 29 dispelled these hopes. When on Nov. 25, the fifth anniversary of the signing of the first anti-comintern pact between Germany and Japan, Chancellor Hitler convoked all governments under his and Japanese influence to Berlin to sign a new anti-comintern pact, none even of the few remaining independent nations of Europe appeared. Meanwhile the German armies, supported by satellite forces of Italy, Hungary, Rumania, Slovakia and Finland, had made great progress in the war, occupied large and important parts of the soviet union and destroyed many resources and industries which had supplied the soviet armies. Nevertheless, not only did the Russian armies show an unexpected force of resistance and courage, and thus were the first army met by the Germans on land with a similar determination to fight as that possessed by the Germans themselves, but the soviet government showed, in spite of defeats and retreat, a rare power of cohesion and of survival.

On the 24th anniversary of the communist revolution in Russia, on Nov. 6, 1941, Stalin delivered an address to the people of the soviet union in which he appealed to the "great Russian nation, the nation of . . . Pushkin, Tolstoy, Glinka and Tschaikovsky. . . . as distinct from Hitlerite Germany, the soviet union and its allies are waging a war of liberation—a just war calculated for the liberation of the enslaved peoples of Europe and of the soviet union from Hitler's tyranny." This speech by Stalin may be regarded as the keynote of communist policy, in the soviet union and abroad, in the second half of 1941.

Communist parties in countries under fascist influence were outlawed. In democratic countries their activities were allowed, but the British government suspended the publication of the two communist main organs, the *Daily Worker* and the *Week*, a mimeographed news letter, on Jan. 21, 1941, because, as the government

declared, they had systematically published matter "calculated to foment opposition to the prosecution of the war to a successful issue." In none of the democratic countries was communist influence or membership on the increase. Though after June 22, 1941 the Communist parties sought to co-operate with the democratic governments in the defense against fascist aggression, their co-operation was accepted only with reservations and without in the slightest degree implying that any compromise with communist ideology or tactics would be made. In China, where the Communist party had co-operated with Chiang Kai-shek's government against Japanese aggression, the relations between the government and the Chinese communists became more and more strained during 1941. Communist Party: *see* COMMUNISM.

Community Chest, a term which describes a local co-operative organization of U.S. citizens and social welfare agencies. Also known in some localities as "welfare federation," "community fund," "united fund" etc., the community chest has two general functions: (1) to raise funds each year by a community-wide appeal for all its affiliated, voluntary social and health agencies and to distribute those funds according to need by a budget procedure; and (2) to promote the social welfare and health of the community by co-ordinating services, improving standards, studying local problems and developing better public understanding. Closely allied with the community chest, more in social planning than in the fund-raising operation, is the council of social agencies.

In support of private social and health work for 1941, community chests raised $90,587,589 in 598 campaigns, which is an increase of $4,290,521 more than the 1940 totals. The general trend in community chest giving has been upward since 1935. The average per capita raised for 1941 by 118 chests which were included in a special study was $1.83. Approximately 20 out of every 100 persons in these 118 cities subscribed to the community chest in 1941, 41% more than in 1929 and an increase of 9.6% over 1940.

A special activity in which chest-supported voluntary social agencies and councils of social agencies were widely involved during 1941 arose from co-operation with selective service boards, in helping to investigate deferment claims, in following up cases of need for health or other service revealed by conscription investigations, etc. Councils of social agencies in many communities, through their member agencies, organized facilities to give information, entertainment, health, housing and other services to men in the armed forces.

In 1941 there were 598 community chests in existence, 575 of them in continental United States, one in the Virgin islands, two in Hawaii, 18 in Canada and two in South Africa. Almost every city in the United States with more than 100,000 population had a community chest or similar plan of federated financing for its voluntary social services.

Community Chests and Councils, Inc., 155 East 44th st., New York city, the national organization of community chests and councils of social agencies, was organized in 1918 as a clearing house for information for the 21 chests then organized. In 1941 the number of chests and councils affiliated on a voluntary membership basis was nearing 400. A board of directors and an executive committee composed of laymen and executives of local member chests and councils guides the organization's policies, and dues of member agencies finance the association. Community Chests and Councils, Inc., administers the annual Community Mobilization for Human Needs, sponsored by 36 co-operating national social agencies, and gives nationwide backing to local campaigns for funds for voluntary social work.

Officers for 1941–42 were: Robert Cutler, president; John Stewart Bryan, vice-president; Kenneth Sturges, vice-president; J. Herbert Case, treasurer; Lynn Mowat, secretary. Allen T. Burns was executive vice-president. (*See* also RELIEF.)

(A. T. B.)

Community Trusts. Philanthropic distribution in 1940 by 76 community trusts and foundations in continental United States, Canada and Hawaii totalled $2,225,000, compared with $1,278,000 during 1939. This disbursement was more than 25% in excess of that made in any year since the founding of the first community trust in Cleveland, O., on Jan. 2, 1914.

The aggregate principal funds of these foundations rose from $36,000,000 in 1930 to $40,000,000 in 1934, $50,000,000 in 1939 and $52,500,000 at the close of 1940.

The New York Community trust held the largest amount of principal funds, $9,409,021, followed by the Chicago Community trust with $9,126,048, the Cleveland foundation with $6,745,785, the Permanent Charity fund, Boston, with $5,535,761 and the Winnipeg foundation with $3,422,191. Other community trusts in Indianapolis, Minneapolis, Richmond, Philadelphia, Los Angeles and Buffalo held resources in excess of $1,000,000. (R. Hs.)

Congregational Christian Churches. The Congregational Christian churches in the United States numbered 6,006 in 1941. This showed a loss of 35 congregations. Members numbered 1,058,807, a gain of 9,232 over the total of 1940. This loss in number of congregations with an increase in the total membership illustrated the trend toward fewer but larger churches, which had continued for some years. Many small churches were being merged with neighbouring churches; and this strengthening of the remaining churches stimulated renewed activity and growth.

The churches reported 3,730 young people's societies, a gain of 29, with a total membership of 195,585, a gain of 4,015. A total number of 3,195 churches kept record of church attendance; and these figures show that there had been an increase during 1941 in the average Sunday attendance of the churches keeping records. The list of ministers totalled 8,551, of whom 3,380 were pastors of churches; 125 missionaries; 286 educators and the rest in various kinds of religious and social work. Pastors' salaries showed a slight increase. The average salary of all ministers—and this of course includes the salary of many home missionary pastors as well as pastors of larger churches—was $1,774.

During the year the churches received 434 legacies, the total amount so bequeathed being $1,285,903. To all benevolences the churches gave $2,023,350, an increase of $114,911 over the preceding year.

The Congregational churches are not creedal churches; that is, they do not require assent to a creed for church membership. Church membership is based on a covenant, a simple statement of purpose; and Congregational churches receive as new members those who are willing to accept the covenant of the church and agree to live according to its purposes. This basis of church mem-

bership means that people with various religious backgrounds and with different shades of thought about religious teaching can unite together in Christian fellowship. No member is ever told what he must believe to be a good church member. As long as he shares the common purpose he is accepted as a member of the church.

The Congregational churches in America began with the arrival of the Pilgrims at Plymouth, Mass., in 1620. The name "Congregational" indicates that the congregation is the final authority. Each individual church through the action of its members calls its own minister, plans its own program, regulates its own finances, determines its own policies.

In accordance with the principle of fellowship, the churches maintain simple organizations for fellowship and administration but never for legislation. The churches of a county or a small geographical area are grouped in associations; the churches of a state, into state conferences, each of which has a superintendent and in larger states a considerable staff. The churches of the nation are united in the official national organization—The General Council of the Congregational Christian Churches. This national organization maintains a national office at 287 Fourth ave., New York city. The International Council of Congregational Churches includes churches in the countries shown in the table; the world office is the Memorial hall, Farringdon st., E.C.4, London, England. (F. L. F.)

Congress, United States.

The 77th U. S. Congress met for its second session Jan. 5, 1942. It comprised the following members (as of Jan. 14, 1942):

United States Senate

Presiding Officer: Henry A. Wallace, Vice-President of the United States

Majority Leader: Alben W. Barkley, of Kentucky

Minority Leader: Charles L. McNary, of Oregon

WHEN HE CHARGED that the North American Aviation strike at Inglewood, Calif. was inspired by communists, Richard T. Frankensteen, officer of the C.I.O., was booed off the platform by strikers June 8, 1941. The next day President Roosevelt called out the army to open the plant

Congress of Industrial Organizations.

Noteworthy among advances reported by the Congress of Industrial Organizations in 1941 was the organization of the employees of the Ford Motor company, the "Little Steel" companies (Bethlehem, Republic, Inland and Youngstown) and other big industrial corporations which previously had refused to enter into signed agreements with the CIO unions. The Ford company signed a union shop contract, hailed as one of the best to be won by the CIO, after its employees had voted by an overwhelming majority for the union in labour board elections.

The CIO also reported rapid strides in organizing the aircraft, machine manufacturing, shipbuilding and other defense industries; launched a major campaign in the oil industry, and resolved to make unionization of the south a major aim in 1942.

Notable wage improvements were won by the CIO in the coal industry, where the differential between southern and northern wages was abolished in the Appalachian agreement and the union shop established throughout the industry, in the steel industry and in all other organized industries.

To implement its support of the defense program, the CIO in 1941 promoted the Industry Council plan, drafted by President Philip Murray (*q.v.*), to increase production of armaments and domestic goods through industry councils, in which labour and industry should be equally represented, with a government representative as chairman. It applied the principles of this plan in detailed and practical proposals for industry-wide planning for increased production in the auto, aircraft, steel, aluminum, non-ferrous metals, longshore, farm equipment and other industries.

The CIO held its 1941 convention in Detroit in November, where it took a strong stand in favour of furnishing all possible aid to and co-operation with Great Britain, the soviet union and China in the struggle "to rid the world of Hitlerism, the enemy of mankind."

Immediately war was declared, all sections of the CIO pledged their complete support for the war effort. The CIO also participated in the labour-industry-government conference in Washington in December, at which an agreement was reached to prevent all strikes and lock-outs for the duration of the war and to set up governmental machinery for the peaceful adjustment of industrial disputes.

President Murray, Secretary James B. Carey and the six vice-presidents were re-elected at the Detroit convention.

First established in Nov. 1935 as the Committee for Industrial Organization, the CIO became established on a permanent basis at its first constitutional convention in Nov. 1938, where it adopted its present name. Its headquarters are at 1106 Connecticut ave., Washington, D.C. (*See* also AMERICAN FEDERATION OF LABOR; DEFENSE, NATIONAL [U. S.]; LABOUR UNIONS; STRIKES AND LOCK-OUTS; UNITED STATES.) (P. My.)

Connecticut. The most southwesterly of the New England states, and the fifth of the original states of the union to ratify the federal constitution, Connecticut is popularly known as the "Nutmeg state" and the "Land of Steady Habits"; land area, 4,899 sq.mi.; population (1940), 1,709,242, an increase of 6.4% over 1930. Capital, Hartford (166,267). Other cities

with more than 50,000 population in 1940: New Haven (160,605); Bridgeport (147,121); Waterbury (99,314); New Britain (68,685). Of the state's population in 1940, 1,158,162 were urban, or 67.8%. In 1940 there were 1,675,407 whites; 32,992 Negroes; 1,347,466 native born; 327,941 foreign born.

History.—The principal state officers in 1941 (for the term 1941–43) were: governor, Robert A. Hurley (Democrat); lieutenant governor, Odell Shepard; secretary of state, Mrs. Chase Going Woodhouse. The United States senators were John A. Danaher (term 1939–45), and Francis T. Maloney (term 1941–47). The general assembly of 1941 consisted of 22 Democrats, 13 Republicans in the senate; 88 Democrats, 184 Republicans in the house. The only elections in the state in 1941 were for town, city and other local officers; these showed no significant changes in the voting.

The biennial session of the general assembly initiated constitutional amendments to make sessions annual and to increase the terms of elective state officers to four years with elections in odd-numbered years. The common pleas courts were placed on a state, instead of local, basis and a state system of juvenile courts was created. A state council of defense (Samuel H. Fisher, administrator) was set up, and the state was authorized to purchase land to be leased to the federal government for an army air base at Windsor Locks. Provision was made for entering into an interstate sanitary compact with New York and New Jersey. Any state surplus in excess of $1,000,000 was to be applied to debt extinction. Solvency of the unemployment compensation was assured by a provision that the increased benefits and decreased taxes be conditioned on maintaining a reserve of $40,000,000.

Education and Charities. In 1939 40 the enrolment in 853 elementary schools and kindergartens was 187,482, with 5,807 teachers. In 36 junior high schools, with 617 teachers, there were 23,344 pupils enrolled; in 94 senior high schools, with 2,309 teachers, the enrolment was 79,654. State educational institutions are: the University of Connecticut at Storrs (enrolment in 1941, 1,648); Teachers' College of Connecticut at New Britain (489); state teachers' colleges at New Haven, Willimantic and Danbury; state trades schools in 11 cities (to be increased to 14), and various provisions for vocational schools and classes. The leading private institutions of collegiate rank in the state are: Yale university, New Haven; Wesleyan university, Middletown; Trinity college, Hartford; Hartford Seminary foundation, Hartford; Connecticut College for Women, New London; Albertus Magnus college, New Haven and St. Joseph's college, West Hartford.

In Sept. 1941 there were 3,968 on WPA pay rolls, receiving $293,418, while the state supplied general relief to 26,203 individuals, amounting to $354,812; it paid old age assistance to 17,594 persons, totalling $509,094; widows' aid to 3,983 ($51,585); blind aid to 272 ($6,890). Under unemployment compensation in the last week of Sept. 1941, 3,313 applicants were paid $35,816.

Communication.—In the first ten months of 1941 the number of car registrations and licensed operators each increased more than 10%, to 556,608 and 628,498 respectively. For 1940 Connecticut was rated by the National Safety council as the state with the best safety record. The state highway system in 1941 included 2,863 mi. of trunk-line and state-aid roads, and about 1,600 mi. of town-aid roads. During 1941 work was pushed forward rapidly on the Wilbur Cross highway, an extension of the Merritt parkway through Hartford to the Massachusetts line.

There were 889 mi. of railroads in 1941, of which 90% belonged to the New York, New Haven and Hartford system. There were 18 approved airports and six seaplane units. The number of telephones in service Oct. 31, 1941 was 415,584.

Banking and Finance.—On Sept. 30, 1941, the 72 mutual savings banks in the state had total deposits of $765,432,113 and total assets of $858,322,611; the number of accounts increased to 1,014,934. The 64 state banks and trust companies had total assets of $450,496,379. The 52 national banks on June 29, 1940 had total assets of $366,578,000, of which $322,314,000 represented deposits. Hartford is the headquarters of most of the 25 large insurance companies operating under Connecticut charters.

The state income for the fiscal year ended June 30, 1941 was $88,037,793 and the net expenditures were $68,857,263. On June 30, 1941 the state's bonded debt was $33,350,000, which was in process of steady liquidation.

Agriculture.—The census of 1940 showed 21,163 farms in the state, containing 1,512,151 ac. and valued (including buildings) at $204,761,302. Of the farm land, 642,070 ac. were considered available for crops. In spite of a serious shortage in rainfall, the agricultural production of the state in 1941 was above the average. The dairy industry accounted for nearly half the value of farm products; poultry raising increased rapidly to second place; potatoes and garden products came third; tobacco, with an unusually good crop, returned more than $23,000,000, a 20% increase over 1940; apples and other fruits ranked fifth. Considerable quantities of hay and corn are also grown.

Manufacturing.—The census report showed, in 1939, 2,936 manufacturing establishments in the state employing 233,525 wage earners paid $276,274,243 and turning out products valued at $1,229,585,773. By Aug. 1941 it was estimated that 315,000 workers were employed in Connecticut industries. In defense work Connecticut ranked first in 1941 among the states in the production of aeroplane motors and propellers, submarines and small arms ammunition. It is also a large producer of aircraft, guns, ammunition, machine tools, cloth for parachutes, uniforms and tents, cutlery, locks, raincoats, overshoes, pumps, springs and blankets. The value of the principal classes of output in 1939 was: nonferrous metal goods $229,612,108; hardware, iron and steel products $163,817,129; textiles $152,105,492; machinery and machine tools $141,454,627; electric equipment and appliances $102,761,408; clothing $63,438,618; foods and beverages $54,563,674; chemicals $52,694,483. (G. M. Du.)

Conrad, Frank (1874–1941), U.S. radio engineer, was born May 4 in Pittsburgh. In 1912 he became interested in wireless telephony and during World War I he devised the only aeroplane radio set that saw much action. After the war, he enlarged his homemade station, built in a garage, and began broadcasting phonograph records. The program became popular and soon stores started advertising receiving sets. Impressed by the success of his broadcasts, Conrad turned over the idea for commercial broadcasts to the Westinghouse Electric & Manufacturing company, which licensed station KDKA in Pittsburgh and thus launched commercial broadcasts. Conrad, who was assistant chief engineer of the Westinghouse company after 1921, died in Miami, Fla., Dec. 11.

Conservative Party, Great Britain. For the fourth year in succession the National Union of Conservative and Unionist associations in England held no conference in 1941, but the party was active.

The report presented by the executive committee to the central council at their March meeting, after claiming that, unlike other parties, the Conservatives had suspended all propaganda since the outbreak of war, stated that their attitude was that, while changes in the social system might be desirable, the truce implied by the formation of a government representative of all parties should preclude attempts to advocate purely party policies. This recommendation was adopted, as also was an important resolution emphasizing the urgent need of the enlisting in the public services of younger persons of proved capacity, rather than those whose only quality was the mere possession of wealth or the backing of vested interests. These closely connected problems of attracting young candidates and eliminating the wealth factor, engaged the serious attention of the council during the year, and a further resolution was adopted in October, declaring that while the final choice of a candidate was a matter for local decision, approval might be withheld by the central organization if the choice had been affected by any financial offers made by the candidate. It was hoped that the adoption of this resolution would stop the tendency—in a minority of constituencies—to make wealth a qualification and would, at the same time, set a high standard to all political parties.

Lord Queenborough was re-elected president of the union, and Lt. Col. Sir Cuthbert Headlam, Bt., M.P., succeeded Lady Hillingdon as chairman. Sir Eugene Ramsden, Bt., M.P., was re-elected chairman of the executive committee. A special committee was set up to put before the prime minister its views on pensions, demobilization and resettlement, the future of the services and the mercantile marine, imperial and international relations, elec-

toral reform, education, housing, local government, agriculture and food production, industry and finance, and other problems that might be expected to present themselves after the war.

Erskine Hill, M.P., succeeded W. P. Spens, M.P., as chairman of the 1922 committee of Conservative private members, the most important of the unofficial committees of the house of commons, and the Rt. Hon. Sir Douglas Hacking, Bt., M.P., was appointed president of the National Society of Conservative and Unionist Agents. (L. H. D.)

Consumer Credit.

Consumer credit is extended through four general classes of institution: (1) cash-lending agencies, such as credit unions, industrial banking companies, small loan or personal finance companies, personal loan departments of commercial banks and pawnbrokers; (2) retail merchants, such as department, furniture, clothing and grocery stores, automobile and household appliance dealers, and jewellers; (3) service creditors, such as physicians and dentists, undertakers, public utility companies and laundries; and (4) intermediary financing agencies, such as sales finance companies and certain banks and manufacturers, which buy instalment sales contracts from retail merchants and dealers.

The total outstanding amount of consumer credit, exclusive of loans on real estate mortgages, which for a variety of reasons are usually treated separately, was estimated roughly at $9,200,000,000 at the close of 1940. Some 60% of this amount represented balances on instalment contracts. The remainder represented charge accounts and term credits. Table I gives estimates of instalment and of charge account and term credits by classes of credit-granting agencies.

Table I.—*Consumer Credit Balances at the Close of 1940*

(In millions of dollars)

Class of Agency	Instalment Credit	Charge Account and Term Credit
Cash-lending agencies	$1,590	$ 620
Retail merchants	1,454	2,386
Service creditors	66	492
Intermediary financing agencies	2,582	..
	$5,692	$3,498

Of the total amount of instalment sales credit-granting at the close of 1940—roughly $4,000,000,000—almost 45% arose out of sales of new and used automobiles. Household appliances accounted for some 18% of the total; furniture and pianos for about 14%; house fixtures and improvements for about 9%; and clothing for about 4%.

The outstanding amount of consumer credit fluctuates with the business cycle. But it grew substantially during the period for which estimates were available. Estimated outstandings increased from $4,300,000,000 at the close of 1923 to $8,200,000,000 at the close of 1929, declined to $4,600,000,000 in March 1933, rose to $8,500,000,000 in Aug. 1937. After a precipitate decline through 1938, expansion was renewed until it approached $10,000,000,000 at the end of Aug. 1941. Instalment sales credit was subject to the greatest fluctuations and it had the greatest growth, partly because of a general lengthening of the period of repayment in individual contracts. Table II gives estimates of outstanding balances of instalment sales credit and total consumer credit from 1929 to 1940.

Historically, public interest in the consumer credit field has been confined to preventing fraud, harsh collection practices, and excessive interest charges. Legal restrictions upon loans go back to the time of Moses and before. Today, most cash-lending agencies operate under special statutes which limit their charges and impose other restraints for the protection of borrowers. There has been a tendency to subject instalment selling to somewhat similar legal regulations. Indiana in 1934, Wisconsin in 1935 and Maryland in 1941 enacted laws for this purpose.

Table II.—*Outstanding Amounts of Instalment Sales Credit and Total Consumer Credit, 1929 to 1940*

(Amounts in millions of dollars)

Close of	Instalment Sales Credit	Total Consumer Credit	Close of	Instalment Sales Credit	Total Consumer Credit
1929	$3,300	$8,183	1935	$2,380	$6,080
1930	2,830	7,570	1936	3,240	7,435
1931	2,180	6,442	1937	3,638	8,326
1932	1,400	4,957	1938	2,841*	7,392*
1933	1,500	4,807	1939	3,291*	8,076*
1934	1,830	5,222	1940	4,036*	9,190*

*Preliminary.

Consumer Credit and National Defense.—During 1941, however, government also recognized an interest in the economic consequences of consumer credit. Under an executive order issued by the president of the United States on Aug. 9, 1941, the federal reserve board undertook to regulate the terms on which instalment credit might be extended. Regulation W, which became effective Sept. 1, 1941, prescribed minimum down-payments for a list of articles and limited the period of payment for these articles and for instalment loans of less than $1,000 to 18 months. A subsequent amendment extended the maturity limitation to loans of $1,500, prohibited loans to make down-payments, required down-payments in connection with instalment loans to buy listed articles, and limited the maturity of contracts consolidating previous instalment accounts to 15 months.

The objectives of these regulations were threefold: (1) to restrict demand for goods that competed with defense weapons for scarce materials, (2) to compel a liquidation of consumer credit as a means of partially offsetting the inflationary effects of the expansion of the government debt, and (3) to build up a backlog of civilian demand that might be called upon when defense spending stopped.

The tightening of instalment credit terms had a prompt and substantial effect upon sales of automobiles, pianos, refrigerators, plumbing and heating equipment, gas and electric ranges, higher priced radios and sewing machines and other goods for which periods of payment had been customarily long or down-payments small. Sales of vacuum cleaners, washing machines, cheaper radios and furniture dropped off moderately. During the first eight months of 1941, consumer credit expanded at a rate exceeding $100,000,000 a month. In September this trend was reversed, and during the last four months of the year, outstanding balances were liquidated at a rate approximating $150,000,000 a month.

While the control of consumer credit was initiated as an emergency device to cushion the impact of armaments expenditures, it was urged by some that such a control would be equally useful in peacetime to reinforce the monetary weapons available to the federal reserve board. (*See* also LAW.)

Contract Bridge.

One of the primary changes in the Culbertson system involved the traditional honour-trick table. Certain card combinations were assigned a slightly lower valuation, viz., K-Q-J, which theretofore had been counted as 1½ honour-tricks, was reduced to one-plus honour-trick. More important, however, singletons and voids were translated into honour-trick values so that the player who held a singleton or void was authorized to count a plus value toward his honour-trick total for this distributional factor.

For many years 2½ honour-tricks with a five-card suit had been the traditional requirement for opening the bidding. Thus constrained, players sometimes passed out hands which would have produced a game, or at least a valuable part-score. To relieve this situation a new provision was made for opening the bidding on two-plus honour-tricks if the hand contained a six-card major suit.

Biddable suit requirements were also lowered somewhat, as were the minimum requirements for an original notrump bid. In the new system an opening notrump is based on 3½ to 4 honour-tricks with balanced distribution.

Perhaps the most fundamental change was in connection with the opening two-bid and its responses. No revision was made in the forcing bid itself, but the responses were changed radically. In the old Culbertson system the responder required at least one, and usually one-plus or more honour-tricks, to make a so-called positive response; lacking these values, he had to answer with the artificial "two notrump" denial. Though this technique worked fairly well, it was found that in many cases a partnership

never located its best combined trump suit, *e.g.*, often the responder held nothing but a long suit headed by a king or queen and never found a safe opportunity to show that suit. The new system was designed to correct this evil. It provides that the responder (to an opening two-bid) should answer with two no-trump (a negative response denying strength) only when holding one honour-trick or less with no biddable suit as good as six low cards, or a five-card suit headed by K or Q-J. If the responder does hold any six-card suit, or a five-card suit as good as K or Q-J high, he must bid the suit at the lowest possible level, regardless of the general strength of his hand. (*E.g.*, if the opening bid is two spades and the responder holds six diamonds headed by the ten-spot or lower, with no face card of any description, his correct initial response is three diamonds. Later, of course, he will sign off at every opportunity.)

To compensate for the somewhat lowered requirements for opening the bidding with simple suit bids of one or with one no-trump, ordinary responses were "stepped up" a shade. Thus, in order to hold the bidding open at all with a simple one-over-one suit response, at least ½ honour-trick is required, and with that little the responder must hold a six-card suit. With one honour-trick he may respond at the one level in a five-card suit, or with two suits stopped, may bid one notrump. In order to increase the contract, *i.e.*, to bid two of a suit over an opening suit bid of one, responder requires one-plus to 1½ honour-tricks with a six-card suit or two honour-tricks with a five-card suit.

Other changes in the system were, most of them, of a minor nature.

Despite the war, bridge of all descriptions (duplicate, rubber bridge and team-of-four) continued to flourish in the United States and Canada, and even enjoyed increased popularity in England. Tournament bridge had its greatest year. The American Contract Bridge league, which fosters most of the tournaments in the United States, has grown steadily until in 1941 it had about 15,000 members, and about one-third of these were on the National Master Point list. The annual charity event held by the league, known as the "Have a Heart—Take a Hand Party," raised several thousand dollars for the children's ward of the Memorial hospital in New York city.

Because of the war and of the fact that co-operating committees in England, France and the United States were not able to meet, the contemplated changes in bridge laws were deferred. No changes of any description were made in this department.

(E. CUL.)

Convoys: *see* BLOCKADE.

Copper. While production data are lacking from many countries, the world smelter production of copper in 1940 was estimated at 2,250,000 metric tons, against 2,161,500 tons in 1939, an increase of 4% as compared with an increase of 9% in 1939. The distribution of the output is shown in Table I.

Table I.—*World Production of Copper*
(In thousands of metric tons)

	1929	1937	1938	1939	1940

Ex. U. S.	990.5	1,514.2	1,479.1	1,494.7	1,440.0

Aside from the United States, data for 1941 were scattered and incomplete, but such information as was available is given as an indication of the trend during the year.

United States.—In 1940 the production of copper in the United States was as follows: recoverable metal content of ore (mine production) was 878,086 short tons; smelter production was 909,084 tons; and refinery production was 1,431,225 tons. The surplus of smelter and refinery production over the preceding figures is largely a measure of the extent to which scrap copper is returned to the plants for reworking, though of course variations in the stocks of raw materials affect the totals.

Table II.—*Mine Production of Copper in the United States*
(Thousands of short tons)

	1936	1937	1938	1939	1940	1941
Alaska	18.9	17.3	14.5	0.1	0.1	0.1

Total	614.5	842.0	557.8	728.3	878.1	965.0

In 1941, mine production to the end of October was 802,137 tons; according to the current rate of output, the year's total could hardly be expected to exceed 965,000 tons, and might fall somewhat short of this; at any rate, the increase over 1940 would be approximately 10%, against 21% increase in 1940. Table II shows the estimates for the state outputs in 1941, which, though based on incomplete returns, should be sufficiently accurate to serve for comparison. These figures indicate declines in output in Colorado, California and Washington; Idaho, Montana, Nevada and New Mexico just about break even, and most of the increase for the year came from Arizona and Utah, with a small amount from Michigan.

To the end of Nov. 1941, members of the Copper institute reported a smelter output of 927,870 tons, against 907,382 tons in the same period of 1940; the full year was estimated at 1,014,000 tons, against 992,293 tons in 1940, an increase of only 2%, against 19% in 1940. Refined output showed up somewhat better, being estimated at 1,120,000 tons in 1941, against 1,033,710 tons in 1940, an increase of 8%.

Deliveries to domestic consumers in 1940 were 1,001,886 tons, and for export 48,507 tons; in 1941 export deliveries dropped to almost nothing, while deliveries to domestic consumers were supplemented heavily by imported copper, being estimated at 1,500,000 tons for the year. Since 1939

Table III.—*United States Foreign Trade in Copper*
(Millions of pounds)

	Imports	Exports	Balance
1936	380.7	524.8	Net export, 144.1
1937	559.7	700.0	" " 140.9
1938	504.3	844.0	" " 339.7
1939	672.6	855.2	" " 182.6
1940	982.7	855.9	Net import, 126.8
1941 (9 mo.)	990.6	217.4	" " 773.2

deliveries ran ahead of production plus imports, so that stocks declined heavily, the total decrease being 112,485 tons in 1939, 58,130 tons in 1940, and 125,617 tons to the end of Sept. 1941, after which there had been a slight improvement. Stocks of refined copper, not including consumers' stocks, were down to 65,670 tons at the end of September, but had recovered to 72,352 tons at the end of Nov. 1941. This turn in the tide was a welcome one, because the reserves were too low to carry much longer at the former rate of depletion. However, after the United States was forced into the war as an active participant, it seemed probable that increased demand would result in further lowering of the already too low reserves. It might be that consumers' stocks were sufficient to carry the drain for a time, but in any case it was evident that additional supplies were urgently needed. To furnish these the United States had three possible sources on which to draw: increased domestic mine production, increased imports and increased recoveries of secondary metal.

Secondary recovery of copper from scrap supplied a surprisingly large proportion of the consumption. In 1940 the secondary copper recovered totalled 532,046 tons, of which 170,839 tons was as metal, 341,776 tons was in brass and other alloys, and 9,431 tons in chemicals. Since mine production in 1940 was 878,086 tons, it would appear at first glance that scrap recovery supplied 60% as much copper as did the mining industry, but this figure is distorted. Of the total secondary recovery, 198,156 tons was in the form of new scrap, and 333,890 tons in old scrap; in other words, 37% of the secondary recovery was from plant scrap produced in the fabrication of finished products, had never been in use, and simply needed to be returned for remelting; on the other hand, the remaining 63% of the secondary recovery was worn out material that had been discarded from the pool of metal in use, and this represented 38% of the mine output of new metal, which still remains an impressive figure.

War demand caused a radical shift in the trend of foreign trade in copper, as is shown in Table III.

In the past much of the copper imported was for smelting, refining, and re-export, and such amounts as were imported for consumption were more than balanced by exports of domestic copper, so that all told there was a

definite export balance. As a result of the increased imports, this was materially reduced in 1939, and later a decrease in exports shifted the balance to the import side.

Belgian Congo.—No information was available on operations, but shipments from the Congo received in the United States during the first three quarters of 1941 totalled about 32,800 tons of copper that had formerly gone to Belgium.

Chile.—Exports of copper from Chile during the first three quarters of 1941 were 320,998 metric tons, against 273,462 tons in the same period of 1940; of this total, 294,079 tons went to the United States, and 16,174 tons went to Japan in the first quarter, but none later. Japan also took 5,838 tons of ore and concentrates, against 308 tons to the United States.

Mexico.—Copper content of ores and concentrates produced in the first half of 1941 was 25,343 metric tons, as compared with 18,660 tons in the same period of 1940.

Peru.—Production for the first eight months of 1941 was 19,900 metric tons, a monthly average of 2,500 tons, against 2,800 tons in 1940.

Philippine Islands.—Copper production in ore, concentrates and matte was 10,200 short tons in 1940, and was expected to be nearly 11,000 tons in 1941. Exports were largely to Japan—6,074 tons in 1940, and a prospective 4,500 tons in 1941.

South Africa.—Production during the first half of 1941 included 4,920 short tons of ingot and 6,457 tons of blister copper, as well as 2,195 tons of copper-gold concentrates. Exports were 3,218 tons of ingot and 6,681 tons of blister. Metal production and exports were both about double those of the same period of 1940, due to the operation of a new plant. Copra: *see* COCO-NUTS.

Copyright. During the year 1941 the copyright law of the United States was amended in one important respect by Public Act. No. 258, 77th congress, approved, Sept. 25, 1941. The president by proclamation may grant an appropriate extension of time to those persons who, because of disruption and suspension of facilities resulting from the international emergency, are prevented from complying with the conditions and formalities required by the copyright act.

Other bills for general revision of the copyright law were introduced in congress in 1941. Thus far, however, consideration of matters of critical importance to the nation have confined changes in copyright legislation to the amendment above recorded.

During the fiscal year ending June 30, 1941, 180,647 registrations of claims to copyright were made in the copyright office. The total fees received amounted to $374,125.35.

The copyright act in force requires, as one of the conditions precedent to the registration of a claim of copyright in any published work, the deposit of two copies of domestic works and one copy of foreign works. One of the basic purposes of this provision is to secure copies of editions best suited to the enrichment of the Library of Congress. The number of books and other articles deposited in connection with registrations made during the fiscal year amounted to 283,737, of which number 171,115 were transferred to the Library of Congress. These included 67,979 books, 74,460 periodical numbers, 22,530 pieces of music, 2,560 maps and 1,586 photographs and engravings. (*See* also LAW.)

(C. L. B.)

Corn (MAIZE). Production of corn in the United States in 1941 averaged 31·1 bu. per acre, the highest yield in the 75 years of record excepting in 1906, when the yield was 31·7 bu. per acre. The 1941 crop was estimated by the department of agriculture Nov. 10 as 2,675,373,000 bu., compared with 2,449,000,000 bu. in 1940, and a ten-year (1930–39) average of 2,307,452,000 bu. The acreage in 1941 was 85,943,000 ac.; that of 1940 was 86,449,000 ac.; the ten-year average, 98,049,000 ac. The per-acre yield in 1940 was 28·3 bu., and the ten-year average was 23·5 bu. The higher yield in 1941 was due to the expanding use of hybrid varieties throughout the corn belt. The yield was reached despite unusually wet weather during the harvest season, when husking operations were severely hampered and there was loss from wet-weather sprouting of ears on the ground.

In Canada the first official estimate placed the 1941 crop at 11,906,000 bu., compared with 6,956,000 bu. in 1940. In Argentina the corn crop harvested in 1941 was 403,048,000 bu., about 5,000,000 bu. less than the 1940 crop. The corn surplus in Argentina in 1940 and 1941 and the almost complete loss of European export markets became so burdensome that the government made extensive efforts to find other uses for the grain, such as fuel in industrial plants and in homes. Corn fuel briquettes and corn ears coated with petroleum by-products were used in Argentina.

U.S. Corn Production by States, 1941 and 1940

State	1941 bu.	1940 bu.	State	1941 bu.	1940 bu.
Iowa	465,171,000	460,581,000	South Carolina	23,814,000	24,304,000
Illinois	404,231,000	332,244,000	Louisiana	22,170,000	24,128,000
Minnesota	200,116,000	172,457,000	Maryland	16,135,000	17,535,000
Indiana	177,163,000	145,609,000	Colorado	15,555,000	10,656,000
Ohio	159,348,000	120,750,000	West Virginia	13,290,000	12,852,000
Nebraska	152,280,000	106,913,000	New Jersey	7,869,000	7,371,000
Missouri	116,112,000	119,280,000	Florida	7,533,000	9,031,000
Wisconsin	89,280,000	93,582,000	Delaware	4,110,000	3,948,000
Kentucky	78,848,000	70,400,000	New Mexico	3,325,000	2,376,000
Texas	69,480,000	90,324,000	Montana	3,145,000	2,544,000
Tennessee	69,156,000	69,175,000	Wyoming	2,928,000	1,930,000
Pennsylvania	56,594,000	53,640,000	Vermont	2,880,000	2,627,000
Kansas	56,544,000	41,028,000	California	2,310,000	2,240,000
Alabama	52,266,000	43,450,000	Connecticut	2,058,000	1,960,000
South Dakota	50,112,000	50,112,000	Oregon	1,890,000	1,860,000
Michigan	48,352,000	49,856,000	Idaho	1,560,000	1,202,000
Mississippi	47,753,000	40,544,000	Massachusetts	1,558,000	1,558,000
North Carolina	47,400,000	43,507,000	Washington	1,260,000	1,146,000
Georgia	42,934,000	46,849,000	Utah	638,000	616,000
Arkansas	38,817,000	42,903,000	New Hampshire	630,000	600,000
Virginia	33,711,000	36,400,000	Maine	492,000	507,000
Oklahoma	31,202,000	40,356,000	Arizona	406,000	362,000
North Dakota	26,266,000	24,480,000	Rhode Island	360,000	369,000
New York	26,109,000	21,452,000	Nevada	150,000	120,000

Silage yields were above average in all sections of the United States in 1941, the department of agriculture reported. No figures on corn production in Europe were available in 1941, except for Spain, where the 1941 crop was estimated at 27,749,000 bu., compared with 29,202,000 in 1940. Corn, however, is not a principal crop, as in the United States and Argentina. (*See* also CEREALS.)

(S. O. R.)

Cornell University. A university of higher learning, nonsectarian and coeducational, at Ithaca, N.Y., founded in 1865 and incorporated as a land-grant college under the Morrill act of 1862. The university comprises the endowed schools and colleges of arts and sciences, engineering, architecture, law and medicine (located in New York city and operated in conjunction with the New York hospital), and the state-supported colleges of agriculture, home economics and veterinary medicine. Two experiment stations, at Geneva and Farmingdale, N.Y., are operated in connection with the college of agriculture. Degrees for advanced study other than professional are awarded through a graduate school. During the academic year 1940–41, there were 7,315 students, of whom 1,559 were women. The faculty, which had 1,831 members, included 53 emeritus professors, 334 professors, 76 associate professors, 261 assistant professors, 34 lecturers and associates, 502 instructors and 571 assistants. New educational offerings during the year included a five-year program of training for secondary-school teachers, centring in the school of education, and a new five-year course for teachers of art in the elementary and secondary schools operated jointly by the college of architecture and the school of education. Productive funds on June 30, 1941, amounted to $32,445,803. Land and buildings were valued in 1941 at $19,894,100, and equipment at $8,318,828. The library contained 1,094,117 volumes.

(E. E. D.)

Cornhusking. The championship of the United States for picking and husking corn in 1941 was won by Floyd Wise of Prairie Center, Ill. In the national contest sponsored by the *Prairie Farmer* magazine in Tonica, Ill., Wise picked 45·37 bu. in 80 minutes, competing against 21 of the fastest corn pickers from 11 states. Leland Klein of Illinois picked 45·214

bu.; Ivyle Carlson of Iowa picked 44·36 bu.; Irvin Bauman of Illinois, whose record of 46·71 bu. won him the 1940 national crown, did not compete. A huge crowd of about 100,000 people witnessed the 18th annual cornhusking championship. (J. B. P.)

Costa Rica. A central American republic; area, 23,000 sq.mi.; pop. (1941 official est.), 668,060; capital, San José (pop. 66,800). Other principal cities are Heredia, Alejuela and Cartago, in the interior, and the ports of Puntarenas (Pacific) and Puerto Limón (Caribbean), with from 7,000 to 10,000 population each. President, Rafael Angel Calderón Guardia.

History.—Throughout 1941 Costa Rican public opinion was, in keeping with the country's traditional democratic feeling, strongly Pan-American and anti-axis. In January the government banned the dissemination of totalitarian propaganda through the mails and deported two Germans in May on charges of pro-axis activities. These and other anti-axis measures, including seizure of axis ships in May, prompted a German demand in August for withdrawal of Costa Rican consuls from German-dominated areas. A nation-wide anti-axis demonstration followed, resulting in the expulsion of all German consular representatives. In December, when Japan attacked the United States, Costa Rica immediately declared war—preceding even China in its formal declaration—and quickly followed with declarations against Germany and Italy.

Defense measures involved the close co-operation of the United States. In June Costa Rica obtained a U.S. credit of $500,000 to acquire war materials, and two months later an agreement authorized the sending of a United States military mission to Costa Rica. At the same time efforts were made to enlarge the army, estimated to comprise some 350 men.

Negotiations begun in 1940 culminated in 1941 in a $4,600,000 loan by the United States Export-Import bank, to further work begun on the Costa Rican portion of the Inter-American highway and to stabilize Costa Rican currency. Important also was the signing of a boundary agreement with Panama, thus marking the disappearance of a long-standing and potentially dangerous dispute.

Education.—Costa Rica, the cultural centre of Central America, has 671 public schools (64,594 pupils). The national university is at San José. Costa Rica's literacy rate (76%) is one of the highest in Latin America.

Finance.—The monetary unit is the colón (value: approx. 17¼ cents U.S. in 1941).

Trade.—In 1940 imports (chiefly foodstuffs and manufactured goods) totalled $16,840,463 (United States, 75%; Great Britain, 4.5%); exports were $7,483,957 (United States, 58.8%; Great Britain, 25.1%). Coffee (53.3% in 1940), bananas (25.4%) and cacao (8.1%) are the most important exports.

Communication.—Steamship lines link both coasts with the principal ports of the world. San José is a main stop on the Pan American Airways line, while domestic air lines connect the chief cities. There were 320 mi. of railways in 1941. The 1,800-mi. highway system is inadequate, especially in linking the coast with the plateau districts. The Inter-American highway was in process of construction during 1941 through the difficult mountainous terrain near the Panama border. When completed, Costa Rica's 312-mi. section of the highway will be the longest of any single Central American country. (L. W. BE.; L. C. DEA.)

Cost of Living. The upward trend of the cost of living characteristic of almost the entire world after 1933 continued into 1940–41. It was sharply accelerated in 1941 as the war spread over more and more of the world.

The cost of living rose materially in Great Britain, Norway, Sweden and Italy in 1940. In Germany government control of prices prevented the sharp upward price trend which might have been expected otherwise in view of their diminished supplies of many products.

The price indexes of the other countries moved upward during 1940 at a slower rate. The United States cost of living rose less than 5% during the first year of the war.

Indexes of Cost of Living for Specified Periods for the United States and Certain Foreign Countries

*Table compiled from *International Labour Review*, Oct. 1941.

Late 1940 and the first three-quarters of 1941 saw a sharp rise in the cost of living in most if not all countries. The current statistics for some countries are so inaccurate, as a result of the war, that they have to be used with mental reservations.

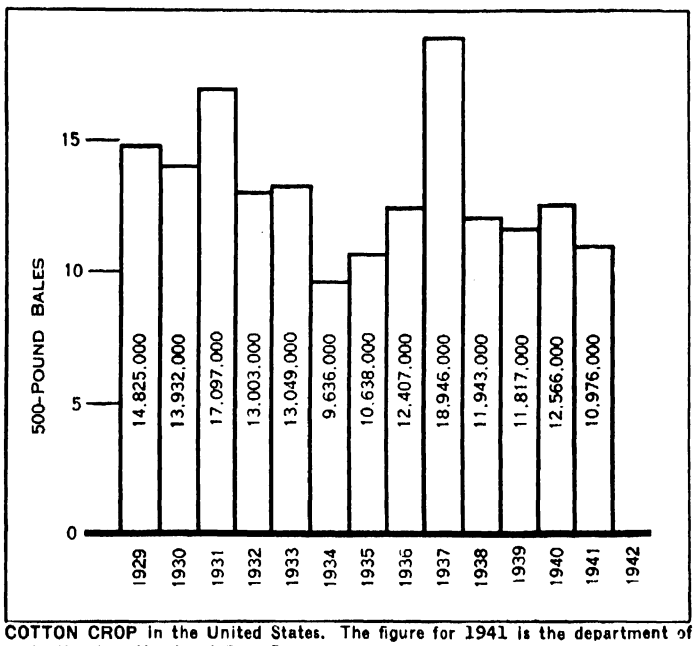
In the United States, the index number for all foods (1935–39 =100) rose in 51 large cities from 93·5 on Aug. 15, 1939, to 96·2 on Oct. 15, 1940; 111·6 on Oct. 15; and 113·1 on Nov. 15, 1941. The American index number for clothing stood at 114·4 in Nov. 1941; for rent, at 107·9; and for house furnishings, at 115·8 (preliminary figures). Great Britain, Norway and Sweden show particularly rapid increases in 1941, the other countries more gradual ones.

In 1939 there was a slight increase during the early part of the year and a more substantial upward movement during the late summer and fall. Early 1940 figures showed slight increases.

The accompanying table shows the relative trends of cost of living in 11 countries from 1929 through July 1941. The figures have been recalculated by the International Labour office on a 1929 base and this table cannot be compared directly with the table published for 1937 and previous years. (*See* also BUSINESS REVIEW: *Commodity Prices;* PRICES; WEALTH AND INCOME, DISTRIBUTION OF.)

BIBLIOGRAPHY.—Readers interested in additional information are referred to current issues of the *Monthly Labor Review* (U.S. bureau of labour statistics), the *Ministry of Labour Gazette* (British ministry of labour), and *The Labour Gazette* (department of labour, Canada). *Cf.* also *International Labour Review.* (D. D. L.)

Cotton. Spread of the World War in 1941 cut off all continental Europe from international trade in cotton, excepting Portugal and Spain, which could import under British



COTTON CROP in the United States. The figure for 1941 is the department of agriculture's estimate of Dec. 1.

naval certificate, and excepting an inconsequential quantity of Turkish cotton which might get through to Germany. Entry of the U.S.S.R. into the war June 22 stopped all exports of Russian cotton to Rumania, Hungary, Bulgaria and Finland. With the freezing of Japanese credits in July by the United States, Great Britain and the Netherlands, the great Japanese cotton industry slumped sharply, with 1,250,000,000 sq.yd. of cloth goods on hand, and later came to a virtual standstill. These developments, further complicated by shortage of ocean shipping, indicated that world exports of cotton in 1941–42 would be considerably reduced from the low figure of 1940–41, when only 6,300,000 bales were exported, as compared with 12,500,000 bales in world trade in 1939–40.

In contrast to reduced world trade in cotton, production of the staple continued at a high rate, to such an extent that Egypt offered a bonus for conversion of cotton lands to food crops. In the United States, although the government urged unprecedented increase in most farm crops, cotton was one of the three major crops on which the government in 1941 still maintained a curb on production. The other two were wheat and tobacco. The fact that only five cotton crops in the period 1910–40 were smaller than the 1941 crop indicated a trend away from the burdensome surpluses of cotton common in the United States prior to World War II. Production of cotton in the United States in 1941 was 10,976,000 bales, compared with 12,566,000 bales in 1940 and a ten-year (1930–39) average of 13,246,000 bales. The acreage harvested in 1941 was 22,376,000. In 1940 it was 23,861,000 ac.; the ten-year average was 31,223,000 ac. The yield was 235·4 lb. to the ac. in 1941 and 252·5 in 1940; the ten-year average was 205·4 lb. to the ac. The U.S. department of agriculture estimated 65 lb. of cotton-seed produced to each 35 lb. of cotton (lint). On that basis cotton-seed production in the United States in 1941 was 4,892,000 tons. It was 5,595,000 tons in 1940; the ten-year average was 5,890,000 tons. (For U.S. lend-lease shipments of cotton and cotton products to Great Britain *see* FARM INCOME.)

Brazilian cotton, at 4 to 5 cents per lb. cheaper than United States cotton, made considerable inroads in the market in Canada, where production of cotton textiles had greatly increased. A considerable part of the Canadian manufacture consisted of war materials for the U.S.S.R. and China. In the six months ending July 31, 1940, Canada consumed 202,573 bales (running bales of 500 lb.) of United States cotton and 893 bales of Brazilian cotton. In the following six months, Canadian consumption was 125,897 bales of United States and 86,533 bales of Brazilian cotton, while in the six months ending July 31, 1941, Canadian mills used 81,111 bales of United States cotton and 161,537 bales of Brazilian cotton. The 1941 crop in Brazil was estimated at 2,557,000 bales (478 lb. to the bale), with 1,333,000 bales exported during the year ending July 31, 1941. A record carry-over estimated at 450,000 to 700,000 bales taxed storage space in São Paulo, and an estimated 10% increase was foreseen for the crop to be harvested in March–June 1942.

The 1941 cotton crop in India was estimated at 5,021,000 bales (478-lb. bale) compared with 5,439,000 bales in 1940. India lost its two principal cotton markets, China and Japan, in the summer of 1941 when the United States, Great Britain and the Netherlands froze Japanese credits, and the Chinese could not obtain enough foreign exchange or shipping facilities to maintain imports.

China's 1941 cotton crop was estimated by the United States' agricultural attaché at Shanghai as about 2,400,000 bales, an increase of 50,000 bales over that of 1940. The Manchurian crop was 93,000 bales in 1941, a 20% increase over that of 1940. The Japanese provided $352,000 for bounties to increase the cotton acreage in Chosen, which planted 810,000 ac. to cotton in 1941 to augment supplies.

Egypt produced 1,640,000 bales of cotton in 1941, as against 1,900,000 bales in 1940. On Oct. 30, 1941, the government issued a decree offering to growers $7.95 per ac. in Upper Egypt and $5.96 per ac. in Lower Egypt to convert cotton lands to the production of wheat, barley and beans. Acreage for the 1942 crop was ordered reduced by 20% under the 1940 planting of 1,749,000 ac. Cotton textile production in Egypt was put under military supervision to prevent profiteering. Great Britain agreed to buy one-half the Egyptian crop of 1942 at 11.41 to 16.5 cents per lb., the Egyptian government to pay 1.67 cents per lb. more for the remainder and also pay 1.67 cents per lb. to growers selling to Great Britain.

Bolivia embarked on an ambitious program in 1941 to become a cotton-producing country. Bolivian cotton acreage had averaged about 800 ac., but the country was said to have 270,000 ac. suitable for cotton in 1941. A tariff on cotton imports was imposed in 1941, and an assessment was ordered against each manufacturer according to his imports of cotton. This assessment was placed at one-fourth cent per lb. in 1941, but was to be increased gradually to 10.7 cents per lb. of imported cotton by 1950, and, with the cotton tariff revenue, was to provide funds to extend cotton growing.

Table I.—*Cotton Production in Certain Countries, 1941 and 1940*

Country	1941 bales	1940 bales
Peru	330,500	382,900
Mexico	333,000	288,000
Argentina	232,000	362,000
Iran	208,000	231,000
Nigeria	29,000–33,000	55,000
Rumania	21,000	8,500
Haiti	13,000	9,200
Ecuador	11,700	9,200
Spain	9,200	....

The cotton shortage in Europe, where textile mills ran only part-time in 1941, was reflected in Bulgaria's subsidizing efforts which increased the cotton acreage from 129,000 ac. in 1940 to 178,000 ac. in 1941. The normal Bulgarian crop is 45,000 bales. The 1941 production was not reported. Great Britain traded 90,000 bales of Belgian Congo cotton to

Table II.—*U.S. Production of Cotton in Leading States, 1941, 1940 and 1930-39 Average*

State	1941 bales	1940 bales	1930–39 (Annual average) bales
Texas	2,745,000	3,234,000	3,766,000
Arkansas	1,445,000	1,501,000	1,281,000
Mississippi	1,420,000	1,250,000	1,585,000
Alabama	700,000	779,000	1,145,000
Georgia	624,000	1,010,000	1,137,000

Spain for wool to relieve an acute cotton shortage in the latter country; Spain had been unable to finance a purchase of 196,000 bales of cotton from Brazil. The Nigerian crops of 1940 and 1941 remained in storage for lack of ocean shipping. (S. O. R.)

Cotton Manufacture.—The national defense program from Jan. 1 to Dec. 7 and the war program from Dec. 7 to Dec. 31, completely dominated the progress of the cotton textile industry in 1941. Never before had it been pushed to such high production levels or placed under such a strain of conflicting forces: unprecedented demand on the one hand, and price ceilings on the other. The net result was an all-time high record of consumption of cotton and of production of cotton textiles. The mill activity was approximately one-third greater than that of 1940, which in turn had set a high record to date.

The pressure of government purchases created several serious situations in cotton textile production. One of the most difficult of all was that in duck. During the period from Sept. 1, 1940, to Nov. 11, 1941, 64,000,000 yd. of duck were purchased by the quartermaster corps. But even this did not meet the full needs of the army, as gauged by their estimates; bids were undersubscribed. Another bottleneck was combed yarn, specified in several important quartermaster articles, including cotton-twill uniform cloth, cotton shorts, undershirts, etc. Because of the extreme pressure on this item, it was found necessary to modify the specifications to some degree. Despite these bottlenecks, however, the industry met the demands of the defense and war programs in a highly satisfactory way, and at the same time produced materials for civilian use at a very high rate.

It was estimated that about 20% of the 1941 output of cotton goods went into strictly military channels while another 20% was purchased as industrial fabrics by those branches of American industry supplying instruments of war. The remaining 60% went into the ordinary outlets.

It was recognized, of course, that 1942 would present far more serious problems to the industry than did 1941. With the prospect of an infinitely larger army than was contemplated prior to Pearl Harbor, the percentage of the industry's product going into war use would be sharply increased. Furthermore, the balance of the equipment not operating on such products would find it difficult to secure machine parts, and even to some extent materials and labour. In this respect the cotton textile industry was particularly well situated, since a large part of its labour is female, and also since there has been right along a surplus of raw cotton. However, that surplus was not as reassuring as was generally believed. There were many grades and staples in short supply. In fact it was the belief of many that what was needed was a reversal of attitude: namely, the substitution of a crop-expansion program for the crop-reduction program which had been in existence since 1933.

Experience in Lancashire.—Naturally, the experience of the British cotton industry, after more than two years at war, was followed closely by students of the cotton textile industry in the United States. Particular interest was attached to the "concentration of production" program conducted in Lancashire. This meant, in essence, the elimination, at a compensation, of mills classed as "redundant" and the concentration of production in the more efficient units, known as the "nucleus" mills. As of the latter part of 1941, out of close to 2,000 firms in cotton manufacturing which had been classified thus far under the concentration scheme, about 60% had been allowed to continue operations. Most of the remaining firms had closed down or were to do so in the near future. Two difficulties encountered were, first, the fact that the production capacity in the "nucleus" mills was found insufficient to cope with all important demands; and, second, the problem of finding other types of labour for the employees turned out of work in the "redundant" mills, and of persuading them—particularly the women employees—to adjust themselves to other kinds of work.

The whole development in Lancashire was being watched in the United States in more or less the attitude, "It happened in Lancashire; it could happen here."

Price Ceilings.—American textile manufacturers did not have to look to Lancashire, however, for indications of what price control meant. It had its own experience at home. The cotton division of the industry was one of the earliest guinea-pigs; on May 24, price ceilings were set on combed cotton yarn. From then on, a bewildering series of such actions took place, gradually drawing in the other principal yarns and fabrics in the industry. The most important further change was the basic arrangement made in October whereby the ceiling prices of cotton gray goods were tied, or adjusted, to the market price of spot raw cotton. This was later extended to yarns. This automatic adjustment of manufactured products to the raw material was generally considered in the industry a decided improvement over the arbitrary ceilings previously set.

The function of the Office of Price Administration (*q.v.*) was the focal point of controversy throughout the year. The main objections raised by textile manufacturers to the methods of that organization were, first, the fact that ceilings were set piece-meal, first on one material and then on another, thus throwing out of line the price relationships among commodities and manufactured products; and, second, that ceilings on wages and on farm products were not included. These points of view were not confined to the cotton textile industry, but in fact represented one of the main avenues of controversy over the pending price legislation.

Wage-Hour Legislation.—When one recalls the excitement which attended the establishment of 32½ cents as the minimum hourly wage in the cotton textile industry in Oct. 1939, the change that occurred in 1940 and 1941 is dramatically revealed. An industry committee appointed by the wage-hour administrator to review this wage and its effect upon the industry recommended in April 1941 a 5-cent increase in the minimum wage, from 32½ to 37½ cents. It made barely an impression upon the industry and no opposition developed. The change in attitude was due primarily to the effect of the defense program, which had brought the industry to boom conditions. The next and last step that can be taken under the wage-hour law, an increase to 40 cents, the maximum provided by the statute, was recommended to become effective early in 1942.

Three-Shift Operation.—One of the most important effects of the defense demands upon the industry was the increase of a great many mills from two-shift to three-shift operation. In October, for example, operation of active machinery averaged 132.5% of two-shift production, a record which would have been practically inconceivable in 1940. Active spindleage in certain of the southern states averaged but slightly under a full three-shift run. Those mills which did not extend to three-shift operation failed to do so principally because of the lack of machinery to make possible a balanced 24-hour operation, and also because of the lack of sufficient labour for three shifts.

One of the principal results of World War I was an increase in the industry from one-shift to two-shift operation. The move in 1941 was from two-shift to three-shift. In the reaction which followed after the inflation from World War I, the serious aspects of this large increase in actual and potential operation were dramatized. It seemed inevitable that eventually the industry would have to suffer for this new form of expansion and that this suffering would take the form, again, of overproduction and depression.

Major Military Fabrics.—The tremendous scale of government demands for textiles can be visualized by a glance at the following table, which lists the more important cotton fabrics and other products purchased by the quartermaster corps during the period from Sept. 1, 1940 to Nov. 11, 1941.

Khaki cotton twill uniform cloth, yd.	45,158,892
Herringbone-twill cotton cloth, yd.	49,823,000
Cotton uniform cloth, yd.	61,060,000
Wind-resistant cloth, yd.	10,720,000
Cotton lining cloth, yd.	32,000,000
Cotton twill cloth (tent), yd.	22,285,000
Khaki cotton cloth, yd.	48,000,000
Cotton drill, bleached and unbleached, yd.	32,300,000
Cotton cloth, yd.	40,900,000
Canvas padding, cotton, yd.	6,305,786
Cotton webbing, yd.	8,350,000
Cotton jean cloth, yd.	3,000,000
Cotton duck, tent and O.D., yd.	64,000,000
Mosquito netting, yd.	40,000,000
Underwear, shirts and drawers	72,000,000

CULTIVATED COTTON being carried to market in 1941 in French Equatorial Africa (Free France)

Couch, Harvey Crowley (1877–1941), U.S. utilities and railroad magnate, was born Aug. 21 in Calhoun, Ark. After working on cotton farms and as a railroad mail clerk, young Couch and a friend organized the North Louisiana Telephone company, which he sold to the Bell Telephone company in 1913 for an estimated $1,500,000. With this capital, Couch and a few friends organized the Arkansas Power and Light company, which, with its affiliates, became one of the largest utilities groups in the southwest. In 1929 he ventured into the railroad field, purchasing two Louisiana roads, and in 1937 he acquired virtual control of the Kansas City Southern railway. In 1932 President Hoover made Couch a director of the Reconstruction Finance corporation, from which post he resigned in 1934. He died at his summer home on Lake Catherine, near Hot Springs, Ark., July 30.

Credit, Consumer: *see* CONSUMER CREDIT.

Crerar, Henry Duncan Graham (1888–), Canadian army officer, was born April 28 in Hamilton, Ont. Educated at Upper Canada college and the Royal Military college, Kingston, he was commissioned as a lieutenant in 1910. He served in France during World War I, advancing to the rank of lieutenant colonel. After the war, he was appointed a staff officer of artillery in the department of national defense, 1920, and became a general staff officer attached to the British war office, 1925. An expert on strategy, he later became director of military operations and intelligence in the department of national defense. After the outbreak of World War II, he went overseas with the rank of a brigadier and, in 1940, he was promoted to major general. He was subsequently appointed lieutenant general, but he voluntarily stepped down to major general in order to take a combat command as head of a Canadian division in Britain. Gen. Crerar took acting command of the entire Canadian corps on Dec. 26, 1941.

Cricket. In 1941, for the second year in succession first-class cricket, properly so called, was nonexistent in England; there were no county contests, no "tests," no "Gentlemen *v.* Players," and such university matches as there were were "off the record," so to speak. But the members of the forces who thronged Lords and other grounds—often to the financial advantage of the Red Cross or war distress funds—saw plenty of good cricket; and many of the clubs and most of the schools kept their grounds going wherever these had not been trenched or taken over for gun-sites, balloon barrages, or some other warlike purpose. So, in a season when the weather, for the most part, was none too summery and all the leading players were doing full-time jobs in one or other of the services, the game was kept much alive largely by elevens collected for the purpose. such as the London Counties (under the presidency of Jack Hobbs), Pelham Warner's, the British Empire, the Club Cricket conference and the services themselves.

The season at Lords, where admission was usually 6*d.*, uniformed spectators being let in free, opened with a lively game between the London Fire Services and Reading university and finished with a great match between the army and a Lords XI, when a crowd of 10,000 saw Denis Compton score a brilliant 114 for the army. Another fine match was that between Pelham Warner's XI and a British Empire side when the former team, which included six "test" players and two England captains, won by one wicket in the last few minutes of the usual one-day match. In school cricket the outstanding event was the game between the M.C.C. and Rugby played at Rugby on the same ground on which, 100 years earlier, was played the match immortalized in *Tom Brown's School Days;* again, as then, the secretary of the M.C.C.—this time an old Rugbeian—led his side, and again, as then, the M.C.C. won—though this time easily. An unofficial Eton *v.* Harrow was won by Eton, on her own ground.

In Australia a series of interstate matches, played for the benefit of the patriotic funds, took the place of the usual tournament for the Sheffield Shield, now held by New South Wales. In one of these—South Australia *v.* Victoria, resulting in a draw—both C. L. Badcock (S.A.) and R. L. Hamence (S.A.) scored centuries in each innings. Over the series as a whole New South Wales came out on top.

Crime. Completing their 12th year, the *Uniform Crime Reports* continued to present comparable data on the volume and distribution of criminal acts, although still largely confined in their scope to urban jurisdictions. As of Sept. 30, 1941, the reporting areas included 94·9% of all cities and towns in the United States with more than 10,000 population, and 98·5% of the total population of all communities of this character. Smaller cities, villages and rural townships (under 10,000 population) to the number of 1,927, and with an aggregate population of 9,731,037, were also included. Thus a grand total of more than 71,000,000 inhabitants was embraced in the reporting areas.

Crime in Cities, Towns and Villages.—The upswing in crimes that marked the latter years of the 1930–39 decennium was continued in some degree in 1940 and 1941. This was particularly true of murder and non-negligent manslaughter, aggravated assault, rape and auto theft. The unfavourable changes were not so large however as to suggest the resurgence of an actual crime wave, but rather resembled a slowly rising tide in certain categories of reportable offenses during these years. Whatever the significance of the change might have been, it was offset in part in 1941 by a decline in the rates for manslaughter by negligence, robbery and burglary, with at least a temporary stabilization in the figures for larceny.

A comparative statement of crime rates for the first nine months of the years 1939, 1940 and 1941 appears in Table I. It is based upon returns from 2,109 cities, towns and villages in 1941, from 2,025 such communities in 1940 and from 1,964 in 1939.

Table I.—*Offenses Known to the Police*

January-September, 1939–41 Inclusive; Rates per 100,000 of Population

Offense	1941	1940	1939	Offense	1941	1940	1939
Murder and Non-negligent Manslaughter	4.22	4.0	4.0	Robbery	35.3	39.1	40.7
				Aggravated Assault	36.9	34.8	34.3
				Burglary—Breaking or Entering	245.0	263.8	259.4
Manslaughter by Negligence	2.86	3.1	2.9	Larceny—Theft	681.8	690.3	652.1
Rape	7.17	6.8	6.8	Auto Theft	135.6	129.0	128.8

There were few changes in the geographic distribution of crime. The south Atlantic, east south central and Pacific states in general had the highest urban rates, with New England and the Middle Atlantic region having the lowest. Homicides and assaults reached their highest levels in the south; auto theft and burglary were highest on the west coast. The high position of the Pacific states was striking as to all categories except murder and non-negligent manslaughter.

Crimes tend to be relatively more frequent in the larger cities, with diminishing rates as cities dwindle in size. As in 1940, however, Group II cities (with populations from 100,000 to 250,000) dislodged the largest cities from their leading position in 1939, with a clear preponderance for 1941 in five of the eight criminal categories.

The percentage distribution of reportable offenses during 1941 showed larceny with 59·3% of the total, burglary 21·3%, auto theft 11·8%, robbery 3·1%. As from 1937 to 1940, these figures showed an increase for larceny, but relative declines for others. The relative frequency of crimes against the person, however, increased slightly in 1941 as compared with contemporary tendencies. In Table II the per capita rate for the several offenses, during the first three-quarters of 1941, is shown for 2,109 cities, towns and villages, grouped according to size, and with a total population of 64,267,531.

Table II.—*Crime Rates per 100,000 Population*
January-September, Inclusive, 1941

	Population Groups of Cities (000 Omitted)						
	I Over 250	II 100-250	III 50-100	IV 25-50	V 10-25	VI under 10	Total
Murder and Non-Negligent Manslaughter	4.44	5.36	5.38	3.42	2.79	3.11	4.22
Manslaughter by Negligence	3.14	3.03	3.22	2.23	1.67	1.99	2.86
Rape	8.86	5.75	6.70	4.30	5.74	5.95	7.17
Robbery	40.0	34.1	28.5	22.3	16.4	15.4	35.3
Aggravated Assault	30.1	44.8	51.4	30.5	25.8	22.5	36.9
Burglary—Breaking or Entering	278.8	207.2	253.4	224.5	186.0	158.1	245.0
Larceny—Theft	747.6	766.0	760.0	717.7	570.6	401.0	681.8
Auto Theft	155.2	158.8	138.2	126.8	95.1	71.8	135.6

The high relative frequency of larceny invites further details concerning its distribution by amounts involved. Table III shows that the bulk of all larcenies was neither in the petty

Table III.—*Relative Frequency of Larcenies 1938-41*

Value of Property Stolen	Per Cent of Total Larcenies			
	1941	1940	1939	1938
Over $50.00	11.0	10.9	11.8	13.0
$5.00 and under $50.00	65.2	65.0	64.9	65.0
Under $5.00	23.8	24.1	23.3	22.0

nor major categories, but clustered in the range between $5 and $50.

Thefts from automobiles (not including the cars themselves) constituted almost one-third of all larcenies, while bicycles were still a major object of this type of theft in 17·3% of the cases.

Burglaries in 1941 also showed certain well defined characteristics; 75·7% of them were committed at night, although here nonresidence burglaries showed a more pronounced frequency (88·2%) than in the case of burglaries committed against residences (62%). Notable, also, was the fact that more than half (52·5%) of all burglaries involved the breaking or entering of structures other than residences.

Highway robberies constituted three-fifths (59·9%) of all robberies. Oil stations were particularly singled out as objects of attack (8·5% of the total), with commercial establishments in general accounting for one-fourth (25·6%) of the general total.

Recoveries of stolen property rose in 1941 to 68%, in contrast with 1940 and 1939, when only 66·5% and 67·2%, respectively, were recovered. Hence 1941 was notable in marking the highest ratio of stolen property recoveries that had been recorded since nation-wide crime figures were available. The percentage of stolen cars recovered rose to 94·7% in 1941, constituting 96·4% of the value of the stolen cars.

World War II.—The advent of war late in 1941 aroused speculation as to its probable effect upon crime rates. During World War I, European experience indicated that criminal offenses declined, and again, following the attack on Honolulu on Dec. 7, 1941, even with its succeeding nightly blackouts, police observed a noticeable falling off in criminal complaints. Whether such phenomena are attributable to temporary changes in social attitudes, to the more rigorous police methods of a wartime society, or to the subjection of the criminally disposed elements of the population to the usual restrictions imposed by military discipline and routine, is far from clear. Some segregation of these possible factors might later be effected. (*See also* FEDERAL BUREAU OF INVESTIGATION; JUVENILE DELINQUENCY; KIDNAPPING; POLICE; SECRET SERVICE.)

(BR. S.)

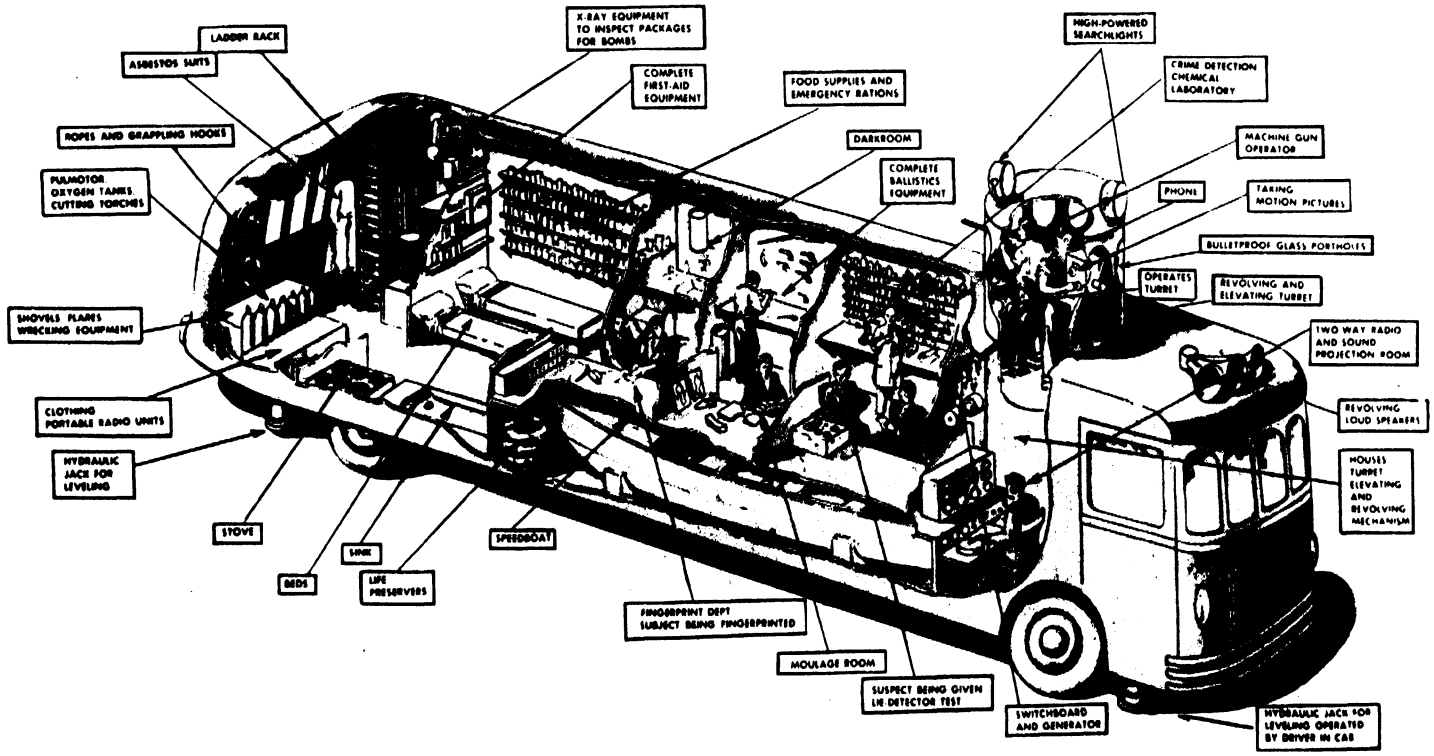
Great Britain.—No official statistics later than those for 1938 were available, but it was known that there was, except in two categories, a steady reduction in prosecutions for indictable and nonindictable offenses after the start of the war, the latest official figure showing that in its first 12 months this amounted to 12% in the age group 21 and over. Such reduction was largely attributable to the practical extinguishment of unemployment

DIAGRAM of a 29-ft. armoured crime-fighting car begun in 1941 for the Illinois state police. A speedboat, a revolving gun turret, complete crime-detection apparatus and a two-way radio station are items of equipment



(which dropped from nearly 1,500,000 to 92,350 at the end of 1941) and the absorption of men into the armed and defense services and into industry generally; while the large decrease in prosecutions for drunkenness was at least partly accounted for by the great increase in the price of spirits and the considerable decrease in the gravity of beer.

The two categories in which a rise occurred were offenses against wartime regulations and juvenile delinquency (figures not available, Jan. 1, 1942). By the end of Nov. 1941 successful prosecutions undertaken by the ministry of food alone amounted, since the start of World War II, to 34,766 out of a total of 36,972; but when it is remembered that a large number of these convictions were for such offenses as failure to display prices, supplying without correct authority and charging slightly more than the controlled price for eggs, onions or a package of candy, their value as evidence of an increase in criminality in Britain is largely discounted.

The increase in the convictions of juveniles was more serious: although here, again, too tragic a view should not be taken of it, for it was only a small proportion of the young people who had been going astray. The number of children in the age group 14-17 found guilty of indictable offenses during the first year of World War II increased by 22% as compared with 1938–39, while in the age group under 14 the increase was about 41%. This shows a worse position than that during the World War I; but whereas then the main disadvantage experienced by the children was the absence of their fathers and the consequent slackening of discipline in the home, today we must add to this the breakup of home life caused by evacuation, the nervous strain entailed by the heavy "blitzes" and more strenuous war conditions, the absorption of large numbers of mothers into industry, and, in too many cases, the weekly receipt of unaccustomedly large wage packets by the youngsters themselves. (L. H. D.)

Croatia. A newly formed kingdom in the northwestern part of the Balkan peninsula. When Yugoslavia disintegrated under the impact of German aggression at the beginning of April 1941, separatist Croats of the fascist and terrorist organization "Ustasha" set up in Zagreb an independent Croat regime with Dr. Ante Pavelitch as fuehrer or Poglavnik, and with General Sladko Kvaternik as minister of war. Education and propaganda were in the hands of Mile Budak. The Croatian Peasant party which represented under Dr. Matchek the large majority of the Croat people was excluded from a share in the government, and Dr. Matchek himself went into retirement. The new state was quickly recognized by the axis powers. It assumed immediately all the features of a fascist authoritarian regime, and excelled by the special ruthlessness and cruelty with which the small Jewish population and the large Serb minority were persecuted and partly exterminated. On May 15 the restoration of a monarchy in Croatia which had become extinct in 1089 A.D. was officially announced in Rome. The Crown of Zvonimir, the last Croatian king, was now offered to the Italian Prince Aimone, duke of Spoleto, who became King Aimone I on May 17 without, however, having dared to enter his new kingdom by the end of 1941. Long-lasting negotiations about Croatia's frontiers were not yet definitely settled by the end of 1941. The frontier with Germany corresponded generally to the frontier as it existed in 1918 between Austrian Styria and Carinthia on the one hand and the then Croatia on the other hand. While this frontier remained more or less stable, the Italian-Croatian frontier underwent several changes, because Italy wished to include large parts of Dalmatia, which is entirely inhabited by Croats, within her own empire. On May 18 an agreement was signed between Italy and Croatia according to which the larger part of Dalmatia, including the cities Zara, Sebenico and Spalato, the Bay of Cattaro and most of the islands, were ceded to Italy. Croatia promised the complete demilitarization of its small Adriatic zone, while Italy guaranteed the existence and independence of Croatia. Military and economic missions, sent to Croatia, were to enforce Italian control over the independent country. Count Giuseppe Volpi di Misurata, a well known Italian industrialist, was named head of a "permanent mission for Italian-Croat economic collaboration." On June 15 Croatia joined officially the axis alliance at a ceremony in Venice, giving its full adherence to the principles of Italy, Germany and Japan and to the "new order." According to official information released June 18, Croatia had then an area of 115,135 sq.km. with 7,080,000 inhabitants, of whom 5,200,000 were Catholic Croats. The new monetary unit was the kuna of 100 banica, one kuna equalling 0.017921 gram of fine gold. The young kingdom was subject to violent disorders and revolts, and Italian forces frequently had to interfere. On Aug. 23 Italian armies took over complete control of Croatia's entire coastal zone from Fiume to Montenegro to insure "public safety." The lawlessness and cruelties of the "Ustasha" were so great that the Croat government was forced to reorganize it completely. By the end of 1941 Croatia seethed with discontent, relations between Croats and Italians were strained to the utmost, and between Croats and Serbs open and bitter hostilities had been aroused, so that the independence of the kingdom and even its existence were as doubtful as the whole "new order." (*See* also DALMATIA; MONTENEGRO; YUGOSLAVIA.)

(H. Ko.)

Crop Insurance. With the U.S. winter wheat crop planted in the fall of 1941, the Federal Crop Insurance corporation adopted a new plan for the payment of premiums on insurance of the 1942 crops of wheat and cotton. Farmers insuring 1942 crops were to pay the insurance premium with a commodity note instead of with wheat or cotton or the cash equivalent, as heretofore. By this arrangement the Crop Insurance corporation expected to increase the number of farmers who insure crops and also effect a saving of $1,000,000 annually in the corporation's expense of storing and handling grain. The commodity note, which is a part of the crop insurance application, promises to pay in wheat or cotton or the cash equivalent at maturity. Maturity dates vary in different localities and coincide with the time of harvest and the receiving of AAA payments by farmers. If a farmer fails to pay on time the premium will be deducted from any indemnity due him or from his first government payment. In 1941, it was reported, 95% of all crop insurance premiums was paid through assignment of farmers' AAA payments. The Crop Insurance corporation issued 420,000 contracts on the 1941 harvests. Under the new plan of premium payments the corporation expected to carry very little wheat. Heretofore it carried from 6,680,000 bu. to 14,300,000 bu. Under the new plan a farmer who operates more than one farm in a county or who has an interest in wheat growing on more than one farm cannot, as heretofore, insure only the high-risk crop and elect not to insure a low-risk area.

He must insure all such crops that are in the same county. Applications for insurance on winter wheat must be made before seeding and no later than Aug. 30; on spring wheat, no later than Feb. 28. But, under the new plan, the grower does not have to state the acreage at that time. He may specify the acreage insured later, when he is more certain as to the acreage he may wish to plant. (S. O. R.)

Crushed Stone: *see* STONE.

Cryolite. After the occupation of Denmark by Germany, and of Greenland by the United States, there was little information available on cryolite, aside from the imports into the United States, which more than doubled in 1940, reaching 25,858 long tons, the largest figure on record by a large margin. Since the 1939 output was expected to be 55,000 metric tons, there was still a large balance left after deducting the United States shipments, but nothing was known as to its distribution. Presumably the aluminum industries of Canada and England were being supplied by direct shipments. Since it had been the practice of the former Danish distributors to maintain stocks of some magnitude, it is probable that these fell into German hands. (G. A. Ro.)

Csaky, Stephen, Count (1897–1941), Hungarian statesman and diplomat, was born in Segesvar, Hungary. The youngest foreign minister in Hungary's history, he spent nearly half his life in the foreign service. He embarked upon a diplomatic career in 1921, when he was appointed secretary at the Hungarian embassy in Rome. Three years later he was transferred to the Bucharest embassy, and subsequently held the post of chargé d'affaires in Madrid and Lisbon. In 1934 he was appointed minister to Spain and in 1938 became foreign minister. Csáky, an ardent revisionist, sought the return of territories wrested from Hungary after World War I, and shaped his foreign policy to that end. Convinced that the axis powers were destined to dominate Europe, he voiced vigorous approval of their policies and in return was rewarded in Aug. 1940, when Germany and Italy compelled Rumania to cede half of Transylvania to Hungary. In Nov. 1940 he signed the Rome-Berlin-Tokyo pact and shortly before his death he concluded a treaty of "perpetual friendship" with Yugoslavia. He died in Budapest, Jan. 27.

Cuba. A republic occupying the largest of the West Indian islands; area, 41,634 sq.mi., excluding small neighbouring islands; pop. (unofficial 1941 est.): 4,420,707 (Dec. 31, 1938 official est.: 4,227,597), of whom 68% are white. Capital, Havana, 1938 pop. 568,913. Other principal cities are Camaguey (138,295); Santiago (107,125); Santa Clara (99,509); Marianao (suburb of Havana) (86,435); Cienfuegos (92,258). (Population figures are for municipalities, which usually embrace considerably larger areas than do conventional Anglo-Saxon cities.) The United States has a leased naval base at Guantánamo bay, in eastern Cuba. President, Fulgencio Batista.

History.—Cuba is under constitutional government, with a regularly elected president and a bicameral congress. President Batista, inaugurated in Oct. 1940, successfully weathered, in early 1941, the first contest of his presidential authority, and a short-lived crisis ended without bloodshed. Long-standing friction between the president and high-ranking military leaders, notably Colonel Pedraza, chief of staff of the army, and Colonel Ángel A. González, chief of staff of the navy, reached a climax on Feb. 3, after Pedraza had demanded Batista's virtual abdication. Accepting the challenge, Batista assumed full control of the country's armed forces and, suspending constitutional guarantees, arrested both Pedraza and González and exiled them. The suspended guarantees were restored two days later.

A more serious threat to the presidential will was the continuing congressional criticism and obstruction. First evidence was the refusal of congress to pass the 1941 budget, necessitating extension of the 1940 budget. More extensive was the criticism levelled at the government because of its alleged failure to take adequate measures against profascist elements in Cuba. Centre of this controversy was Genaro Riestra, Spanish consul general, who had earlier been expelled from Mexico on charges of disseminating totalitarian propaganda and was reputed to be the Cuban head of the pro-axis Spanish *Falange*. Subsequently, Riestra was declared *persona non grata* and was asked to leave the country. Similarly, the Spanish commercial attaché was expelled. Francisco Álvarez García, a local leader of the *Falange*, was taken into custody with two others and was charged with antidemocratic activities. Acquittal was won, however, because of insufficient evidence.

Opposition to the axis, following the lead of the United States, was widespread, and Cuba indicated a sincere desire to cast its lot with the United States. In Jan. 1941 Pres. Batista issued a decree designed to curb totalitarian propaganda in Cuba; on Feb. 13 the *Falange* was ordered to close its soup kitchens and welfare agencies, and, three days later, all German and Italian consular officials were ordered to leave the country before Aug. 25. Indicative of strong anti-fascism was the bombing, on Aug. 18, of several Spanish-owned shops, when 12 persons were seriously injured.

Domestic strife in Cuba evinced itself in factional disputes in congress, and in disputes between congress and the president and his cabinet. Obstructionist tactics among opposition congressmen prevented consideration, before the regular session of congress ended May 27, of a number of measures the administration deemed urgent. Pres. Batista therefore called a special session of congress which began, on July 14, to consider tax reforms made urgent by a serious budgetary deficit, and to authorize negotiation of a $25,000,000 loan from the United States Export-Import bank. Meanwhile, congressional opposition arising from patronage disputes led to a shuffling of Batista's cabinet personnel. The new cabinet was top-heavy with 11 old and 7 new members. Its creation failed to quiet the opposition and, on Aug. 4, obstructionist tactics led to a brawl on the senate floor involving some 20 persons. Despite a continuing crisis, the special session approved a general increase of 20% in all taxes before it disbanded. The next regular session, convening Sept. 17, moved to consider approval of the Export-Import bank loan, and on Nov. 21 a law authorizing negotiations for such a loan received presidential approval. Proceeds of the loan were allotted for highway repair and construction and for an agricultural program aimed at diversification and improvement of irrigation facilities.

As a result of a rising cost of living, labour problems were serious in 1941. Early in the year, the opening of the grinding season for sugar was endangered by the strike threat. Labourers insisted that the wage scale established in 1940 should be extended, while growers desired a lower scale. This first controversy was solved by Pres. Batista, who pegged wages at the previous level but provided for a downward scaling of wages, should sugar prices decline. Strikes spread to other industries in the country and, in October, 700 employees of wholesale food and liquor companies walked out when their demands for increased wages were refused. The entire problem of wages in the island came to a head in November, when labourers refused to work in the sugar mills unless they were granted wage increases. Once again Batista intervened, and by decree granted a blanket wage increase of from 10% to 25%.

Throughout the year, relations with the United States continued close, and in November a "lend-lease" agreement was concluded.

ARMY AND POLICE OFFICIALS of Cuba arriving with their families at Miami, Fla. Feb. 4, 1941 after President Batista had exiled them for alleged sedition

Details were not made public but were understood to provide for considerable defense materials to Cuba, with repayment presumably in sugar, tobacco, manganese and other Cuban products. Upon declaration of war against the axis powers by the United States in December, Cuba immediately followed with similar declarations.

Education.—Education is under national control. There were, in 1941, nearly 5,000 primary schools, with close to 500,000 enrolment. The 1942 budget allotted $16,308,000 to education, 18.1% of the total.

Defense.—Cuba has a peacetime army of 8,000, a rural guard of 6,000, and 48,000 reserves. During 1941, steps were taken to increase greatly the military establishment. The navy comprised two vessels in 1941. The 1942 budget provided $15,794,000 for national defense.

Finance.—The monetary unit is the peso, theoretically equal in value to the U.S. dollar. In 1940, the exchange rate averaged approximately 90 cents U.S., but during 1941 it gradually improved, reaching par in September. The 1942 budget anticipated revenues of $89,960,000 and expenditures of $89,956,000. Nearly a third of the national revenues was expected from customs duties, and a third from excise taxes. The 1941 budget, as subsequently adjusted, provided for $78,742,000. Actual revenues to Oct. 25 were $61,703,000, and a deficit of less than $3,000,000 was forecast. The national debt in 1940 was $135,905,000, of which $107,261,000 was external. The 1942 budget allotted $10,786,000 for public debt service.

Communication.—Cuba has numerous good ports, the most important being Havana and Santiago. Regular and frequent external steamer communication is maintained, with daily service from Key West, Fla. Havana is on the main route of the Pan American airways. International air traffic through the country continued to increase in 1941. Both passengers and express increased markedly, by 25% and 32% respectively, although mail volume decreased by 4%. Internal air transport facilities are excellent. Land communication is by a 3,850-mi. railway system (including 250 mi. electric), based on an east-west trunk line, and by a network of 2,500 mi. of improved highways, principal of which is the 706-mi. Central highway from Havana to Santiago. In mid-1941, motor vehicle registration was 48,324, including 29,323 passenger cars, 3,079 buses and 15,496 trucks. Telephone and telegraph facilities (52,740 telephones and 10,939 mi. of telegraph lines in 1939) are superior to those of any other western hemisphere country except the United States and Canada. There were 54 radio broadcasting stations in 1941.

Trade and Production.—Cuba's imports comprise chiefly foodstuffs, machinery and miscellaneous manufactured goods. In 1940 imports declined nominally to $103,860,000 (1939: $105,862,000), with the United States supplying 78%, Great Britain 34%, British India 2.9% (largely jute bags) and Curaçao 2.1% (petroleum). Imports during the first eight months of 1941 were 16.8% greater, with the United States providing most of the additional values.

Exports totalled $127,288,000 in 1940 (1939: $147,676,000), the lowest since 1934, 82.4% to the United States (1939: 75.3%), 7.8% to Great Britain (1939: 12.2%). In the first nine months of 1941, export values increased 47%, of which a considerable part represented British purchases of sugar and molasses.

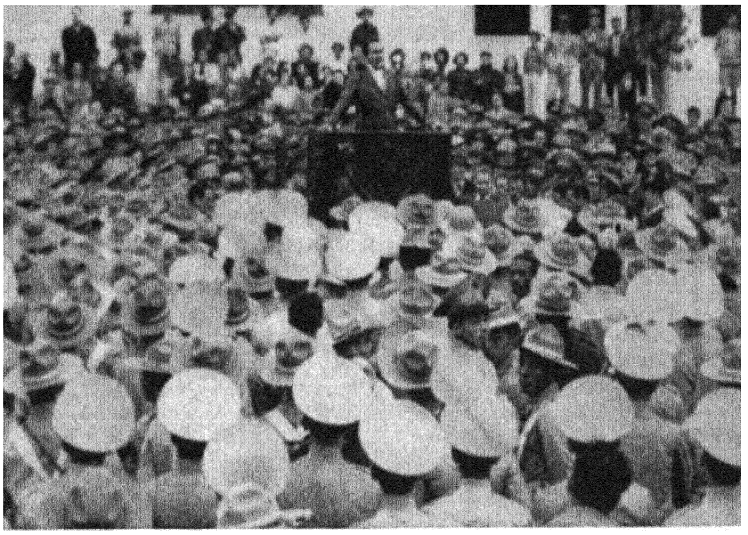
Sugar and sugar products aggregated 66.5% of all exports in 1940, against a normal of nearly 90%, with a volume (1,989,192 tons, 1,485,824 tons to the United States) 31% less than in 1938, and 26% less than in 1939. Sugar exports increased 29% in the first nine months of 1941, and stocks on hand fell to 100,000 tons by September. This situation, coupled with an 86% better price, put the Cuban sugar industry in its best position for a decade, and permitted the retirement of most of a United States Export-Import bank loan made in January to cover grinding of an apparent sugar surplus of 400,000 tons. During the year United States sugar quotas for Cuba were raised five times, reaching the highest allotment figure ever attained under the quota system. A price ceiling of 3½ cents, imposed by the United States Office of Price Control, caused vigorous protest, however. Claims were made that duty and freight charges took almost 1½ cents a pound, and a drive was instituted to reduce the United States import duty on that commodity. In November a five-man commission left Havana to negotiate with Washington officials concerning United States plans to buy Cuba's entire 1942 production of sugar, which, it was estimated, would reach a total of 4,000,000 tons. Although such an arrangement would help stabilize the island's economy, many Cuban growers and grinders, foreseeing steadily rising prices on the open market, disapproved the plan.

Other agricultural export commodities include tobacco, fresh fruits (avocados, grapefruit, bananas, pineapples and papayas). Most of Cuba's tobacco goes to the United States, with Spain second.

Mineral Production.—The total mineral output was valued at $11,700,000 in 1940. The leading mineral product is manganese, in which Cuba ranks second to Brazil in Latin America. During the first half of 1941 exports almost doubled. Chromite is also important. Barite ore, copper, iron and gold ore are also exported in small quantities.

Tourist Trade.—The tourist trade, an important Cuban economic asset, declined in 1940, with 127,464 tourists (6% less than in 1939), entering the country. The first four months of 1941, however, showed a recovery. (*See* also WEST INDIES.) (L. W. BE.; L. C. DE A.)

Cudahy, Edward Aloysius, Sr. (1860–1941), U.S. meat packer, was born Feb. 1 in Milwaukee, Wis. He started work in a meat-packing plant at 12 and rose to the position of general manager of Armour's Omaha plant, which became known in 1877 as the Armour-Cudahy company. With his older brother, he bought out the Armour interests in 1890. He took the post of vice-president in the new company and in 1910 he was made president. Cudahy became chairman of the board in 1926 and maintained an active interest in the company. He died in Chicago, Oct. 18.



PRESIDENT BATISTA of Cuba addressing soldiers of Camp Columbia Feb. 5, 1941 after ousting the chiefs of the army and police, whom he charged with sedition

Cunningham, Sir Alan Gordon (1887–), British army officer and gunnery expert, was born May 1 in England. A student at the Royal Military academy, Woolwich, he won his commission in 1906 and saw action in World War I in the field and as a general staff officer. After serving as a general staff officer in the Straits Settlements, 1919–21, he returned to England to specialize in machine-gun and heavy artillery problems. In World War II, Sir Alan commanded a British army in Kenya. Assigned the task of smashing Mussolini's legions in Somaliland and Ethiopia, his armies penetrated Italian Somaliland in Feb. 1941 and took Mogadishu, the capital. After a 1,500-mi. drive through African deserts and jungles, his armies entered Addis Ababa April 6, 1941. Sir Alan was then named commander of the British 8th army in Egypt and Libya and, collaborating with British Mediterranean warships commanded by his brother, Sir Andrew Browne Cunningham (*q.v.*), he launched a surprise offensive Nov. 18, 1941, against axis armies in Libya. This offensive started brilliantly, but was slowed by axis counterdrives and on Nov. 26 Sir Alan, who was reportedly suffering from serious overstrain, was granted sick leave and replaced by Major General Neil Methuen Ritchie (*q.v.*).

Cunningham, Sir Andrew Browne (1883–), British naval officer, commander of the British Mediterranean fleet after 1939, was born in Bishop's Waltham, Hants., England. He entered the royal navy in 1898. During World War I, Sir Andrew commanded the destroyer "Scorpion" and staged daring raids against enemy shipping in the Mediterranean. He was a rear admiral in 1933–36, and was made a vice-admiral commanding a battle cruiser squadron in 1937. He was also lord commissioner of the admiralty and deputy chief of the naval staff, 1938–39. In April 1940 Sir Andrew, aboard his flagship "Warspite," led a destroyer flotilla into Narvik fjord and sank seven German destroyers. Except for the Narvik battle, he had most of his naval experience in the Mediterranean, of which he is said to know every bay and inlet. In Nov. 1940 Sir Andrew's fleet raided the Italian naval base at Taranto, and crippled three Italian battleships. He commanded the victorious British fleet at the battle of Cape Matapan March 28, 1941. On Nov. 18, 1941, he teamed up with his brother, Sir Alan Gordon Cunningham (*q.v.*), commander of the British 8th army, to launch a combined land, air and sea drive against axis units in Libya.

Curaçao, a Netherlands colony in the Caribbean, including Curaçao, Aruba and Bonaire islands in the Leeward group, off the coast of Venezuela, and Saba, St. Eustatius and the

southern part of St. Martins in the Windwards. The colony's area is 436 sq.mi. (Curaçao, 210 sq.mi.; Bonaire, 95 sq.mi.; Aruba, 69 sq.mi.; St. Martins, 17 sq.mi.; St. Eustatius, 7 sq.mi.; Saba, 5 sq.mi.). Population: 101,021 (1938 official est.), mostly on Curaçao (62,798) and Aruba (28,155). Religion: predominantly Roman Catholic; language: officially Dutch. Capital: Willemstad, on Curaçao, pop. 30,453. Government is in the hands of an appointed governor and a council, a majority of which is elected. Governor: G. J. J. Wouters.

History.—Wartime activity continued to dominate the scene in Curaçao throughout 1941, with the expansion of already extensive petroleum refining facilities and adjustment to the transfer to Willemstad, in 1940, of the general headquarters of the Royal Dutch Shell company. Building construction was especially active, with one of the more notable projects a 600-ft. ship drydock. Defenses, including air-raid shelters, were steadily extended as handling of petroleum for war needs made Willemstad one of the busiest war ports in the world.

Education.—There were 49 schools, with 11,044 pupils, in 1938.

Finance.—The monetary unit is the guilder, valued at 52½ cents U.S. in 1941.

Trade and Industry.—Refining of crude petroleum (chiefly from Venezuela) on Curaçao and Aruba, where two of the world's three largest refineries are located, dominates the colony's economy, and accounts in peacetime for a full 99% of all export values. One single refinery employs some 5,000 persons.

No statistics of petroleum refining or trade are made public in wartime. Total United States-Curaçao trade figures are, however, available. In 1938 the value of Curaçao's total trade was: exports, 340,545,295 guilders; imports (80% petroleum), 391,130,826 guilders. Some 75% of all imports come formally from Venezuela, most of the remainder from Colombia, with miscellaneous goods supplied by the Netherlands (to May 1940) and the United States. In 1940 imports other than petroleum totalled $25,088,000 (1939: $27,062,000), 67% from the United States (1939: 63%); exports other than petroleum products $9,445,000 (1939: $8,981,000). All imports from the United States were valued at $21,682,661 (1939: $38,378,314); all exports to the United States $19,517,346 (1939: $19,722,938). During the first eight months of 1941 imports of United States origin totalled $9,949,668; a 37.6% decline, while exports to the United States were valued at $29,015,397, a 91.8% increase.

The principal resource of domestic origin in the larger islands is phosphate; Saba and the other islands in the Windward group are of almost no consequence economically, producing small quantities of fancy textiles and miscellaneous agricultural products.

Communication.—External and interisland communication is by steamer. Curaçao itself and Aruba have frequent air service. Normally an average of more than 41 ships daily clear from ports of the colony, with the total greatly enlarged under war conditions, because of refuelling facilities. (*See* also HISPANIC AMERICA AND WORLD WAR II; WEST INDIES.) (L. W. BE.)

Curling. The successful defense of the Gordon International medal by Canadian curlers was the chief development during the 1941 season. The dominion's rinkmen won 13 of the 19 matches with the U.S. curlers, scoring 272 to 210. R. H. MacNabb of Ottawa, Ont. and E. Hamel of Three Rivers, Ont. set the pace for the Canadian rinks. The Gordon Grand National and the Richard S. Emmet Memorial medals went to the Schenectady Curling club, on whose ice the tournaments were held. The rink skipped by R. D. Thomson gained its third consecutive Gordon title by downing Mahopac in 16 ends.

The Ardsley, N.Y. rink, skipped by George B. Ogden, won the Allen medal, defeating the Utica (N.Y.) rink, skipped by Robert Davies, retiring Grand National president. Campbell Patterson's Country Club rink from Brookline, Mass., won the Country Club cup. (J. B. P.)

Currency: *see* COINAGE.

Curtin, John (1885–), Australian statesman, born Jan. 8 at Creswick, Victoria, Australia. Educated in the state schools, Curtin later became actively engaged in politics and labour journalism. As general secretary of the Victorian Timber Workers' union, 1911–15, and editor of the *Westralian Worker,* 1917–28, he became an exponent of the Australian Labour party's dual traditions of nationalism and theoretical socialism. During World War I, he was secretary of the anti-conscription campaign. In 1924 Curtin was a delegate to the International Labour conference; in 1927–28, a member of the Commonwealth royal commission on family allowance; in 1929–31, a member of the joint committee on public works; and in 1931–34, state advocate for Western Australia to the Commonwealth Grants commission. He was also a member of the Australian house of representatives, serving from 1928 to 1931, and again from 1934 to 1941. During the latter period he was leader of the Federal Labour party and the parliamentary opposition. He succeeded Arthur Fadden (*q.v.*) as prime minister of Australia Oct. 3, 1941. Curtin, in a message sent Dec. 24, 1941 to the Roosevelt-Churchill war parleys in Washington, blamed Allied reverses in the far east on the Anglo-U.S. tendency to underestimate the power of the Japanese air force. On Dec. 27, 1941, he further declared that Australia relied chiefly on the United States in the war against Japan.

Cycling. For the second consecutive year there was no six-day bicycle race held in New York, although this event was one of the internationally famous cycling classics annually for many years previous. The reason for the cancellation was the fact that the majority of the riders were of foreign birth and were occupied in matters of war in their native countries.

There was no competition for world titles for the same reason. In the United States three governing bodies staged title events—the Amateur Bicycle League of America, the National Cycling association and the Century Road Club of America.

The N.C.A. sprint championship was won by Tom Saetta of Brooklyn, while Mike DeFilipo of Newark won the paced title. The A.B.L. senior road championship was won by Marvin Thomson of Chicago, and the junior title went to Andrew Bernadsky of San Francisco. The girls' champion was Jean Michels of Chicago.

The track championships of the A.B.L. were won by Bob Stauffacher of San Francisco who triumphed in the senior class, and Chuck Edwards of Chicago winner among the juniors. Stauffacher also captured the Century Road club's senior title.

The A.B.L. of America selected an all-American cycling group as shown in the table.

Name	*City*	*Points*
George Hurlburt, Jr.	Buffalo	275
Furman Kugler	Somerville, N.J.	195
Jerry Kandler	Milwaukee	190
Iggy Gronkowski, Jr.	Buffalo	115
George Woof	San Francisco	98
Johnny Weber	Milwaukee	85
James Dolle	Irvington, Ind.	84
Isamer Fiyuyama	Honolulu	79
George Edge	Philadelphia	74
Harry Naismyth	Somerville, N.J.	67
Bruce Burgess	Irvington, Ind.	65
Francis DeCabe	Honolulu	64

There was an international bike race over the Inter-American highway from Tegucigalpa, Honduras, to Guatemala City. The Guatemala team won with Fraterno Vila, 18-year-old star, pedalling at the rate of 15 m.p.h. Tommy Hayes of Dallas, Texas won the seventh annual national 100-mi. motorcycling championship, winning in the amazing time of 1:15:46.51.

The six-day bike race which was held in Montreal, Canada, was won by the team of Angelo DeBacco of Newark, N.J., and Rene Cyr of Montreal. Second place was taken by the popular team of Jules Audy of Montreal and Cecil Yates of Chicago. (T. J. D.)

Czechoslovakia. Formerly a republic in Central Europe, dismembered in 1938–39 as a result of German aggression. The largest part of Czechoslovakia passed under German administration, either as an integral part of Germany like the Sudetenland or as a "protectorate" (*see* Bo-

HEMIA AND MORAVIA). A smaller eastern part became part of Hungary (*see* RUTHENIA), and the part inhabited mainly by Slovaks was established as a nominally independent state in alliance with Germany (*see* SLOVAKIA). The area of Czechoslovakia had been 54,244 sq.mi. with a population of 14,729,536, census Dec. 1930.

History.—In spite of dismemberment the Czechoslovaks continued to hope and to work for their national resurrection; the war strengthened their expectation that Czechoslovak democracy and independence would be restored. The ruthless oppression in Czechoslovakia and the many executions and reprisals only strengthened this will. On July 24, 1940, a provisional Czechoslovak government was formed in London under Dr. Eduard Beneš as president and was officially recognized by the British government as the legitimate government of Czechoslovakia. After the outbreak of the war with the soviet union, the soviet government as well as the British government recognized full governmental status for what had been only the "provisional" Czechoslovak government. Prime minister in 1941 was Monsignor Jan Šrámek, leader of the Catholic party amongst the Czechs; foreign minister was Jan Masaryk, and among the members of the cabinet there were both Czechs and Slovaks. A "national committee" was formed to prepare drafts for legislation, under R. Běchyne, a Social Democrat, as speaker and Milan Hodža, a right-wing Agrarian, as deputy-speaker.

On Oct. 27, 1941, Jaromir Nečas was appointed minister of reconstruction and public works.

Meanwhile the underground struggle was carried on throughout former Czechoslovakia in contact with the government established in London. Underground papers, like *V Boj*, found a wide circulation, and on Sept. 12 a secret Czechoslovak National Revolutionary committee was organized and started a movement to boycott the German-controlled press, thus reducing considerably the sale of newspapers.

The Czech workers in the important armament factories applied the "go slow" tactics. A number of train wreckages was reported. While new German schools were opened throughout all the former Czechoslovakia the number of Czech schools, especially of Czech high schools, was severely curtailed, hundreds of elementary schools were closed, and only slightly more than a third of Czech children finishing elementary schools were allowed to enter high schools.

The Czechoslovak government meanwhile laid the foundations for building up a new postwar order in the Danubian basin which would assure liberty, equality and security to all the peoples living there. The beginning was made by an understanding with Poland about future Polish-Czechoslovak co-operation, which was the more remarkable because the hostile attitude of Poland to Czechoslovakia in the 20 years preceding World War II facilitated the German conquests of both countries. In Feb. 1941 representatives from both sides were appointed to co-ordinate all political, legal, economic, financial, defense and cultural activities. On Nov. 3, 1941 the delegations of Czechoslovakia, Poland, Yugoslavia and Greece to the conference of the International Labour organization in New York city made public a joint declaration announcing the formation of the bloc of the four nations to serve as the basis for a larger confederation of peoples from the Baltic to the Aegean after the war. This confederation would embrace a population of 100,000,000 for common political, economic and social objectives. Jan Masaryk, the Czechoslovak foreign minister, declared that this plan showed clearly that the Central European and Balkan countries realized the importance of starting to prepare for a better future.

D'Abernon, Edgar Vincent, 1ST VISCOUNT (1857–1941), British diplomat, was born Aug. 19 at Slinfold, Sussex, England and was educated at Eton. While ambassador to Germany, 1920–26, he advised President Hindenburg on economic and financial policy. He bitterly opposed the postwar policy of saddling Germany with reparations and was deeply distrustful of Allied statesmen in their efforts to refashion Europe at conference table parleys. Viscount D'Abernon headed the economic mission to Argentina and Brazil, 1929, and he was chairman of the Medical Research council, 1929–33. Among his works are: *A Grammar of Modern Greek* (1881); *An Ambassador of Peace* (3 vols., 1929–31); *The Eighteenth Decisive Battle of the World* (1931); *The Economic Crisis—Its Causes and The Cure* (1931) and *Portraits and Appreciations* (1931). Viscount D'Abernon died at Hove, Sussex, Nov. 1. (See *Encyclopædia Britannica.*)

Dahomey: *see* FRENCH COLONIAL EMPIRE.

Dairying. The U.S. production of milk and practically all dairy products (with the possible exception of butter) was higher in 1941 than in 1940; it also exceeded the ten-year (1930–39) average. On Sept. 25, 1941, Claude R. Wickard, secretary of agriculture, asked that production of milk and cheese be still further increased in order to assure adequate supplies to Britain, under the provisions of the lend-lease act. To help accomplish increased production, the government announced that arrangements would be made with the Supply Priorities and Allocations board for sufficient equipment to provide for modest expansion in cheese and evaporated milk co-operatives approved by the agricultural marketing administrator. A similar arrangement would also be made to aid privately owned plants.

A number of plants that ordinarily manufacture only butter, or chiefly butter, also began manufacturing cheese or evaporated and dried milk in 1941 to help meet the government's increasing demand for these products. On Aug. 31, 1941, Secretary Wickard said $1,000,000,000 would be required for purchases of food for Britain from that date to Feb. 28, 1942; of that amount one-third was for dairy and poultry products. About 200,000 long tons of lend-lease food per month was being shipped to Britain, he said. Previous to Aug. 31, a total of about 420,000 long tons had been shipped. (For production and shipping details *see* BUTTER; CHEESE; MILK.)

The department of agriculture estimated that the number of cows on U.S. farms would be nearly 26,000,000 in 1942. During 1941, milk production per cow was the largest on record. Rising prices for milk and a favourable feed ratio induced farmers to feed more heavily and also to retain in milking herds low producers that ordinarily would have been culled. Since butter production in 1941 did not follow its normal annual increase but remained practically stationary, and since the big demand was for cheese and for evaporated and dried milk, milk was largely diverted from the usual channels to cheese factories and condenseries. This diversion, however, was spotty and was heaviest in east north central states, where creamery butter production in the week ending Dec. 4, 1941, for example, was 12% below the same week in 1940. In the west north central states, where condenseries and cheese factories have capacity for only a small part of the milk produced, butter production was 1% above the same week in 1940. Many farms, however, could not divert milk from butter production because their practical operations are based on selling butter fat and retaining the skimmed milk to feed to pigs, calves and chickens. The production of farm-made butter was expected to continue the steady decline that set in some years ago. (S. O. R.)

Dakar. A Vichy French port of enormous strategic importance, Dakar is the capital of French West Africa (Pierre Boisson, governor general). The town is situated in 14°40′ N., 17°24′ W., on the eastern side of the peninsula of Cape Verde, the westernmost point of Africa. It is only 1,620 nautical miles from Natal, Brazil, and is the African terminus for the German and Italian air lines to South America. The population prior to World War I was 33,673, of whom 2,939 were Europeans. Estimates of its population in 1941 varied widely, some saying that it had 75,000 inhabitants, of whom 10,000 were Europeans. The climate is very hot, but the town has a good water supply. Dakar is also the seat of a bishopric and is connected by railway to St. Louis, Senegal, distant 130 mi. The French government continuously improved the naval fortifications and facilities at Dakar in 1941, and 128,000,000 francs were allocated Sept. 4, 1941 for this purpose and for the completion of the trans-Saharan railroad.

On Sept. 23–25, 1940, an amphibian battle was fought at Dakar. The British and Free French had two battleships, four cruisers, six destroyers, and several transports, carrying a force of 8,000–10,000 men. The expedition finally sailed away, just when, it is said, Dakar was on the point of surrender.

The harbour, the best between Casablanca, Morocco, and the Cape of Good Hope, is formed by two jetties, 6,840 and 1,968 ft. long, respectively. The entrance to the harbour is 720 ft. wide. The inside harbour was dredged to a depth of 33 ft. in 1936. There is a drydock 656 ft. long by 92 ft. broad, which will accommodate vessels of 10,000 tons. There is also a naval arsenal, and a torpedo-boat basin. During 1941, covering fortresses on Cap Manuel and the isle of Gorée were much strengthened, and the garrison at Dakar was re-enforced.

There were continuous rumours in 1940–41 that Dakar was being used by Germany as a submarine base, and that German technicians and "tourists" were there, but these allegations were consistently and emphatically denied by the Vichy French authorities. On May 15, 1941, President Roosevelt stated that the German use of French West African bases would create a menace for the new world, and in his fireside chat of May 27 he said that the nazi "threat extends . . . also to the Atlantic fortress of Dakar. . . ."

Dalmatia. A former Yugoslav province on the northeastern shore of the Adriatic sea, inhabited by Croats, Dalmatia came under Italian control as a result of Yugoslavia's collapse under German aggression in April 1941. On May 20 Dalmatia, divided into the three provinces of Zara, Split and Cattaro, became an Italian province under Giuseppe Bastianini, former Italian ambassador to London, whose residence was to be in Zara. Some Dalmatian islands were incorporated into the Italian province of Fiume. By this acquisition Italy gained important ports, of which Cattaro and Sebenico represented excellent naval bases. According to the original agreement of May 18 between Croatia and Italy, certain parts of the Dalmatian coast with Ragusa as the most important city remained under Croatia, but in August the whole Dalmatian territory was occupied, from Fiume in the north to Montenegro in the south, by the Italian army, and the whole system of communications, railroads, telegraph and telephone, was put under military control. For the Croatian territories a Croatian civilian commissar was named with the rank of a minister, to assist the Italian military commander. But the Croatian population of Dalmatia did not acquiesce in the Italian occupation of the land. Many Italian soldiers were killed and wounded in guerrilla attacks, and the Italians started reprisals by executions and even by the seizure of hostages, though on the whole the Italian regime was milder than the similar German and Croat regimes of other parts of former Yugoslavia. With practically the whole Dalmatian coast in Italian hands, only one outlet to the Adriatic sea was left to Croatia, at Ragusa or Dubrovnik. The Italians, who had tried in vain to acquire Dalmatia after World War I because Woodrow Wilson did not wish to abandon this purely Slavonic land to Italy's domination, had thus come into the possession of a strategically important "fifth shore" to which they claimed historic connections from the time of the Roman empire and of the Venetian republic. (*See* also CROATIA; MONTENEGRO; YUGOSLAVIA.) (H. KO.)

Dams. In 1941, throughout the world, heavy guards were placed at dams of water power and water supply developments vital to important industrial areas, while additional developments have been rushed to completion. Meanwhile, the United States continued and initiated new construction on major irrigation and flood control projects, involving the largest dams in the world. The table on p. 212 includes only 20 of the many important dams completed or under construction during 1941.

At Grand Coulee in the United States, the world's largest concrete dam was 99% complete at the close of 1941, and the reservoir was filled. Development of power by the first of the 18 world's largest (108,000-kw.) hydro-electric generators was commenced on March 22.

Shasta, second largest concrete dam, part of the great Central Valley project in California, had 2,210,000 cu.yd., or over one-third, of its concrete in place on Nov. 13. At the other major feature of this project, Friant dam, world's fourth (Boulder is third) largest concrete dam, more than 2,000,000 cu.yd. of concrete were in place, and storage of water was begun on Oct. 20.

On the North Platte river, the Kingsley earthfill dam, second largest (Fort Peck is largest) dam in the world, was dedicated on July 12.

The Stevens dam, highest earth and rock fill dam in the world, was practically complete at the close of the year. Unique in the history of dam construction were the steps taken to secure the desired moisture content for proper construction of the earthfill in the core of this dam. Because of the wet climate and the wet nature of the material in the borrow pit, particularly during the rainy season, it was necessary to pass the core material through huge revolving drums heated by 1,000-h.p. oil burners, three of these units being used, treating as much as 200 cu.yd. per hour. A huge tent, 280 ft. by 196 ft., was erected over the central section of the dam to protect the dried material from the heavy rainfall.

In the Tennessee valley, work was rushed on a number of dams to provide more power for war industries. Glenville, a 150-ft.-high earthfill dam, containing 1,300,000 cu.yd., was placed in operation on Oct. 13. The dam was built in less than a year.

Central and South America.—Irrigation projects were continuing in Central and South America. The San Felipe dam on the Conlara river, an 85-ft.-high hollow buttressed concrete structure, was completed by the Argentina national irrigation directorate. La Angostura, 291-ft.-high arch dam, first of several extensive projects of the Mexican national commission of irrigation, was completed.

Europe.—European activities stressed hydro-electric developments. In Latvia, a 50-ft.-high earth and concrete dam, 8,500 ft. long, was under construction for a 102,000-h.p. development on the Dwina river. On a number of projects known to have been started during 1938 and 1939 to develop power in Austria for transmission to German industrial centres, and scheduled for completion in 1941, it was not known what progress had been made. However, it was known that the first of seven 100,000-kva. generators, largest yet built in Europe, for the plant at the Yalu river dam being constructed on the Manchoukuo-Chosen border

Right: THE RESERVOIR of Roosevelt dam in Arizona was filled to tl overflow point in the spring of 1941 for the first time in 21 years

was completed in Germany during the year.

On Aug. 29, the Russians reported the destruction of their great dam on the Dnieper river in an effort to thwart the advance of the German armies, and prevent its use should the great power plant fall into German hands. The dam, a 110-ft.-high, 2,500-ft.-long, curved spillway of gravity section, was completed in 1932. The development was built under the supervision of engineers from the United States, and had a capacity of 746,000-hp. (*See* also AQUEDUCTS; IRRIGATION; WATER POWER.) (W. P. C.)

Dance. **Ballroom.**—Social dance trends in 1941 followed closely the turn of world events. The popularity of social dancing increased in proportion to its service as a safety valve for accumulative nervous tension and pent-up energy. Paralleling the "dance craze" of 1914–19, the rash of dance trends produced, in 1941, a diversity of motifs and styles, each stemming from some aspect of the social scene.

In 1941 Latin dances enjoyed even greater popularity than they had in the two previous years. One result of United States Good Neighbor policy in 1941 was an unprecedented rush of Americans to dancing classes for professional instruction in Latin-American dance rhythms, the Arthur Murray schools alone enrolling more than 800,000 students at 45 centres throughout the U.S.A. and at leading summer and winter resorts.

The Argentine tango fell off slightly during the year, its languid and sophisticated rhythms seemingly unsuited to the frenetic tempo of the time. The conga, of Afro-Cuban origin, sustained the popularity it had achieved in 1940, but it was considerably retailored to fit living room and crowded public dance floor limitations. Whereas the conga had risen to fame as a vigorous line dance, in 1941 it was more widely performed by separate couples, thus allowing more people on the same dancing area at one time. The one-two-three, kick, pattern was altered to a one-two-three, pause, retaining favourite "breaks" in which the separate partners might execute steps and improvisations as simple or as intricate as they wished.

The ballroom rumba, a refined version of the Cuban danzon, increased in favour. But, if any one dance could be termed the "dance of the year," the approbation must go to the Brazilian samba which soared to popularity during 1941. Like the rumba, the samba is danced by couples in a two-four step pattern with an accented musical accompaniment. Like the rumba, the samba comprises much hip and knee movement. But, where the rumba calls for a syncopated pause on the fourth beat, the samba institutes a lift of the torso, producing a sense of greater airiness and bounce, again in keeping with the tempo of the time.

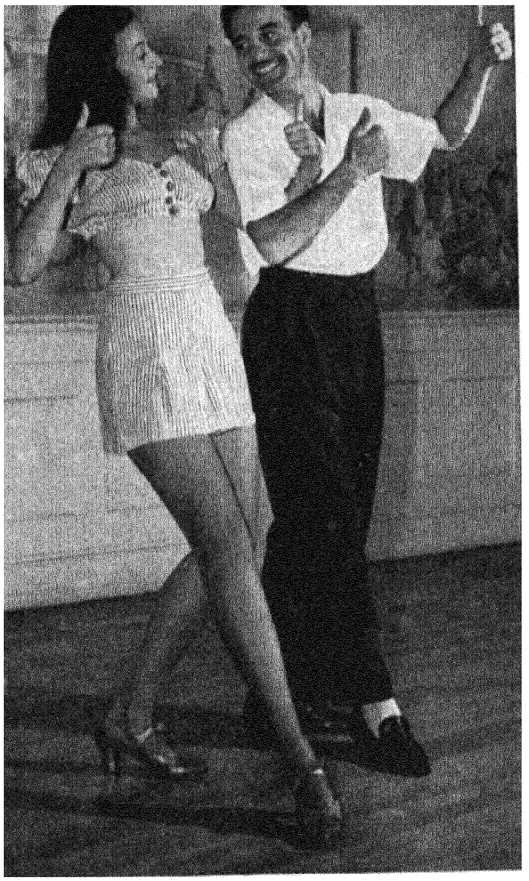
The Congeroo, a combination of jitterbug and conga, had a short-lived popularity in the east during the early months of the year. But on the whole 1941 saw the jitterbug style of dancing lose much of its abandon. The trend toward sophisticated swing music gave rise to a refined version of jitterbug dancing which was accepted at the better hotel ballrooms and sanctioned by army morale divisions and defense recreation authorities.

American folk and group dances followed an upward swing in popularity. Square and barn dancing moved in from the country and played an important role in the recreation activities of urban groups. Great numbers of square-dancing centres were established during the year and polished floors and mirrored ballrooms resounded with the callers' admonitions. Game dances, too, continued to remain part of this trend, providing new variation for such fad dances as the Big Apple.

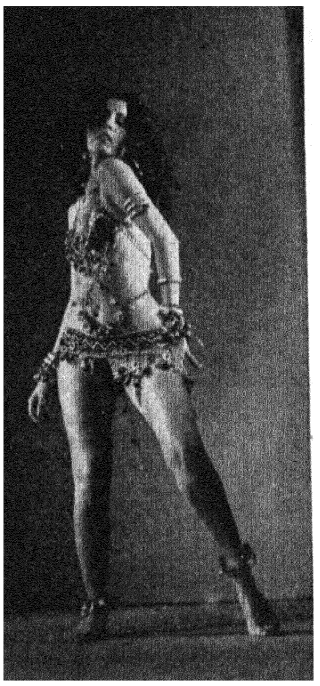
The waltz and fox trot held their customary dominance in the year of multifarious innovations. But even here, the turn of war events brought new forms. In the middle of the year the V for Victory dance was created. Couples danced the fox trot and ended the number in a group figure V. Toward the end of the year came the Thumbs Up dance. This entailed a line of open couples following a leader and swinging their arms alternately to the left and right, pointing their thumbs upward.

The close of the year witnessed the introduction of many dance novelties, the most unusual of which was the Double-Partner waltz. The decrease in the number of civilian men called for a dance which would utilize a maximum number of women for the number of available men. The Double-Partner waltz is danced by groups of three—one man and two women. (A. MU.)

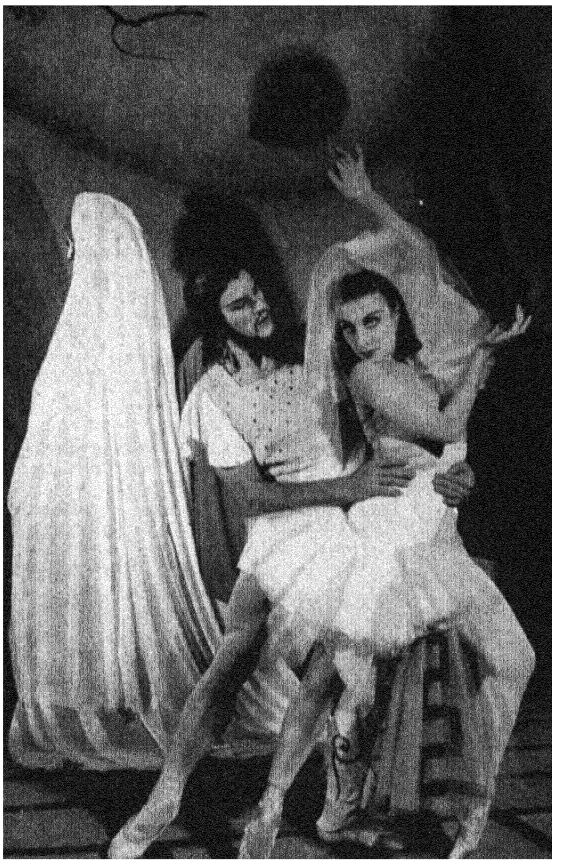
Folk Dancing.—Throughout large rural areas, in many schools and colleges and in some cities and towns, the pioneer American forms were the favourites, brought up to date by the spirit, enthusiasm and creativeness of the dancers. It was seldom called "folk" dancing but rather, according to local usage, square dancing, pioneer dancing, set-running, play-party, twistification, junket, sugar-on-the-floor, string or country dancing or quadrilles. In some cities or in areas where industry or farming caused a concentration of "nationality" peoples, especially those of the later immigration period, folk dances of other lands might predominate or be danced with equal enjoyment beside the American forms.



PROMENADE STEP from the "Defense Swing," a dance named in honour of U.S. selectees and introduced at the 1941 convention of the Dance Educators of America. It is performed to the tune of "Yankee Doodle" in swing time

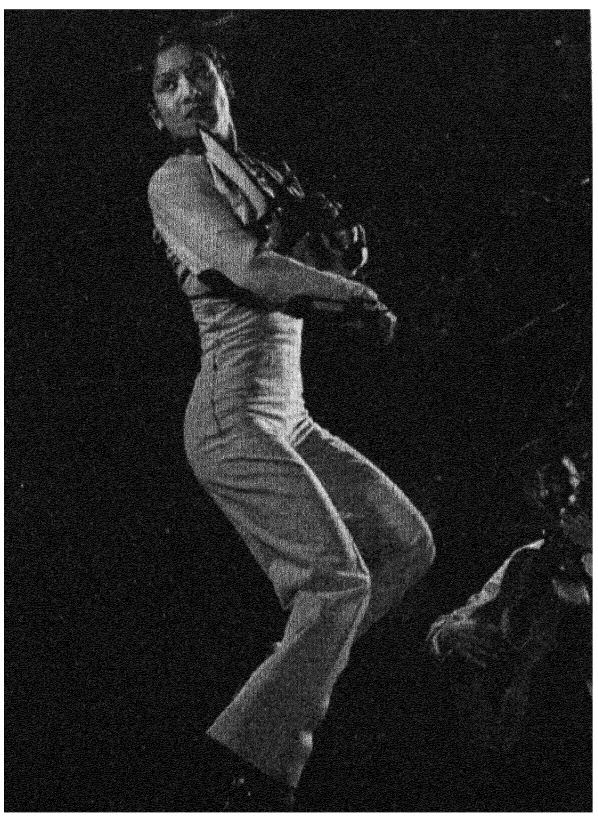


EROS VOLUSIA, exotic Brazilian dancer, was besieged with offers to tour the U.S.A. in 1941. She is shown doing a primitive witch dance

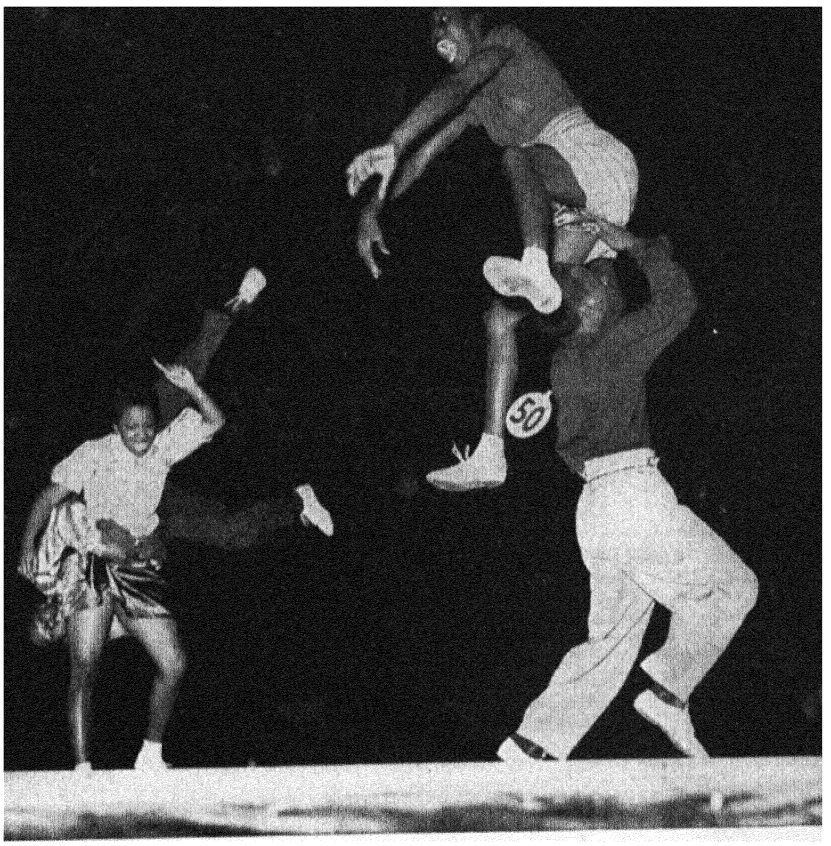


THE BALLET *Labyrinth*, with settings by the surrealist painter, Salvador Dali, had its première in New York city in the fall of 1941

CARMEN AMAYA, Spanish gypsy dancer, scored great triumphs in 1941 during her first U.S. tour



NEGRO CONTESTANTS performing the "boogie-woogie boost" in the annual Harvest Moon dancing contest in New York city Aug. 27, 1941. Some 20,000 spectators attended the finals



From a bird's-eye scanning of this wholesome social activity for the young, middle-aged and old, two important factors of influence stood forth: first, the infectious enthusiasm of individuals in the field of education, of national societies, or just "folk" indigenous to their countryside, whose influence spread through their writings, the radio or through the great festivals; second, the planned program and efforts of organizations and agencies of national scope. Among them were some government agencies, namely, the recreation divisions of the Work Projects administration, of the Federal Security and the Farm Security agencies; also, the Agricultural Extension service which, with the state agricultural colleges, works through the rural recreation specialists, 4-H club leaders and home demonstration agents. Outstanding among private organizations active in this field were the National Grange, the American Farm Bureau federation, the Co-operative League of America with its many affiliates, the Co-operative Recreation service, the international institutes, the National Recreation association, the American Association for Health, Physical Education and Recreation, the National Federation of Music clubs, the American Folk Dance society, the Country Dance society, the Methodist Youth and other denominational church youth organizations, the American youth hostels, the labour unions, the Campfire Girls and the Girl Scouts of America.

The year 1941 showed the increase in interest in many ways. More people than ever before gathered in city, country and college for regular weekly dances, more folk dancing was introduced into social dance events, more leaders were trained in special institutes or rose naturally from the ranks of the dancers, and there was a far greater demand upon the outstanding leaders to conduct institutes or give demonstrations with their groups. Because of the speeded-up demand there was, of course, some very poor dancing and leadership. Much of the grace and style innate in all true folk dancing was, in many instances, sacrificed to speed. An important trend was a growing awareness of Latin-American forms. Successful use was made of square and folk dancing in the recreational program of the armed forces of the United States.

Among festivals and institutes in 1941 might be listed: the Twenty-third Santa Fe fiesta, N.M. (first decreed in 1712, revived in 1939); the Twentieth Inter-Tribal Indian ceremonial, Gallup, N.M.; the Ninth International festival, Vancouver, B.C.; the Sixth Illinois Farm Sports (and Folk) festival, Urbana, Ill.; the Fifth Course in Square Dance Calling, Rural Youth conference, Storrs, Conn.; the Fourth Corn Huskin' Bee and All Campus Folk festival, Texas State College for Women, Denton, Tex.; the Fourth Little Rock Playgrounds' festival and numerous other county festivals throughout Arkansas and the First Arkansas State Folk and Patriotic festival, held in the portico of the state capitol; Third American Western Square Dance institute, University of California at Berkeley, Calif.; the Second Country Dance course at the Berkshire Music centre, Lenox, Mass.; the First Eastern Co-operative Recreation Training school, West Park, N.Y.; the Farmer's Week Square Dance festival, University of Ohio, Columbus, O.; the International festival, Oakland, Calif.; the French Canadian Handicraft festival (including square dancing), Quebec, Que.; the Portuguese Espiritu Santo festivals throughout central California, May through October; the Tulip festival, Holland, Mich.; the Basque Sheepherders' Christmas ball, Boise, Ida., drawing Basques from Idaho, Nevada, Utah and Oregon; the Invitation Dance and Athletic meet (Mormon), Brigham Young university, Provo, Utah; the Western Square Dance Nights during the Central City (three-week) Play festival, Colorado (historic, dating to the '70s); the Los Posadas and Los Pastores, ancient Spanish religious festivals, San Antonio, Tex., and elsewhere in the southwest at Christmastime; the Blessing of the Shrimp Fleet, an ancient French tradition, Mardi Gras, Rice, Sugar-Cane and Cotton festivals, all in Louisiana; the Square and String Dance festival at the 74-year-old Tunbridge, Vt., September fair; the Finnish Folk Dance Summer course, Kaleva Island, Eveleth, Minn.; the Ozark festivals and regular dance groups in Missouri and Arkansas; the May festivals and short courses in several Virginia colleges; the Eastern Co-operative League institute at Massachusetts State college, Amherst, Mass. Since the Texas Centennial in 1936 many annual festivals sprang up all over the state. During 1941 there were 14 harvest festivals, 21 pioneer festivals and ten flower festivals. The 1941 school roll call in the Detroit area showed 12,925 pupils receiving regular instruction in American quadrilles from leadership trained in Henry Ford's Greenfield Village, Dearborn, Mich., by Mr. and Mrs. Benjamin Lovett.

Some of the events held for the first time in 1941 follow: Berea College Summer School of Recreational Activities, Kentucky; Summer School in Early American Dancing, University of Michigan; Western Folklore conference, University of Denver; Short Course in American Dance and Song, Detroit, Mich.; International Folk Dance series, Los Angeles Public library; Pan-American festival, San Francisco, Calif.; Study Course "Folk Dances of Many Lands," Greenwich house, New York city; weekly dances and seasonal festivals (international), Community Folk Dance centre, New York city; Co-operative League workshops, training courses and play co-ops in many eastern and middle western cities and towns. (P. PA.)

Ballet, a popular theatrical dance attraction which played longer engagements to larger audiences than formerly, but necessarily confined its major operations to the western hemisphere, and by reversal of seasons as well as summer work, gave a practically continuous performance during 1941. There were many shifts of personnel among the several companies, which, including smaller ensembles, numbered in 1941 at least nine headquartered in the U.S.

The Ballet Russe de Monte Carlo, Leonide Massine, artistic director, gave outdoor performances at the Lewisohn stadium, N.Y., the Hollywood Bowl, Calif., and stopped in Hollywood long enough to make two Technicolor shorts for Warner Bros.—*Gaité Parisienne* and *Capriccio Espagnol*. The fall season opened early in October with a three weeks' engagement at the Metropolitan Opera house, when three novelties were presented: a second surrealist ballet, the Massine-Dali *Labyrinth*, Massine's *Saratoga*, and a restaging by Alexandra Fedorova of the third act of *Swan Lake*, called *The Magic Swan*, which was quickly dropped from the repertoire. The roster of principals and soloists was somewhat reduced, Toumanova, newly joining, and Krassovska, remaining, replacing Markova and Slavenska. At the conclusion of the New York engagement the company resumed its annual trans-continental tour under management of S. Hurok.

Colonel W. de Basil's Original Ballet Russe continued to meet with adventure and misadventure. After touring the United States well into the spring (following a prolonged New York engagement when premières were given works first produced in Australia and New Zealand the year before) they set forth for South America, with a stopover in Havana. There occurred what is probably the first strike in ballet history. It resulted in Hurok's breaking off relations with the company. The South American tour was cancelled, and most of the members were stranded in Cuba for the summer. In late August the reorganized company gave a series of outdoor performances at Washington's Watergate, thence to Canada (bookings by Fortune Gallo) with prospects of a U.S. tour to begin early in 1942. A notable acquisition was ballerina Nana Gollner.

As the Jooss ballet returned in June from a year in South America, Lincoln Kirstein's American ballet set out for a six months' good-will tour of the same territory, including Brazil, Uruguay, Argentina, Chile, Peru, Ecuador, Colombia and Venezuela in its itinerary. Panama, Puerto Rico, Cuba and Mexico were scheduled but finally excluded because of increasingly uncertain conditions caused by the spread of war. The membership combined dancers from Kirstein's American Ballet Caravan, the former American ballet and other companies, headed by Lew Christensen, Marie-Jeanne, Gisella Caccialanza and William Dollar. Among new works presented were Balanchine's *Ballet Imperial;* Christensen's *Pastorela*, on a Mexican theme, in which he was assisted by José Martinez and José Fernandez; Tudor's *Time Table;* and Dollar's *Juke Box*. New works on South American themes, done with the collaboration of native painters and musicians, were created en route.

The Jooss ballet opened at the Maxine Elliott theatre, New York, in September, giving New York premières to *Chronica* and *A Spring Tale* and the revised *Prodigal Son*, all by Kurt Jooss, during a five weeks' engagement there. For the first time in its history a choreographer other than Jooss was called upon when the American, Agnes de Mille, did *Drums Sound in Hackensack* (which had its world première during the New York season) for them. The company played two additional weeks at the Windsor theatre and was scheduled to play Schubert theatres throughout the United States. Thirteen nationalities were said to be represented in this onetime German company. While in South America, several of the men left to join the British military forces. Rudolf Pescht and Ernst Uthoff took posts in the Chilean government's ballet school in Santiago, Chile. Lucas Hovinga, Alfredo Cordino, Richard Wyatt, Marguerite d'Anguerra and Lavinia Niehaus were new additions to the cast. Jooss and Leeder in England removed their school from South Devon to Cambridge and were awaiting transportation to the United States.

Ballet Theatre played a short New York winter season and was then comparatively inactive until summer, when a goodly portion of the cast took part in the International Dance Festival and School conducted by Dolin and Markova at Jacob's Pillow, Ted Shawn's estate in the Berkshires in Massachusetts. There, Baronova, who had been appearing on and off with both Russian companies, joined them, and her husband, Gerald Sevastianoff, became general manager. The company, reorganized under Hurok, opened its third season in Mexico City in October and in November under the combined sponsorship of Hurok and the New Opera company, played the first two weeks of its engagement at the Forty-Fourth Street theatre, New York, continuing thereafter until the middle of December under Hurok management alone, their first transcontinental tour scheduled to begin early in Jan. 1942. New works presented were Fokine's *Bluebeard*, Vania Psota's *Slavonika*, Dolin's rearrangement of parts of *The Sleeping Princess* and Nijinska's revival for the first American performance of her *La Bien Aimée* (*Beloved*). Nijinska also restaged *La Fille Mal Gardée*, which in the general Anglicization of titles became *The Wayward Daughter*. Several soloists from the two Russian companies joined these ranks—Jeannette Lauret, Rosella Hightower, Ian Gibson, George Skibine and Yura Lazovsky among them.

Laurent Novikoff was appointed ballet master for the Metropolitan Opera, Boris Romanoff, the former ballet master, planning to form his own company, according to announcements. Igor Schwezoff, who came to the United States with the de Basil company and later took his own studio in New York, was ballet master for the New Opera company's New York season.

The Littlefield ballet, Catherine Littlefield, director, was official ballet for the Chicago Opera season, with a tour running into 1942 following. The San Francisco Opera ballet, under William Christensen, extended its annual tour as far east as Cleveland. The Graff ballet, headed by Grace and Kurt Graff, spent the summer at headquarters, Fieldstone, Newfane, Vt., giving programs in their own Playbox and in near-by towns, and preparing for the fall tour which opened in October. Ruth Page and Bentley Stone with an augmented company made a second tour of South and Central America during the summer months, and in December appeared at Radio City's Rainbow Room.

Eugene Loring, formerly of Ballet Theatre, the American ballet and Ballet Caravan, and later star of Saroyan's *The Beautiful People*, organized and put into rehearsal a new company of 16 dancers to be called Dance Players, Inc., for the purpose of presenting original works on American themes by collaborating American artists. Lew Christensen of the American ballet and Janet Reed of the San Francisco Opera ballet, joining him. The New York debut and a preliminary tour were planned for the spring of 1942.

Dance Index, a noncommercial monthly to be devoted to discussions of dance and dancers by leading writers, first publication scheduled for Jan. 1942, was founded by Kirstein. The *American Dancer*, the oldest dance magazine in the U.S., and *Dance*, the newest (up to *Dance Index*), improved and prospered along with the increased public interest in all forms of dance.

Dance Archives staged a Pavlova and a Duncan memorial exhibit among others. Kirstein conducted a scholarship contest at his School of American Ballet. Glenway Westcott received the book award for his *The Dream of Audubon*, David Diamond the musical award, in Ballet Guild's competi-

tion for a new American ballet, the award in décor was held up by union rules. Lillian Moore of the Metropolitan Opera ballet, took a company of 12 dancers for festival performances at San Juan, P.R., in October. Margarete Wallman continued at the Colon, Buenos Aires, Arg.

A short film of the Leningrad ballet, starring Tschabukiani, was shown in the United States. Zorina in *Louisiana Purchase* was transferred from stage to screen. Ballet continued among models for Disney cartoons, including the new *Dumbo. It Happens on Ice*, in second edition, *Icecapades* and *Ice Follies* kept ballet among other forms actively on ice. Irving Deakin continued radio talks begun early in 1937. Petroff and Gollner of the Original Ballet Russe made a television broadcast, and late in 1941 Platoff, Rostova and Delarova left Russian ballet for the new musical show, *The Lady Comes Across*.

In England the diversion of blitz to the Russian front helped ease the situation. But two fine dancers, Harold Turner and Frederick Ashton, joined the R.A.F. Arnold Haskell, the original balletomaniac, patrolled "one of the loveliest roads in England." The Vic-Wells ballet played at the New theatre, produced Ashton's *The Wanderer*, Ninette de Valois's *Orpheus and Eurydice* and toured the provinces; the Ballet Guild produced Keith Lester's *The Dark Mirror;* the Rambert-London ballet Frank Staff's *Czerny 2*, among many activities centred in London but radiating through the provinces, which included the founding of a new International Ballet company and of the Anglo-Polish ballet. The *Dancing Times* continued to publish regularly in spite of paper and labour shortage.

Concert dance in the United States during 1941 existed more by the will to live than by any great financial success or backing. Although the best dancers drew their own audiences in large numbers, the single or paired recital was less remunerative than the weekly theatre engagement; and society favoured the more sumptuous ballet for sponsorship. Only a few solo or duo dancers were able to make the journey to South America.

In fact, in the early part of the year business looked fairly dull for the leading moderns in the United States. All continued to teach to eke out a living, sometimes giving master courses or lecture-demonstrations on tour.

Martha Graham, with her company, gave the usual New York concerts, revising to brilliant success her *Letter to the World*, first produced at the Bennington festival the summer before, but did not widely tour. In the spring she contracted with the new WGN Concerts management for a nation-wide tour to begin in the fall. It was at the Bennington festival that she came into her own, for there she produced her new dance comedy, *Punch and The Judy*, which with *Letter to the World* and *El Penitente* carried off all honours.

Doris Humphrey and Charles Weidman, with their company, maintained the repertory season well into the spring at their new studio-theatre in New York, offering among new works Miss Humphrey's *Song of the West* and a revival of *The Shakers* as well as several humorous pieces by Weidman. Miss Humphrey as chief choreographer for the Bennington festival of 1941 there produced her full-length suite, *Decade*, an autobiography of the Humphrey-Weidman career, quoting from the repertoire of a decade or more. After a brief fall tour, the new repertory season opened during the Christmas holidays, when *Decade* and Weidman's *Flickers* were scheduled for first New York performances.

Hanya Holm and her company presented in New York *The Golden Fleece, an Alchemistic Fantasy*, with theme and costumes by the surrealist painter, Kurt Seligmann, and spent the summer (on leave of absence from the Bennington festival) teaching and producing at Colorado college, reopening her New York studio in the fall.

Helen Tamiris conducted a repertory season at her New York studio, producing new works. Anna Sokolow, returned from two years in Mexico City, gave New York performances and toured. Argentinita and her Spanish Ensemble made fewer appearances, but Spanish dance was active in studio and night club performances.

There was much activity throughout the United States with a filtering into Canada and South America. Miriam Winslow and Foster Fitz-Simons made the most extensive tour of the latter terrain, returning after several months to become the first concert dancers to appear in New York's Rainbow Room, and beginning a new United States tour in December. Paul Draper, who had tapped successfully to classical music in a touring theatre-concert program with his aunt, Ruth Draper, played an engagement in Rio de Janeiro, Braz. Jack Cole appeared with his dancers in New York night clubs and later in Rio. The single prominent importation from South America, the flamenco dancer, Carmen Amaya, made her North American debut in the New York night club, The Beachcomber, and after a long run toured motion picture theatres as a unit in stage shows, appearing also in a short film.

While the concert dance in its highest estate may be said to have arrived at the theatre in its best sense, the direction of the younger concert dancers during 1941 was into popular forms of theatrical entertainment—night club, revue, musical comedy, motion picture, radio and television—whether from desire for variety or the stark necessity of earning a living wage. A splendid array of young moderns danced in the stage hit, *Lady in the Dark*. Katherine Dunham, of *Le Jazz "Hot,"* the concert program and the stage show, *Cabin in the Sky*, made, with her company of Negro dancers, a short subject in Technicolor, *Carnival of Rhythm*, for Warner Bros. Angna Enters, dance-mime, contracted with RKO for her debut screen role in *Passage from Bordeaux*, and with MGM to direct from her own script, *Mama's Angel*. Winslow and Fitz-Simons made a television broadcast, as did Corinne Chochem, the latter in dances on Hebraic themes. Humphrey and others gave radio talks on modern dance.

On the Pacific coast, Lester Horton and his dancers continued as the leading modern group; Mills college conducted its annual summer dance session; José Limon (a former Humphrey-Weidman dancer), drafted and deferred, gave duo performances with May O'Donnell (a former Martha Graham dancer); Devi Dja and her Bali-Java dancers supposedly brought their "farewell tour," from the east, through the southern states, to a close; Carmalita Maracci, returned from her midwinter eastern tour, taught and prepared new programs for the December concert season in New York.

Meanwhile, important events in the concert field took place before war came to the United States. In the summer Ruth St. Denis revived her debut program of 1906 for the International Dance festival at Jacob's Pillow, and later, with other famous dances from her repertoire added, in a New York concert series in 1941. Withdrawing from the School of Natya, she took a studio formerly occupied by Isadora Duncan, there to conduct a salon of dance. La Meri removed the School of Natya to Riverside drive, holding monthly lecture-demonstrations on oriental dance forms, and giving a concert of Indian Natya at the Guild theatre in December. Ted Shawn, who taught and performed at the International Dance Festival and School, was appointed director of a new project, the Jacob's Pillow Festival and School, by a committee assembled to carry out plans for enlargement of the plant, and the maintenance of a summer school and festival to incorporate all kinds of dance. Shawn contracted to teach and perform for at least five years.

Distinguished solo debuts were made in New York by Barton Mumaw, of the disbanded Shawn dancers, by Emy St. Just, trained at the Jooss-Leeder school in England, and by Sybil Shearer, formerly of the Humphrey-Weidman company. Mumaw began a nation-wide tour as soloist in October.

Concert dance in the United States took on new life in the fall of the year, with many new plans and projects, although the Selective Service act threatened to make inroads in the supply of younger men dancers. Franziska Boas, New York modern dancer and creative percussionist, organized a seminar of lectures on "The Function of Dance in Human Society." The Wadsworth Atheneum of Hartford, Conn., announced a series of lectures and performances by noted dancers and dance-musicians. *Dance Observer*, a monthly magazine originally devoted to modern dance but including other contemporary forms, established a service bureau for presenting dancers and discussing their problems in a regular column of questions and answers.

In England there was little opportunity for visiting concert dancers, and modern dance has never got much of a foothold there. But a window looking out on the American field was kept open in the "New York Letter" of the *Dancing Times*, and in special articles, photographs and discussions of the great American modern dancers—Martha Graham, Doris Humphrey and Weidman. Wigman and Kreutzberg were still dancing in Germany, at least during the earlier part of the year.

Danube, Control of.

On March 1, 1939, Germany was given a seat on the International Danubian commission, while Rumania was accorded full sovereignty over the lower reaches of the river. On Sept. 17, 1940, Germany abolished the commission and replaced it with a "consultative committee" on Danubian affairs, under a permanent German director, Dr. George Martius. This committee was composed of delegates from Italy, Hungary, Bulgaria, Yugoslavia and Slovakia. In July 1941, two months after the fall of Belgrade, a new German Danube Navigation company assumed complete control of all navigation on the river, and thus abolished the last vestiges of the international regime established in 1856. (S. B. F.)

Darlan, Jean Louis Xavier Francois

(1881–), French naval officer and statesman, was born Aug. 7 at Nérac, France. He entered the navy in 1899 and during World War I commanded a battery of naval guns on the western front and participated in operations on the Balkan front. In July 1918 he returned to the sea as captain of a warship. After the war, he advanced through the grades to vice admiral and was commander in chief of French naval forces, 1939–40. With the fall of France in June 1940, Darlan was named navy minister in the Pétain government. An ambitious politician, he rose swiftly in the Vichy cabinet, superseding Pierre Laval (*q.v.*) and Pierre Etienne Flandin in the favour of Marshal Pétain.

On Feb. 9, 1941, Darlan became vice-premier and took over the foreign ministry and interior portfolios; he also became heir apparent to Pétain's mantle as chief of state. Shortly thereafter he dismissed army, navy and government officials who did not support his pro-axis policies. He frequently negotiated with nazi authorities concerning the terms of German occupation, and on many another occasion he gave evidence of his willingness to collaborate with Germany in the European "new order." (*See* also FRANCE.)

Dartmouth College. An institution of higher learning at Hanover, New Hampshire. The total student enrolment in 1941 was 2,426, only five less than in the preceding year. The number of faculty and administrative officers was 327. When the U.S. declared war against the axis powers in Dec. 1941, the college took immediate steps to speed up its program to permit students to finish their work for the bachelor's degree before entering military service by (1) allowing seniors to take a special comprehensive examination if ordered to report for duty; (2) giving special examinations to seniors and underclassmen called to service to complete their first semester work; (3) eliminating the winter carnival, house parties and the Easter vacation, and advancing commencement day from June 14 to May 10; (4) planning a summer session (Dartmouth previously had not had a summer school) to permit greatly accelerated progress toward the degree.

The 25th anniversary of President Ernest M. Hopkins' administration was celebrated in 1941. The annual Dartmouth alumni fund campaign, devoted to recognizing the anniversary, raised $196,000. (S. C. Ha.)

Daugherty, Harry Micajah (1860–1941), U.S. lawyer and politician, was born Jan. 26 in the town of Washington Court House, O. He graduated from the University of Michigan and began the practice of law in Columbus, O. In 1921 he was appointed attorney general by President Harding. His tenure in office was stormy; he was named in the Teapot Dome scandal, and a senate investigating committee declared he had dealt in Sinclair oil after he had entered the cabinet. He was exonerated by the house judiciary committee of a 14-point charge demanding impeachment. He was twice prosecuted for alleged conspiracy to defraud the government in obtaining allowance of a claim of $7,000,000 against the alien property custodian; the jury disagreed in each case. He resigned in March 1924. After his retirement, he wrote a book defending himself and the Harding regime against charges of corruption. He died Oct. 12 in Columbus, O.

Daughters of the American Revolution. The national society, Daughters of the American Revolution, organized Oct. 11, 1890, makes eligibility for membership dependent upon direct descent from a patriot who aided in securing American independence. Membership Dec. 1, 1941, approximated 143,000 in 2,554 chapters in every state and in many countries. President general, Mrs. William H. Pouch; headquarters, Memorial Continental hall, Washington, D.C.

Activities of 1941 included gifts of $100,000 for 14 approved schools for foreign born and southern mountaineers. Improvements for the schools consisted of a new high school building at Tamassee, additions to high school building at Kate Duncan Smith and improvements to model farm. Two of these schools, Tamassee in South Carolina and Kate Duncan Smith on Gunter mountain in Alabama, with approximately 700 pupils, were completely owned and operated by the D.A.R.

Other activity for the year included instruction in the use of leisure and respect for rights of others to 255,584 children in Junior American Citizens clubs; distribution of about 300,000 manuals for citizenship, in 16 languages, to aid in naturalization; 5,000,000 tiny Penny Pine trees were planted in all states of the Union, in co-operation with the U.S. forest service with memorial forests in 40 states. Loans made to students through the D.A.R. student loan fund totalled 5,362. Three social workers were maintained in the detention rooms at Ellis island and for occupational therapy among men of the coast guard and merchant marine confined in the Marine hospital. A high school senior from every state, winner of the Good Citizenship contest, was given a trip to Washington. Motion pictures were previewed and informative lists circularized. About 58,000 copies of the *National Defense News*, designed to promote confidence in fundamentals of the American form of government, were distributed. Distribution of Flag Codes and other patriotic literature reached into hundreds of thousands. The society publishes the *National Historical Magazine*. Through some 1,400 clubs, the society furthered its educational endeavours through training in girl Homemaking. By use of a national catalogue, papers of historical import were loaned to the some 2,500 chapters. A genealogical library of 32,000 volumes and an early American museum are open in the society's headquarters, Memorial Continental hall, Washington, D.C. (H. R. P.)

Davenport, Eugene (1856–1941), U.S. agriculturist, was born June 20, in Woodland, Mich. The son of a Michigan farmer, he worked his way through the Michigan Agricultural college. In 1891–92 he was president of the Collegio Agronomica in São Paulo, Brazil. In 1895 he became dean of the college of agriculture of the University of Illinois and launched experimental farm stations at Urbana and in other parts of the state. He organized farm associations, developed crop rotation and wrote several books and articles on breeding and statistical evolution. He retired in 1922. Dr. Davenport died in Woodland, Mich., March 31.

Davies, Sir Henry Walford (1869–1941), British organist and composer, was born Sept. 6 at Oswestry, Shropshire, England. Famous for his leadership in musical education in England, he was appointed master of the king's music in 1934. For the jubilee of King George V and Queen Mary, he arranged the program for the command performance at Albert hall, London, and set to music John Masefield's *A Prayer for the King's Majesty*. When George V died, Davies wrote a musical tribute which was performed by the London Philharmonic orchestra at the Royal Choral society's memorial service. He was co-editor of the "service book" of music played at the coronation of King George VI and Queen Elizabeth in May 1937. He died at his home near Bristol, March 11. (See *Encyclopædia Britannica.*)

Davis, William Rhodes (1889–1941), U.S. oil operator, was born Feb. 10 in Montgomery, Ala. He attended Stark college but left before graduation to work as a candy butcher on a railroad. In 1913 he organized an oil company in Oklahoma. After World War I, during which he served in the A.E.F., he returned to the Tulsa boomfields and rose from a small-scale wildcatter to the position of an influential oil "czar." By 1938 his holdings included fields in Texas, an oil refinery in Hamburg, Germany, and oil storage facilities in the Scandinavian and Baltic states. He was the go-between, in 1938, in the barter deals between Mexico and the axis powers, whereby the latter secured huge oil reserves prior to the outbreak of war in 1939. In the fall of 1939 he submitted peace proposals, assertedly drafted by Marshal Goering, to the U.S. state department. The proposals were widely publicized by Verne Marshall, head of an isolationist group. Davis died in Houston, Texas, on Aug. 1.

DCB: *see* Defense Communications Board.

Deafness. **Hearing Aids.**—Individuals who have difficulty in hearing conversation at a distance of six feet

or less in relatively quiet places as in the office or home may be helped by wearing a hearing aid. Clinical examinations of a hard-of-hearing person should include audiometric tests and will usually indicate to the otologist whether the patient will be benefited enough by an aid to warrant the expense of a purchase.

Two types of electrical hearing aids were on the market in 1941: (1) the telephone or carbon granule microphone hearing aid and (2) the vacuum tube hearing aid employing a crystal microphone.

The trend seemed to be away from the telephone or carbon granule type of hearing aid. The vacuum tube hearing aid usually weighs approximately 10 oz. complete and consists of a small crystal microphone and a miniature vacuum tube amplifier built in a wearable case (2 oz.), A and B batteries (7 oz.), a receiver (1 oz.) and wire connections. The receiver may be of two types: air conduction, a small button which fits closely in the better ear; or bone conduction, a receiver which rests on the mastoid and is held in place by a spring headband. An otologist's examination generally determines which type of receiver will give the most satisfaction to the patient.

The cost of operating the aids depends largely on the number of hours the aid is in use—roughly speaking, it costs $2.00 per month for battery upkeep.

Although there are methods and instruments designed to help the fitter select an aid for the hard-of-hearing person, these procedures have not been perfected and the most satisfactory method in 1941 was to try the aid on the hard-of-hearing person.

A list of accepted hearing aids may be obtained from the Council on Physical Therapy of the American Medical association. A list of requirements on which the acceptance of these hearing aids is based also may be obtained from the council's office on request.

(H. A. C.)

Death Ray: *see* GRINDELL-MATTHEWS, HARRY.

Deaths (of prominent persons in 1941): *see* OBITUARIES.

Death Statistics.

Final reports show that there were 1,417,269 deaths in the United States during 1940, and that the corresponding death rate was 10·8 per 1,000 of total population. This figure is somewhat higher than that for 1939, which was the lowest yet recorded in that country, namely, 10·6 per 1,000. Provisional data relating to 42 states and based on records for the first six months of 1940 and 1941 indicated a 3% improvement in mortality in 1941 over 1940. Canada recorded 110,648 deaths in 1940, with a death rate of 9·7 per 1,000 population. This established a slight rise over the death rate for 1939, and the indications were that there might have been a further increase in 1941. This conclusion is based upon a 3% increase in deaths in 67 cities and towns in Canada during the first half of 1941 as compared with the same period in 1940. During 1940, England and Wales experienced 572,882 deaths and had a death rate of 14·3 per 1,000 total population. This death rate is the highest reported for England and Wales for any year since the influenza pandemic of 1918, when the rate stood at 17·3 per 1,000 population. The figure for 1940 is 18% higher than that for 1939 and 23% above that for 1938, the last prewar year. However, it is quite likely that the record for 1941 will be better than that for 1940, for data relating to the great towns and extending from January through August of each year show a 4% decrease in deaths.

Death rates for the principal English-speaking countries since 1921 will be found in the accompanying table. During almost all of this period, the best showing was made by New Zealand, followed closely by Australia and the Union of South Africa.

Mortality statistics among the belligerent countries may never be recorded accurately, but it is quite evident that since the war began in Sept. 1939, there has been a general rise in death rates as the result of abnormal conditions. This is clear from the record just cited for England and Wales. During 1940, the civilian population alone of England and Wales suffered 23,081 deaths as a result of aerial bombardments; this accounted for 4% of the total deaths for the year. In addition to these casualties, there were 19,151 such deaths from January through August of 1941. In contrast, only 1,117 civilians were killed in aerial attacks on Great Britain during all of World War I. The greatest number of fatalities resulting indirectly from air raids arose from highway accidents during blackouts. There were 11,424 such deaths in the first 15 months of the war, or 3,141 more than in the preceding 15 months of peacetime.

Annual Death Rates per 1,000 Total Population in the Principal English-speaking Countries, from 1921 to 1940

Year	United States	Canada	England and Wales	Scotland	Northern Ireland	Eire	Australia	New Zealand*	Union of South Africa (whites)
1921	11.6	11.6	12.1	13.6	15.3	14.4	9.0	8.7	10.4

*Europeans excluding Maoris.

The war also had an effect on certain morbid conditions. Thus, deaths from cerebrospinal fever in London rose from 31 in the first 50 weeks of 1939 to 156 in the corresponding period of 1940; the increase is attributed to overcrowded conditions in air-raid shelters. In London in the same period, an increase of about one-third in mortality resulting from ulcers of the stomach and duodenum is ascribed partly to nervous strain experienced by the people subject to air raids. On the other side of the picture, maternal mortality in England and Wales in 1940 was 2·6 per 1,000 live births, the lowest on record for the country.

Mortality from tuberculosis always tends to increase under wartime conditions. In England and Wales, mortality from this disease increased by 13% from 1939 to 1940 among men and by 7% among women. Scotland reported an increase of 14%, reaching the highest rate recorded since 1932. There was also a significant rise in mortality from tuberculosis in Canada during the first half of 1941. These rises are attributed to lowered resistance to the disease among the population and to an increase in contacts between tubercular and nontuberculous persons. Loss of resistance results from malnutrition, unusually long working hours, and the strain of factory labour, particularly upon young women who have never been engaged in such work before. Contacts between victims of the disease and healthy members of the community increase because of overcrowding as a result of homes having been destroyed by bombs, because of a shortage of housing for workers transplanted to areas where new war industries are set up, and because of a shortage of hospitals and hospital facilities which have been assigned to the military forces.

Within the United States, the highest death rates in 1940 were found principally among the states of the east, while the lowest rates were generally in the central and western areas. Thus,

Vermont had a death rate of 12.8 per 1,000 population; New Hampshire, 12.7; Maine, 12.5; Delaware, 12.2; and Maryland and Florida, each with 12.1. Nevada also had a high death rate, namely 12.7 per 1,000. North Dakota made the best showing with a death rate of 8.2 per 1,000 population, followed by South Dakota, with 8.5; Wyoming, 8.5; Arkansas, 8.7; Oklahoma, 8.8; and Utah, 8.9. New York state had a death rate of 11.1 per 1,000. Since the foregoing figures are crude death rates, based only upon total deaths and total population, they are affected by differences in the age, sex and racial constitution between the populations of the states.

Provisional mortality statistics compiled for 41 states in 1940 show that diseases of the heart resulted in 289 deaths per 100,000 of population and that the death rate from cancer was 118 per 100,000. Death rates per 100,000 population from other important causes were as follows: cerebral haemorrhage, embolism and thrombosis, 90; nephritis, 76; total accidents, 70, of which automobile accidents accounted for 24; pneumonia, 54; tuberculosis, 44; diabetes mellitus, 26; and influenza, 15 per 100,000.

An insight into the mortality situation for the first nine months of 1941 may be obtained from the experience of the millions of industrial policy-holders of the Metropolitan Life Insurance company. According to this experience, new low records for 1941 would be established for pneumonia, tuberculosis, appendicitis and suicides. The improvement in mortality from pneumonia is especially noteworthy, the 1941 death rate being only one-half that of the like period in 1937; the reduction is attributed to the new treatment of the disease by chemotherapy. Improvements in mortality for the first nine months of 1941 compared with the same period in 1940 were also noted for scarlet fever, diphtheria, diabetes, diseases of the puerperal state, the cardiovascular-renal diseases and homicide. There was a sharp increase in mortality from measles and a slight increase in whooping cough. Influenza and cancer also showed increases. A sizeable increase in the accident death rate is attributed largely to the expansion of industrial activity in connection with the national defense program, with a consequent rise in industrial accidents. Defense, National (U.S.).

The year 1941 opened on the keynote of the closing months of 1940. U.S. public opinion differed on nearly every item of public concern. Interventionists and noninterventionists alike beat their drums from the public rostrum and over the far-flung waves of the radio. The "Land of the Free" was living up to its name. But the year 1941 closed on a note of national solidarity which the most optimistic would scarcely have predicted. Dissenting opinions and pet isms were cast into utter discard in the face of the emergency which arose when Imperial Japan attacked the great base at Pearl Harbor, Hawaii, on Dec. 7, 1941. The following day, in answer to President Roosevelt's message, personally delivered before a joint session of both houses, the congress declared that a state of war existed between Japan and the United States. On Dec. 11, similar action was taken in naming Germany and Italy as formal enemies of the U.S. The die was cast, and the nation stood united with but one ultimate commitment, the complete and final destruction of a world tyranny which stood manifest in the aims of Hitler, Mussolini and the Japanese war-party government.

The days and weeks preceding Dec. 7, 1941, had witnessed much progress toward the aim of improved national defense. Plans for a bigger and better army were bearing fruit; navy policies and navy construction were advancing toward the goal of an adequate two-ocean navy; civilian effort was being guided into productive channels to meet the demands of the rapidly changing picture; obsolete governmental theories and practices were crumbling and disappearing as they menaced progress. The nation, in spite of much hindering soapbox oratory within and without congressional halls, was advancing sensibly toward a better measure of national defense.

Repeal of the Neutrality Act.—Early in July 1941, U.S. forces landed in Reykjavik, Iceland. Previously, British forces had been withdrawn from this area in considerable numbers. To leave the area unoccupied would have been to invite German seizure and subsequent destruction of U.S. shipping carrying aid to Britain over the north Atlantic sea lanes. At the time of U.S. occupation, the president announced that substantial forces had already been sent to bases in Trinidad and British Guiana in order ". . . to insure the safety of communications in the approaches between Iceland and the United States *and all other* strategic outposts." The italics are especially pertinent when the occupation of Dutch Guiana later in the year is recalled. In the latter incident, protection of enormous bauxite deposits, basis of aluminum, was the motivating factor.

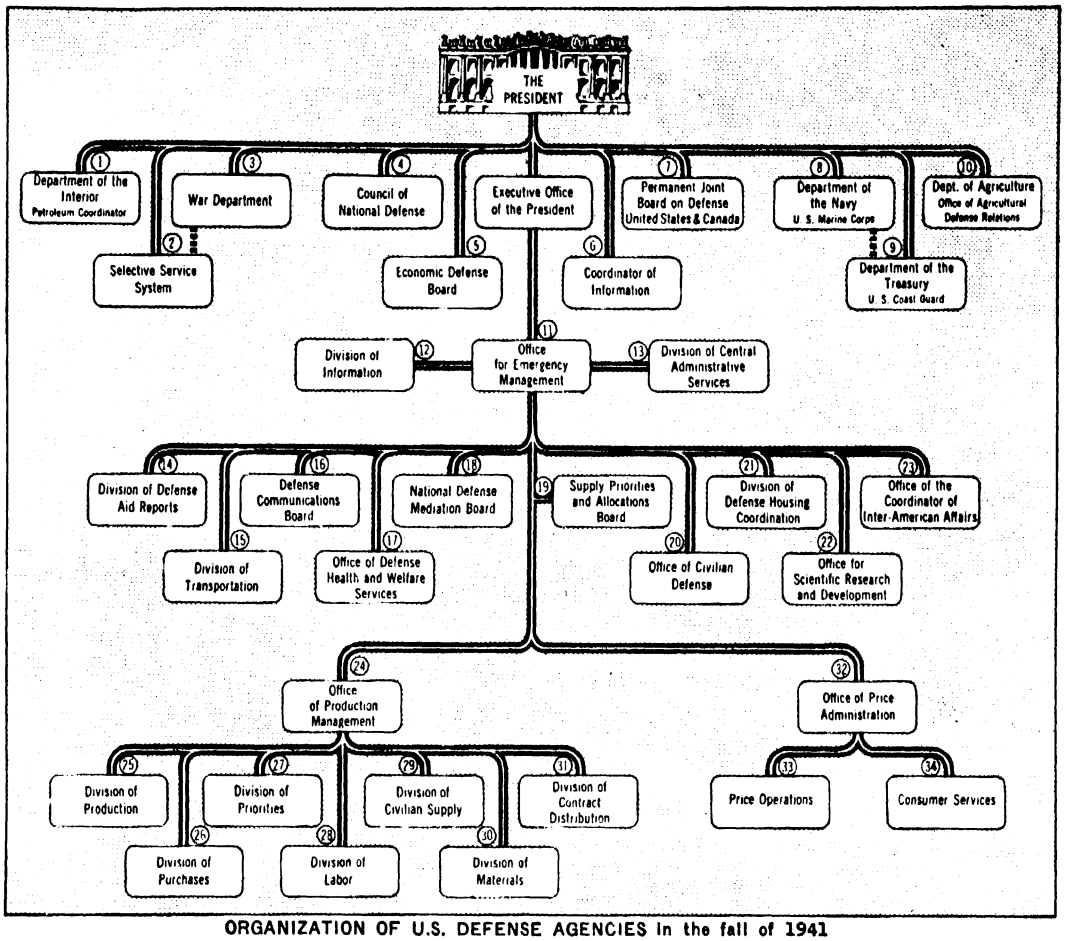
Prior to the occupation of Iceland, the S.S. "Robin Moor," a U.S.-owned vessel under Panaman registry, had been sunk May 21, 1941, by a nazi submarine. The United States seized all axis assets and closed 25 German consulates. Successively the "Sessa" (Aug. 17), the "Steel Seafarer" (Sept. 7) and the "Montana" (Sept. 11) became nazi targets. Carrying the U.S. flag, the "Greer" was next attacked, and in October the U.S. suffered its first casualties when the destroyer "Kearny" was fired upon and hit. After the "Greer" incident, orders went out to the navy to shoot axis raiders on sight if they were operating in American defensive waters.

The prospect of continuing a neutrality act in operation began to look dark indeed. Merchant ships, under the existing act, could not be armed, neither could they enter previously declared war zones. Yet, going about their business, they became enemy targets and were liable to being sunk. In 1917, Pres. Wilson admitted the failure of the nation's then-existing neutrality policy. Its conception was founded on two assumptions: (1) that by formal legislation before hostilities others could be discouraged from making war, and (2) that should war come, the U.S. could shelter itself behind a barrier of neutrality by legislation. The year 1941 found the U.S. ultimately in no better fix than in 1917 with respect to this policy.

After much oratory, the Neutrality act, conceived in 1935, rewritten in 1937 and 1939, went into the discard in 1941, the house voting 212–194 in November to eliminate restrictions imposed by it on cargo vessels. (*See* also NEUTRALITY.)

Other items of legislation of importance in the defense picture in 1941 included: (1) the amendment of the Selective Service act, (2) the passage of the Lend-Lease act, and (3) the enactment of a new male Registration act. In the first instance, service of conscripts was lengthened from 12 to 30 months; the ban on service outside the continental limits of the United States was later raised. Original aid to Britain had taken the form of an exchange of destroyers for military bases. By passage of the Lend-Lease act, March 11, 1941, the president was authorized to manufacture in

U.S. shipyards and factories those weapons, munitions, aircraft and vessels of all kinds required to be of definite help to European democracies contending against Germany. Title of goods involved could be transferred to those nations whose battle lines were defending U.S. production lines. As soon as passed, this act was implemented by a $7,000,000,000 appropriation. Later in the year, more money was provided as needed. New registration legislation included listing of all males from 19 to 64 and requiring, if necessary, military service from those aged 20 to 44. (*See* SELECTIVE SERVICE.)



ORGANIZATION OF U.S. DEFENSE AGENCIES in the fall of 1941

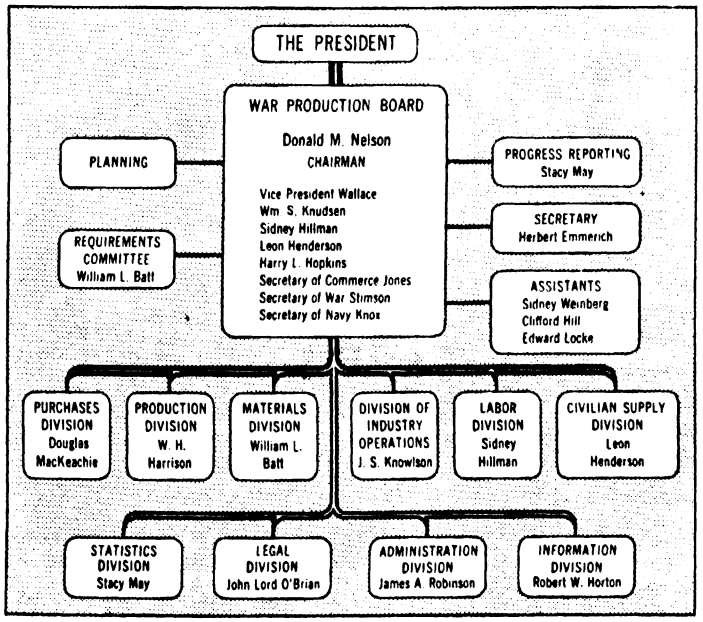
Armed Forces.—*Army.*—The purely military problem of national defense in 1941 was concisely stated by Secretary of War Stimson (*q.v.*) when he appeared before the Truman committee of the United States senate in April. He said that it was necessary to: (1) create large forces trained to operate in a war of movement; (2) train those forces for a new kind of mechanized warfare; and (3) build everything the U.S. forces needed, since, unlike 1917–18, no other nation stood ready to sell these things. The record of the year shows that considerable progress was made toward these objectives.

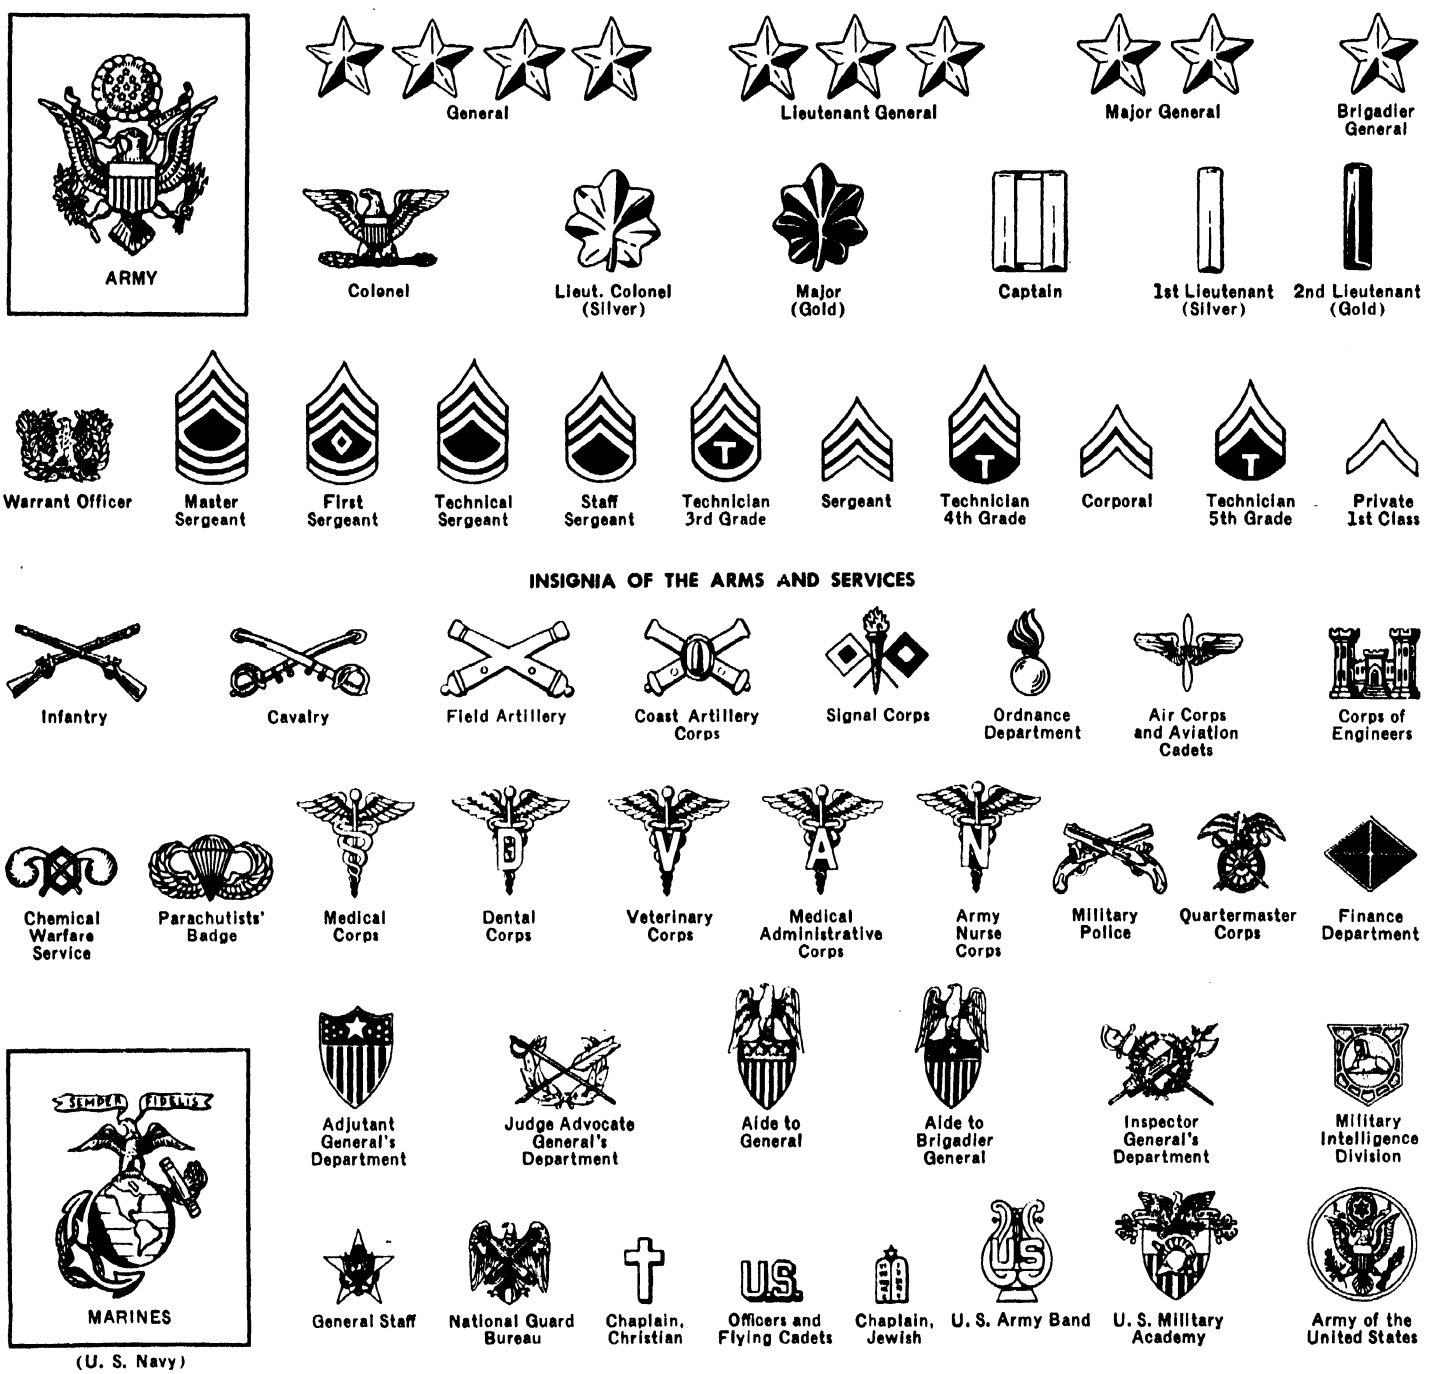
When the year ended, there were approximately 1,600,000 troops in the army; the national guard (*q.v.*) was completely in federal service; new military units—parachute troops, air-borne troops, ski troops, mountain troops, armoured motorized units, mechanized units, tank units, balloon barrage units and others—had been created. Training of this new, huge body of troops had included manoeuvres on a scale never before attempted in the United States. Starting early in the year with regimental terrain problems, this active-duty training had progressed to corps manoeuvres, followed by army manoeuvres in the Louisiana area and in the Carolinas. For these, G.H.Q., under the direction of Lieut. Gen. Leslie McNair, had formulated military problems for solution by the army commanders. For the first time, the four-army plan marched off blueprints onto battlefields. The manoeuvres were unique in that they were "free." There were no preliminary scenarios with foreknown situations and reactions. Instead, shortly before "D" day, commanders involved were given the military problem and told they were on their own. The stimulus to initiative was obvious. Gen. McNair summarized the year's manoeuvres in the Dec. 1, 1941 issue of the *New York Times*, in an article by Hanson W. Baldwin: "The United States army, given complete equipment, could fight effectively. . . . We have made splendid progress. But the simple fact is that you can't perfect units in one year's work."

However, some salient lessons were learned—the mass use of tanks; the effectiveness of mobile massed guns against tanks; the need for infantry to accompany armoured divisions; the necessity for the creation of more motorized divisions; the fact that ground troops must learn to be sensible of the real threat of air attack; and that discipline must be improved. In the equipment field, the manoeuvres demonstrated the need for speed-up in production of anti-aircraft guns, with their equipment and ammunition; the pressing need for long-range, low altitude pursuit planes capable of long air patrols; and the importance of producing more medium tanks.

Back of this peak point in the military program of 1941 lay the spade work which had provided for assimilating drafted men in 29 reception centres, where they were classified, uniformed, and then distributed among 21 replacement training centres for basic training. The ground forces thus being created provided for four armies of nine army corps including 29 divisions, an ar-

ORGANIZATION of the War Production Board as announced January 21, 1942





U. S. ARMY INSIGNIA

moured force of four divisions, troop units for Hawaiian, Philippine, Puerto Rican and Caribbean areas, and a supplemental air force expanded in October to 84 combat groups. This force had to be prepared to fight in any climate, under any conditions, since the globe had become the military sphere of action. The public is accustomed to see the ultimate trained soldier as a snappy, alert, uniformed, armed man. To bring him to that point and fit him as an integral unit of national defense, many lines of effort must be followed to their conclusion. It is necessary to survey and secure camp sites, build camps and cantonments, formulate adequate tables of organization, design and produce all needed uniforms, produce all necessary ordnance, and train the civilian recruit in the use of tools of the profession of arms.

Mechanized and motorized equipment was produced in 1941 in greatly increased quantities—tanks, reconnaissance cars, self-propelled artillery, armoured cars. Ordnance equipment, carbines, grenades, rifles, anti-aircraft and anti-tank guns, howitzers, gas masks and like items kept pace in flowing out to troops in finished form. (*See* also MUNITIONS OF WAR.)

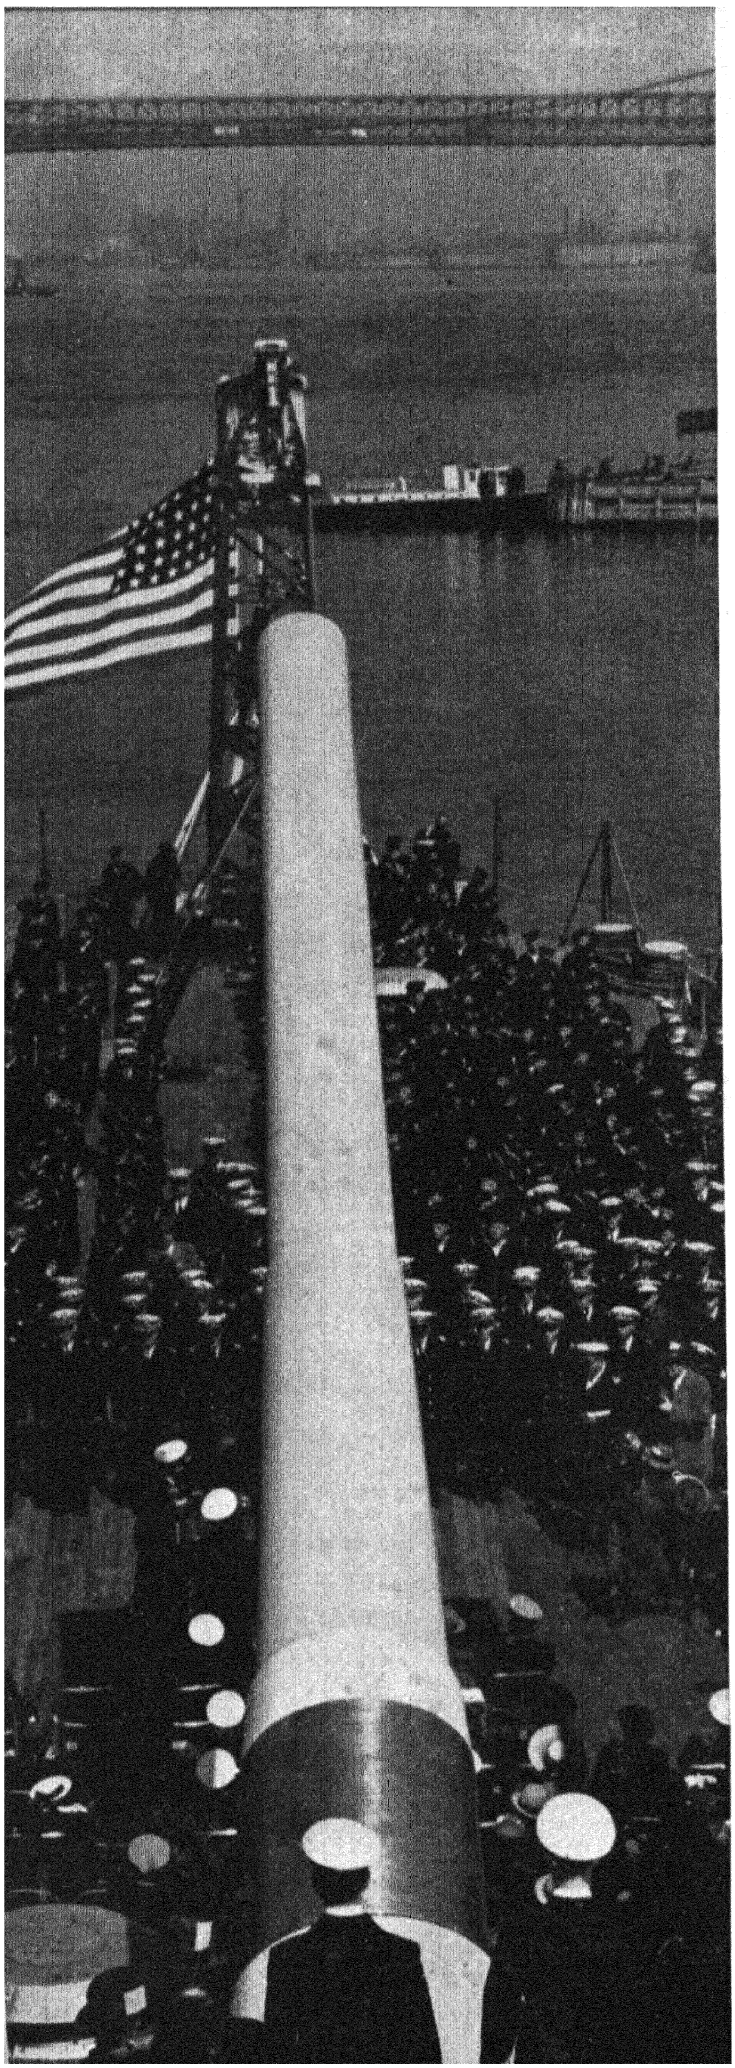
Outlying troop garrisons soon showed the influence of the expanded military defense program. Alaska's previous garrison of a few hundred was increased to several thousand; strength in Panama was more than doubled; less than a normal thousand in Puerto Rico jumped to over 10,000. Other numbers of troops were sent to Dutch Guiana, Iceland, Newfoundland, Bermuda, Trinidad, Jamaica, Saint Lucia, Antigua, British Guiana and the Bahamas to make effective the military bases on British territory

in the western hemisphere.

Certain statistical data and comparisons show some of the army's progress toward better national defense during 1941. On June 30, 1940, aggregate army strength was under 300,000; on June 30, 1941, it was 1,462,347; the engineer corps, taking over construction responsibility from the quartermaster corps, undertook projects aggregating construction costs of more than $4,000,000,000; the air corps increased in numbers of personnel until it stood second to the infantry in size; arrangements were perfected for assuring an army food supply costing $750,000 a day; as a transportation achievement, 28,839 carloads of freight and 1,139,199 men were moved by the quartermaster corps; money appropriated to Nov. 1, 1941 for ordnance items totalled $3,181,500,000; powder manufacture was increased 1,000% and small arms ammunition 1,200% in 1941; land under control of the secretary of war for military purposes jumped from 2,500,000 ac. in 1940 to more than 10,000,000 ac. in 1941; army chaplains were increased in number from 600 to 1,550; national guard strength rose to over 300,000; in April 1941, 1,427 planes were manufactured; in September, their production crossed the 1,850 mark, a figure more than three times that for production in Aug. 1940. For World War I the U.S. spent a total of $22,000,000,000; by May 1941, the U.S. had spent or appropriated nearly $52,000,000,000, and *was not then at war.*

(*See* also ARMIES OF THE WORLD.)

Air Force.—The question of creating a separate U.S. air force was one which evoked considerable comment during 1941. In a newspaper dispatch released on Nov. 10, Undersecretary of War



Robert P. Patterson stated the war department's opposition to congressional agitation for creation of a wholly independent air force as a third division of the armed forces. He asserted that a separate air force would mean a "triplication" of army and navy efforts, without any corresponding multiplication of effectiveness. He stressed the necessity for teamwork in any military organization, and rated the U.S. army air forces as the finest in the world, since they combined the best features of Britain's R.A.F. and the nazi *luftwaffe*. In answer to citation of the R.A.F. as demonstrating the value of an independent air force, Patterson said, ". . . the independence of the R.A.F. was probably a factor in the loss of Crete, because division of command meant division of effectiveness. Here an inferior German force won a signal victory with an organic air force—an air force, that is, which was not operating independently, but as an integral part of a task force which included land and sea units."

Citing the fact that all of the Atlantic bases in the Caribbean area, air and ground troops alike, had an air officer in command and that the same situation was true of the U.S. forces in Newfoundland, he disposed of the charge that the air force was being subordinated.

(*See* also AIR FORCES OF THE WORLD.)

Navy.—This arm of U.S. defense had before it in 1941 a clear-cut program—the achievement of a two-ocean navy, a balanced force which, when complete, would present the greatest array of naval fighting power ever assembled. At the close of 1941, the naval defense program was not only up to schedule but ahead in many phases. The program of expansion afloat and ashore had been kept in balance in spite of exigencies which had thrown exceptional loads on certain points. Notable in this regard was the necessary repairing of British vessels coming into U.S. waters for overhaul.

With respect to shore facilities, the bureau of yards and docks showed at the end of 1941 that there had been no lag in schedule of any of the original base projects planned. With the exception of Trinidad and the Bahama islands, all base locations obtained from Great Britain in the trade for old destroyers in Sept. 1940 were either in partial or complete operation.

The record of the navy's expansion in aviation shore establishments was outstanding. From seven such establishments extant in 1939, the number in 1941 was brought up to 30, supplemented by additional auxiliary bases and training stations. Those completed in 1941, and those projected, were to take care of a 15,000-plane program. The first basic advance was made in this field in 1940, when use was made of a special $7,000,000 appropriation to provide facilities to operate the aviation patrol for the enforcement of neutrality.

The construction of a major naval air station or base usually requires 2,000 ac. to 2,500 ac. of land bordering on water suitable for the landing and taking off of seaplanes. Berthing of aircraft carriers may be necessary in some cases. A landplane area a mile square or larger is needed; also the necessary space for hangars, shops and other shore adjuncts.

The naval air stations at Quonset point, R.I., and Corpus Christi, Tex., were striking examples of the possibilities of pressure accomplishment. The contract for Quonset was signed in July 1940; construction costs were estimated at $24,000,000. The normal time of construction would have been two or three years, but the station was commissioned July 12, 1941.

Corpus Christi, at an approximately equal cost, was also contracted for in July 1940. It was commissioned in March 1941; a class of fliers who had received their preliminary instruction at

THE 35,000-TON U.S.S. "NORTH CAROLINA" was commissioned at Brooklyn navy yard April 9, 1941. This battleship, the first built in the U.S.A. since 1923, carries nine 16-in. guns

auxiliary naval reserve air bases was graduated from Corpus Christi in 1941.

However, establishment of naval air stations was not an easy matter. Many knotty problems were faced, since the geographic range included the subarctic regions, where many feet of frozen peat had to be removed before even temporary structures might be built, and the tropics, where dense jungles had to be cleared before initial work could be undertaken.

The speed with which the navy was accomplishing construction of its outlying and lend-lease bases in 1941 had a very direct bearing on defense of not only the main coast line of the United States, but also the vital Panama canal area. The most northern of these defenses was located in Newfoundland, with the line extending south with the establishment of bases in the Bahama islands, at Bermuda, Antigua, Saint Lucia, Trinidad and Georgetown in British Guiana, supplemented by additional stations located at San Juan, P.R.; Saint Thomas in the Virgin islands; Kingston in Jamaica; and expansion of the existing base at Guantánamo, Cuba.

The program for development of an air base in Midway island was completed far ahead of schedule, and exceptional speed was registered in developing Alaskan air bases at Sitka, Kodiak and Dutch Harbor.

Another major Pacific project on which outstanding progress was made was the great drydock at Pearl Harbor in Hawaii. The dock, "in the dry," was basically complete and capable of taking any of the navy's battleships or aircraft carriers in 1941. The Kaneohe air base on the island of Oahu was in operation, and, prior to the Japanese assault on Dec. 7, 1941, much improvement work had been completed at Palmyra and Johnston islands.

On June 30, 1940, personnel of the navy on active duty was 157,986; on Nov. 1, 1941, the corresponding total was 311,861. The marine corps (*q.v.*) in the same period climbed from 27,958 to 64,053. The coast guard (*q.v.*) which became a part of the navy, had on Nov. 1, 1941, a military personnel of 23,879, a civilian personnel of 4,990, and 282 vessels of all classes.

The total tonnage of combatant type vessels, the striking power of the floating navy, under construction July 1, 1940, was 823,335. In Oct. 1941 this figure had jumped to 2,138,590 tons.

Table I.—*U.S. Combatant Ships*

Type	November 1941			June 1940		
	Built	Building	Total	Built	Building	Total
Battleships	17	15	32	15	10	25
Aircraft carriers	7	11	18	5	3	8
Cruisers	37	54	91	35	10	45
Destroyers	170	192	362	219*	48	267
Submarines	113	73	186	95	25	120
Totals	344	345	689	369	96	465

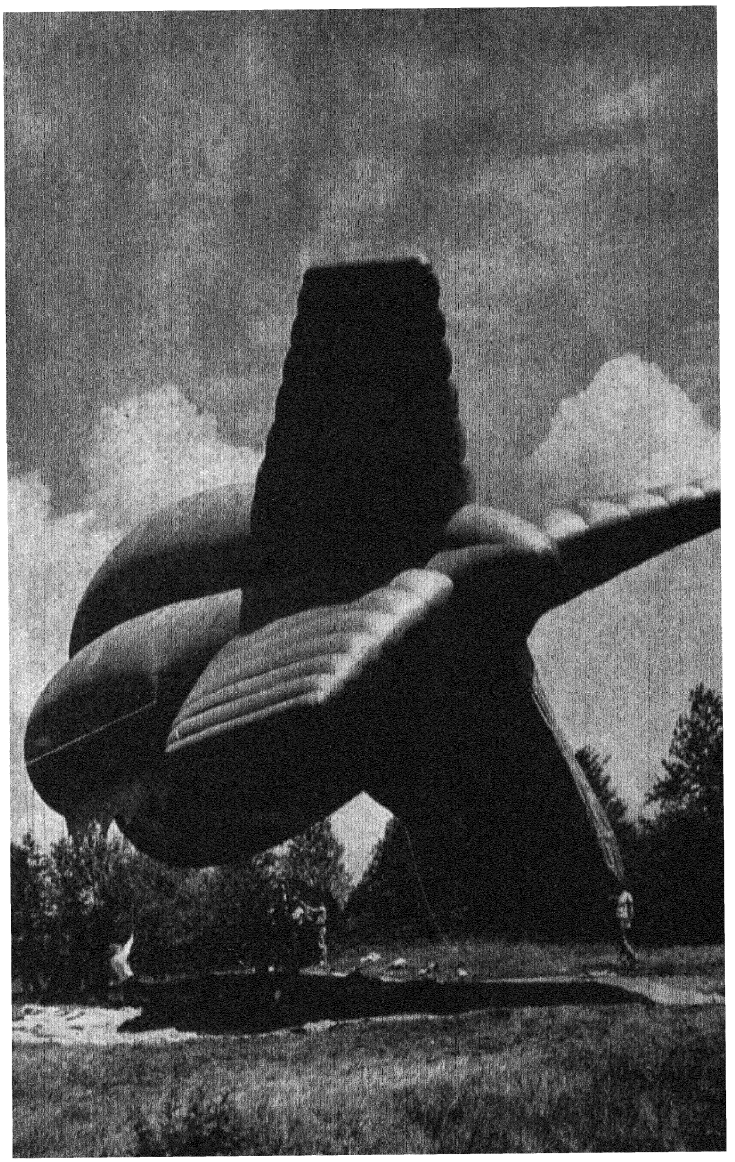
*Fifty destroyers included here were transferred to Great Britain in 1940.

The bureau of yards and docks expended $420,851,562 in the fiscal year 1941, as against $81,864,734 in the previous fiscal year. A total of 712 contracts amounted to $603,199,632 in 1941 as compared with 688 contracts involving $183,762,017 in 1940. Drydock construction for 1941 doubled that of 1940 and involved approximately $200,000,000.

Table II.—*Construction Progress of U.S. Combatant Ships in 1941*

Type	Commissioned	Launched	Keels laid
Battleships	2	3	2
Aircraft carriers	1	0	3
Cruisers	0	6	17
Destroyers	13	18	75
Submarines	10	13	23
Totals	26	40	120

As for general construction by the U.S. navy, a total of 41 new section bases for local defense operations was undertaken in 1941, and 27 were completed and in use at the end of the year. All ammunition depots were greatly expanded, and construction was



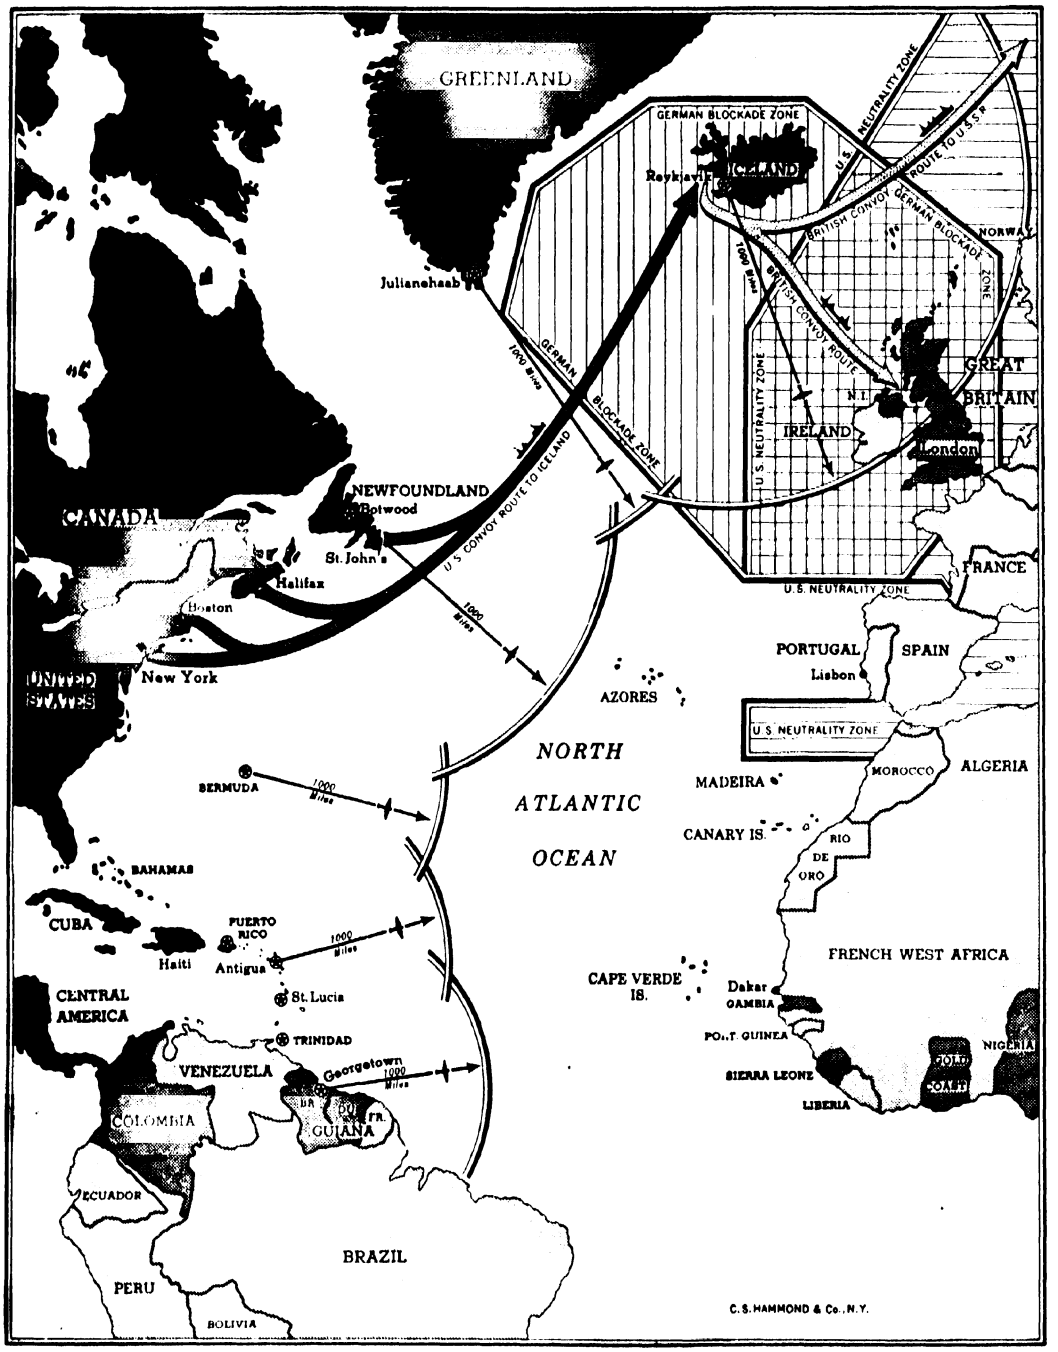
ANCHORING a U.S. barrage balloon after a test flight near Akron, Ohio in 1941. A training school for ground crews was established during the year at Camp Davis, N.C.

begun on six new ones. Three new submarine bases were commissioned, and three others were under construction in 1941. For the marine corps, two new bases were under construction on the Atlantic coast and two major fleet supply depots neared completion.

Indicative of the navy's rapid expansion in 1941 was the fact that contracts in the fiscal year 1941 totalled $2,196,980,630.51, or an 800% increase over the preceding fiscal year. (*See* also NAVIES OF THE WORLD.)

Missions to Other Countries.—A military mission was sent to China, headed by Brigadier General John Magruder. Later in the year, tentative overtures were made toward extending lend-lease aid to Turkey. However, that nation declined, announcing its intention to preserve its neutrality. Near the close of December, a military mission was sent to the Russian capital at Kuibyshev. This group was headed by Major General John N. Greely, son of the famous arctic explorer.

Defense Agencies.—A study of civilian activities in connection with national defense immediately leads to consideration of the Office for Emergency Management (*q.v.*), an administrative device. This body, responsible directly to the president, included, at the end of 1941, the Office of Production Management (*q.v.*); the Division of Administration; the Division of Central Administrative Services; the Lend-Lease administration (*q.v.*); the Defense Communications board (*q.v.*); the National Defense



FACTORS IN THE BATTLE OF THE ATLANTIC before U.S. entry into the war in Dec. 1941. U.S. convoys to Iceland could not enter the prohibited neutrality zone (proclaimed Nov. 4, 1939) but had to pass through the blockade zone proclaimed by Germany against Great Britain. The map also shows the effective range of planes from the various bases leased by Great Britain to the U.S., and from Reykjavik, Iceland

Mediation board (*q.v.*); the Supply Priorities and Allocations board (*q.v.*); the Division of Defense Housing Co-ordination; the Office of the Coordinator of Inter-American Affairs; the Division of Transportation; the Office of Defense Health and Welfare Services; the Office of Scientific Research and Development (*q.v.*); and the Office of Price Administration (*q.v.*).
